The WORLD of the PRESENT

• NORTH POLAR AZIMUTHAL EQUIDISTANT PROJECTION •

THE FLAG WAVES OVER IWO JIMA

On February 23, 1945, five U.S. Marines and a U. S. Navy man battled their way to the dominating crest of Mt. Suribachi, and planted Old Glory on the crater's rim. In this picture of Felix W. de Weldon's statue in Washington, D.C., Pharmacist's Mate 2/c John H. Bradley, one of the three survivors, surveys the sculptor's representation of his comrades and himself. The statue was inspired by and modeled after the famous unposed photograph taken on the spot by Joe Rosenthal, Associated Press Photographer.

THE AMERICANA ANNUAL

AN ENCYCLOPEDIA OF THE EVENTS OF 1945

*To the Men and Women who served in the
Armed Forces of the United States during the
Second World War, and especially to those who
gave their lives for the preservation of American
freedom, this volume is respectfully dedicated.*

foreword

FOR THE PAST SIX YEARS the Second World War has been the dominating theme of each issue of *THE AMERICANA ANNUAL*. In this issue, though the war has ended, much space has again been devoted to the conflict and to its aftermath. The bloodshed stopped when the "cease firing" orders were given only to be followed by turmoil and discord superimposed upon fear and consternation growing out of the greatest scientific achievement of all time—the development of atomic energy. The resulting condition is almost as appalling as the war itself.

In Europe and Asia hunger, cold and pestilence stalk alike the victors and the vanquished; in China civil war plagues the people of that peace-loving country; India seethes with unrest; terrorism reigns throughout Palestine; a revolt is underway in Iran; revolution has broken out in Java where the natives are attempting to overthrow Dutch rule; Greece is having her troubles; France is in the throes of political upheaval; and here, in the United States, strikes and threats of strikes have upset the entire reconversion program.

Also, as a result of the war, a large part of the world is bankrupt—ruined primarily by two mendacious and power-hungry dictators and a group of military oligarchists. One of these dictators has met a violent death at the hands of his own people; the other, the number one war criminal, is believed to have taken his own life rather than face the consequences of his iniquity. At least two of his collaborationists have been executed after trial; several of his satellites have gone the suicide route, while the fate of others is being determined by courts of justice.

Because of the rapidly shifting scene from war to peace to chaos, the presentation of all the pictures in the global kaleidoscope has been a difficult task. Nevertheless, we are confident that for all in search of factual information relating to the events of 1945, the 1946 *AMERICANA ANNUAL* will prove a thoroughly reliable record.

In this edition many new names have been added to the list of *AMERICANA ANNUAL* contributors. Among them is that of Maj. Erwin Ch. Lessner, noted military authority and historian, who writes authentically on the War, Germany, Japan, and Hitler.

Another newcomer is Mr. Vladamir D. Kazakévich, widely known lecturer and teacher, who has contributed one of the most informative articles on Soviet Russia yet to appear in print. Still another authority who contributes to THE ANNUAL for the first time is M. Roger Duhamel, lawyer and journalist, who discusses the events taking place in the France of today.

Other new contributors include Mr. David Leong, of the Chinese News Agency, who writes with first-hand knowledge of China and her troubles; Prof. A. N. Christensen, of the University of Minnesota, who gives a graphic picture of strife-torn Argentina; Dr. W. V. Houston, of the California Institute of Technology, who tells all that the government will permit to be told about the development of the Atomic Bomb; and Mr. Witt Bowden, who describes Labor Conditions in the United States. This by no means completes the list of new contributors; space limitations preclude naming the complete roster.

Indicative of the scope of THE ANNUAL attention should be called to the following outstanding articles: Aeronautics, Agricultural Research, Amphibious Warfare, Chemistry, Education, Electronics, Food Research, Medicine, Naval Progress, Painting and Sculpture, Radio (including Radar), Sociology, Surgery, Television, Tropical Diseases, War Policy of the United States, World Politics, X-Ray, and the separate articles on the various countries of the world. THE ANNUAL also contains an unusual number of biographies of prominent persons.

To the contributors, new and old; to the hundreds of United States, foreign, state and local officials who so cheerfully supplied an enormous amount of the information contained in this volume; and to every member of the editorial staff, the editor acknowledges his indebtedness and his appreciation of their support and loyalty.

ABDULLAH, Achmed (full name Achmed Abdullah Nadir Khan el-Durani el-Iddrissyeh), Russian Afghan short story writer, novelist, and playwright: b. Kabul, Afghanistan? May 12, 1881; d. New York City, May 12, 1945. Truth and fiction mingled equally in most of the activities of this writer of dashing tales of romance, intrigue and adventure. He kept his real name a secret, and it was claimed that he was the son of Grand Duke Nicholas Romanov and Princess Nourmahal Durani. In his autobiography, *The Cat Had Nine Lives* (1933), Abdullah stated that he was educated at Eton, Oxford, and the University of Paris; and spent long years in the British Army, serving in the Far East, the Near East, Africa, and France. He went to the United States in 1924. He wrote for English, American, and French magazines; published some 27 books; and was the author of a number of plays, including *Toto* and *The Grand Duke*, and motion pictures, the best known being *The Thief of Bagdad* and *The Lives of a Bengal Lancer*. His principal books were *The Red Stain* (1917); *The Blue-Eyed Manchu* (1917); *The Trail of the Beast* (1919); *Alien Souls* (1921); *Steel and Jade* (1927); *The Romantic Young Man* (1932); *Deliver Us From Evil* (1939); and with Fulton Oursler, *The Shadow of the Master* (1940).

ABRASIVES. The output of the abrasives industries in 1944 totaled 1,340,909 short tons valued at \$34,403,056, and was only slightly under the 1,365,632 tons valued at \$35,829,658 of 1943, according to the United States Bureau of Mines. Ground sand and sandstone, and metallic abrasives rose to new highs. The average annual sales of diatomite for the three-year period 1942-44 were substantially higher than for similar periods in the past. Market production of emery, pumice and pumicite, and tripoli were larger than in 1943. Domestic production of most of the other natural abrasive products was somewhat less in 1944 than in 1943.

The value of natural abrasives produced in the United States in 1944 amounted to \$9,575,038. The value of artificial abrasives produced in 1944 was \$24,828,018, including material produced in Canada. These figures compare with \$9,631,657 and \$26,198,001 respectively in 1943.

ACADEMY OF POLITICAL SCIENCE. An international learned society for advancing the political sciences and their application to political, economic and social problems, founded in 1880 in New York City and incorporated in 1910. Its membership on Aug. 31, 1945, numbered approximately 9,281, of whom eight were honorary members, 328 life members, and approximately 7,753 individual members and 1,200 subscribing members, chiefly libraries and organizations. At the semiannual meeting on April 4 and 5, 1945, in New York City, "World Organization—Economic, Political and Social"—was discussed. At the 65th annual meeting held on November 8 at the Hotel Astor, in New York City, the topic discussed was "European Recovery." The following officers were elected for 1945: Lewis W. Douglas, president; Thomas J. Watson and Leo Wolman, vice presidents; Noel T. Dowling, secretary; John A. Krout, editor of publications; Sam A. Lewisohn, treasurer; and Miss Ethel Warner, director and assistant treasurer. Headquarters: Fayerweather Hall, Columbia University, New York City.

CAROLINE D. MONNOT,
Assistant to the Director, Academy of Political Science.

ACCIDENTS AND ACCIDENT PREVENTION. Accidental deaths during the first six months of 1945 totaled 44,000—5 per cent less than the 1944 comparable total of 46,100. Motor vehicle deaths decreased 1 per cent; occupational deaths dropped 7 per cent. Public nonmotor vehicle deaths were about the same. All of which seemed to hold at least a faint promise that the 1944 twelve months total of 95,000 accidental deaths might be pared somewhat when the final reckoning for 1945 came up. But, ironically enough, the sweeping victories on the far flung battlefronts—the nation's joy at the tensely awaited word that "it's all over"—seem to signal a bitter defeat on the home front, unless everyone "takes it easy."

As this is written, only motor vehicle figures are available beyond the half-year mark. They are not encouraging. America's gas starved motoring population got a little bonus on June 22—a little loosening of the gas ration. In July, the nation's traffic toll shot up 15 per cent over the same month of 1944. Impending events cast their shadows—the 15 per cent rise in July was heralded by an 11 per cent increase in June.

Safety people the nation over feared a big postwar traffic headache. They have it already—with Nippon's acceptance of the Potsdam declaration still ringing in their ears. A 1 per cent decrease in the traffic toll for the first seven months stands only because of substantial decreases early in the year, before the trend did an

about face. It all adds up to the fact that the wartime record of low traffic death tolls is over—unless the driver and the pedestrian will it differently.

Safety work country-wide during 1945 has topped even the record expansion of the last full war year of 1944. The activities of the National Safety Council and its affiliated state and community organizations continue to grow, along with the accident prevention efforts of industry, schools, and government and private agencies of many kinds.

Wartime meeting and travel restrictions forced a break in the long line of National Safety Congresses—the year's show place of organized safety work nationally. Cancellation of the 34th National Safety Congress and Exposition affected hundreds of sessions that had been planned, dealing with all phases of safety—sessions that annually attract over 10,000 of the people who make the nation's safety programs deliver results.

One of the first things that millions of soldiers will want to do will be to climb behind the wheel of an automobile and go places. They—along with other millions of civilian motorists, who have grown rusty with rationed driving, will be driving not too youthful cars over roads that have had little more than breakdown maintenance. These men will also be returning to peacetime jobs that are new and strange to them, in an industrial development that will produce a host of new problems of health and safety. These things make imperative greatly increased efforts to beat down the postwar toll of accidents. The safety movement has a challenging job ahead.

R. L. FORNEY,

General Secretary, National Safety Council.

ADVENT CHRISTIAN CHURCH. According to the denominational *Manual* for 1945, the present membership is 32,540 (including foreign mission fields), with 466 churches and 411 ordained ministers. The Sunday-school membership (including foreign mission fields) is 22,018. There is also a young people's society known as Loyal Workers; and several Young People's Institutes are conducted at summer campmeetings. The largest campmeeting, which is at Alton Bay, N.H., lost about 300 cottages and several larger buildings by fire, Aug. 23, 1945. Work in foreign fields is carried on through the American Advent Mission Society and the Woman's Home and Foreign Mission Society. Aurora College, at Aurora, Ill., is a fully accredited college and grants degrees in arts, science, theology, and music; president, Dr. T. P. Stephens. The New England School of Theology, of Brookline, Mass., trains pastors and missionaries; president, Dr. Guy Linwood Vannah. A home for aged ministers and their wives is maintained at South Vernon, Vt., and a home and orphanage at Dowling Park, Fla. The oldest denominational paper, *The World's Crisis*, has been published since 1854; present editor, J. A. Nichols, Jr. A series of *Blessed Hope Quarterlies* are published for the Sunday school. The present editor, Dr. Linden J. Carter, has served in that capacity for the past 30 years. Among the other denominational periodicals are *Messiah's Advocate*, *Present Truth Monthly*, and *Advent Christian Missions*. Dr. Lee E. Baker, of Oakland, Calif., is president of the

General Conference, while Dr. C. H. Hewitt, 165 Calumet Ave., Aurora, Ill., is the general secretary.

LINDEN J. CARTER,

Editor, Blessed Hope Quarterlies.

ADVERTISING. Like practically all phases of business, advertising was affected profoundly during 1945 by the end of the war and the preparation for a peacetime economy. War effort advertising tapered off sharply during the latter part of the year, institutional advertising, too, showed a sharp decline; while the presentation of consumer products and advertisements, designed to develop a reception for products when they might become available, gained in volume. The principal developments of the year may be summarized as follows:

(1) advertising's continued support of the war effort;

(2) advertising's adaption to the reconversion period as manufacturers began to make the transition from war to peacetime production;

(3) increase of product advertising, that is, straight selling copy on both available goods and expected future products;

(4) increasing attention to developments in the post-war economy in relation to the serviceman and his return to civilian life;

(5) economic foreshadowing of the use of new inventions and discoveries for industrial purposes.

While most of the war effort advertising came to a close toward the end of the year, two outstanding campaigns to sell war bonds deserve mention. They were the "7th War Loan Drive" and the "Victory Loan Drive." Advertising's place in the war effort was summarized in a booklet entitled *From War to Peace*, published by the War Advertising Council. According to this booklet, "American business supported more than 100 different home front campaigns" and "estimated space and time contributed, more than one billion dollars." A few highlights of this war effort advertising follows:

War Bonds: "American business (advertisers and media) contributed an estimated 350 million dollars worth of space and time in support of war bond promotion."

Food: "An estimated 100 million dollars worth of advertising contributed by business."

Armed Services: "Business contributed an estimated 80 million dollars worth of space and time for recruiting and morale campaigns."

Manpower: "Space and time contributed by business estimated at 40 million dollars."

Conservation and Salvage: "Estimated business advertising contribution for conservation and salvage messages 65 million dollars in space and time."

Other campaigns promoted were the Cadet Nurse Corps recruitment drive, Red Cross and National War Fund campaigns and civilian services.

Peacetime appeals were much in evidence during the reconversion period in the latter part of the year. Many of them were designed to stimulate people's desires for more and better things, even before consumer goods became generally available. Toward the very end of the year advertising showed signs of returning to normal with an increase in straight consumer goods advertising.

Full peacetime production with full employment is the goal toward which all America is looking in the postwar years, and advertising is being given an important place as one of the basic factors in helping to attain that goal which calls for a much higher standard of living for the great majority of our people. Currently, however, the advertising business is featuring a new-type of appeal which may be referred to as "transition advertising" to bridge the gap be-

tween war production and full peacetime production of civilian goods. Transitional advertising is being used to develop desires for products which, although not yet available, are expected to be on the civilian market before long. For example, the Ford Motor Company used transition advertising in a campaign with the theme "There's a Ford in Your Future." Wm. Wrigley, Jr. Co., gum manufacturer, anticipated its product's return to a peacetime buyer's market with an advertising campaign featuring the Wrigley gum wrapper and the slogan "Remember this Wrapper."

The lifting of all bans on automobile production and the end of gasoline rationing was the green light for major automotive manufacturers to begin to promote full-scale advertising campaigns. The automotive industry counts heavily on advertising to acquaint the public with its product and the total advertising expenditure for automotive advertising is expected to reach a record volume in 1946.

The national dimout was lifted on May 8, 1945. After three years of blackouts, brownouts, and dimouts, people were glad to see the streets bright and cheerful looking again. The illumination of outdoor advertising made it possible for that medium to serve again fully at night as well as all day.

Restaurant, amusement, and recreational facilities enjoyed a record year in 1945 and many attendance figure records were broken.

The Traffic Audit Bureau, the authority for outdoor advertising circulation figures, in much the same way as the Audit Bureau of Circulation in the magazine and newspaper field, reported that the effective circulation of outdoor advertising for the fall of 1945 was 23 per cent greater than last prewar audits.

During 1945 many conventions and meetings were held as nationwide telephone conferences—a wartime innovation to help relieve the congested facilities for traveling. With governmental restrictions on meetings lifted in September 1945, it was predicted that 1946 would be the heaviest convention year in American history. Hotels did a tremendous volume of business throughout the country with transient trade, vacationists, and servicemen and their families.

On Oct. 11, 1945, Paul W. Kesten, executive vice president of the Columbia Broadcasting System, speaking of television, announced the transmission of pictures in full color. He said, "Only yesterday, October 10th, I saw these television pictures successfully broadcast across the crowded New York skyline and received many blocks away with superb clarity, demonstrating the actual use of the ultra high frequencies and the modulation of a ten-megacycle video band—two of the things so many were so sure could not be done."

Plans were made for several new magazines to be introduced in the latter part of 1945 and early in 1946. Curtis Publishing Company announced a new monthly magazine, *Holiday*, for March 1946 and also announced plans for other new magazines. Hearst Magazines, Inc., announced a November 1945 publication date for their new magazine *Junior Bazaar*. McGraw-Hill Publishing Company announced the purchase of *Science Illustrated*, and plans for an entirely new type of science publication. Second World War veteran groups announced several new veterans' publications. Two of these are titled *Amvets* and *Veteran's Outlook*.

Retail sales made gains even with merchan-

dise shortages. Expansion was the keynote of the retailer's future. Several large department stores announced plans for branch stores throughout the country.

Food advertising in 1945 emphasized straight selling copy again as food manufacturers recognized the shift from a wartime seller's market to a peacetime buyer's market. Premium offers, prize contests, and special inducement copy—wartime casualties—showed signs of a comeback during the latter part of 1945.

During 1945 reconversion brought changes in distribution and marketing. At a meeting of the American Marketing Association on Oct. 16, 1945, Dr. Vergil D. Reed, associate director of research, J. Walter Thompson Company, predicted that "Supermarkets can be expected to increase in numbers and volume with the return of automobiles and gasoline." He said also that there will be an increasing trend toward drug and cosmetic sales through these outlets.

A number of American companies advertised in foreign countries in 1945 to reach American servicemen overseas and to create a peacetime foreign market for their products. However, the most important objective attained by this foreign advertising was the goodwill and friendship developed between the American serviceman and the advertiser.

Market studies and research were necessarily curtailed in 1945 due to lack of manpower and other wartime changes. However, some studies were made to ascertain the public's reaction to advertising. In a nationwide poll conducted by the Psychological Corporation for Index of Public Opinion, results published in July 1945 showed that of the 2,500 persons interviewed, 39 per cent thought the country would need more advertising after the war than it had before the war, while 36 per cent believed it would need about the same, and 19 per cent thought it would need less.

Indicating a trend toward worldwide interests, plans were made during 1945 for American research methods to be applied to foreign markets. Researcher Elmo Roper announced plans for research in Latin America to ascertain Latin American opinion on United States products and business policies and to extend United States methods of marketing and public opinion research to Latin America. International research plans also were formulated and surveys were begun by George Gallup in many foreign countries. Gallup polls are already operating in seven foreign countries. Purpose of the surveys is to get a broad picture of public opinion in one country with those of another on common world problems.

In December 1945, a new standard 24-sheet outdoor poster panel was adopted by the Board of Directors of the Outdoor Advertising Association of America, Inc. In the new panel the poster proper is given greater size.

At the third quarter of 1945, advertising volume was running about 2 per cent ahead of the same time in the previous year. It is expected that the year's total percentage gain will be well over the 1944 figure. Of all the major media, outdoor advertising enjoyed the biggest gain in 1945—up 40 per cent—as compared with 1944.

Not much improvement was noted in the paper shortage situation. Reduced government demands will improve the supply in 1946; although the law of supply and demand will pre-

vent the increase from being large for some time.

Scientific discoveries and developments such as radar were explained to the general public through the medium of advertising.

In September 1945 the War Advertising Council announced a comprehensive public service plan under the peacetime name of the Advertising Council. Plans involve the expenditure of at least \$30,000,000 a year to help create a public understanding of postwar problems, such as employment, public health, housing, and conservation.

During 1945 advertising's future role was pictured as a key to full employment. After a conference with President Harry S. Truman in September 1945, Elon G. Borton, president of the Advertising Federation of America, said, "the president indicated his agreement with us that marketing, including merchandising, styling, selling and advertising, must function effectively if mass production is to produce full employment and a higher standard of living."

KERWIN H. FULTON,

President, Outdoor Advertising Incorporated.

AEGEAN, è-jé'än, ISLANDS. See DODECANESE ISLANDS.

AERODYNAMICS. See AERONAUTICS.

AERONAUTICS. Aviation continued to record immense technological progress in 1945, developing new and improved types of aircraft, creating novel and important innovations in propulsion, and surpassing all existing nonstop distance and speed records. Termination of the Second World War caused immense dislocations throughout the industry during the year, bringing quantity production of military planes to an abrupt halt, leading to the wholesale discharge of personnel; creating a tremendous surplus of aircraft on the market; and involving the industry in the formidable problems of reconversion and peacetime development. All phases of the industry were affected, including military and naval aircraft, peacetime industry, research facilities in aerodynamics and airplane development, materials, gliders, rotary wing aircraft, engines, accessories, civil and international aviation, and private flying.

Military Aviation.—On Feb. 26, 1945, Gen. Henry H. Arnold, commander of the American Air Forces, warned the country in his annual report that the United States would be the first target in the next war, and that airpower would be the weapon used. He advocated comprehensive aviation research, the maintenance of an air force second to none, a strong aviation industry, strategically located bases, co-operation between army and navy air and surface forces, a strong commercial air transport industry, preparations to administer and to counter troop carrier operations, and an up-to-date training establishment.

In the light of the year's developments, including those cited in General Arnold's report, it became clear that future aerial warfare would have to consider a number of new and revolutionary factors, among them the following:

(1) Aircraft, piloted or pilotless, moving at speeds far beyond the speed of sound—well over 700 miles an hour.

(2) Improvements in aerodynamics, propulsion, and electronic control, enabling unmanned devices to transport means of destruction to targets at distances of many thousands of miles. Pending complete development of guided missiles, vigorous continuation of the development of piloted plane construction seemed mandatory.

(3) The use of small amounts of explosive materials, as in atomic bombs, capable of causing the immediate destruction of many square miles.

(4) Perfection of defense against present-day aircraft by means of electrically controlled, target-seeking missiles.

(5) Penetration of enemy territory protected by such defenses only by aircraft or missiles moving at extreme speed.

(6) Establishment of a communication system between a control center and each individual aircraft.

(7) Location and observation of targets, operation of take-off navigation, and landing of aircraft and communications independent of visibility or weather.

(8) Ability of fully equipped airborne task forces, totally supplied by air, to strike at far distant points.

Operations of the United States air forces could no longer be considered local, or limited to any extent. Bombers larger than the Boeing B-29, one of which established a new nonstop record on Nov. 20, 1945, by flying 8,198 miles from Guam to Washington, D.C., in 35 hours and 5 minutes, can now range the world. Long-range escort fighters, at one time thought impossible, became both practical and essential to bombing operations. Radar, applied television, and other such devices rendered day and night operations practical and essential.

Naval Aviation.—At the beginning of 1945, the navy had 37,000 planes, while 29,000 more were scheduled for delivery during the next 12 months. The Naval Air Forces, with the support of over 100 aircraft carriers, were largely responsible for rolling back the Japanese from island to island in the Pacific, for destruction of the Japanese fleet, and for making possible the establishment of B-29 bases from which the Army Air Forces (AAF) were able to achieve destruction of Japan's industrial power. The navy's Seabees showed miracles of ingenuity and energy in constructing airstrips and airfields in jungle and rocky territory. It was also demonstrated how well the naval air arm could co-operate with surface vessels, particularly aircraft carriers, in creating task forces of unexampled strength and mobility. The navy also proved that carrier-based aircraft could fight land-based aircraft on more than equal terms, though of course a country more highly developed than Japan might not have allowed the establishment of any such equality. Long-range patrol bombers developed by the navy covered the Pacific far and wide; and blimps, operated mainly by navy personnel, showed that these small lighter-than-air craft remained a powerful weapon of offense against submarines.

Reports and statements issued by high ranking officers rightly emphasized the magnificent record made by the Naval Air Forces during the year, but they all seemed to underestimate one great lesson of the war: namely, that the navy, even with the aid of its airplanes, might now have to be relegated to a secondary position as a fighting force. The long-range bomber, the guided missile capable of operating at over 1,000 miles per hour, the unprecedented power of the atomic bomb, seem to have reduced the role of the navy in future wars, or even in national defense, to a purely secondary one: that of providing transportation for forces of occupation; for carrying supplies to distant bases; and for other similarly important but indisputably secondary tasks.

It should be noted that, in addition to developing its formidable fighting effectiveness, the navy encouraged and advanced technical aeronautics on a large scale and with great supervisory skill, particularly in its Bureau of Aeronautics. In developing the turbo jet, and also the rocket, as a missile and as a method of assisting take off, in providing equipment for altitude flight, in developing new and original conceptions in training devices—in all of these developments the Navy Bureau of Aeronautics equalled and in some ways surpassed the achievements of the military arm.

During the war, the navy was loath to reveal radical advances in aircraft and aircraft weapons, but this policy was not followed so rigidly during the latter part of 1945. Perhaps the navy sought to avert decreases in the funds allotted to it for research by revealing the achievements of its own laboratories and those of its contractors. At any rate, before the navy's research appropriation for 1946 was reduced from \$148,250,000 to only \$61,000,000, a number of weapons were taken off the secret list, many of them having rather queer names.

The Glomb, for example, is a pilotless glider carrying a 4,000-pound bomb. It has the appearance of a light, single-seat, low-wing plane, is towed by a fighter plane, and then released and guided to its target by television.

The Gorgon is a jet-propelled missile, carried by a bomber and guided to its target either by radio or by its own target-seeking mechanism. It carries a 100-pound bomb at 550 miles per hour.

The Gargoyle is a similar device which carries a 1,000-pound bomb at 600 miles per hour and also seeks its target automatically.

Electronic equipment made these and other new air weapons possible. The exact character of the controls was not indicated, of course, but the following remark was revealing: "airborne radars initiate defence and automatic circuitry, which can instantly release airborne counter-missiles."

Aircraft Industry.—The end of the war came sooner than the aircraft industry had anticipated; and accordingly the industry was not prepared to meet three serious problems with which it had to deal: immediate and ruthless termination of contracts; an overhanging surplus of aircraft and engines; and the problem of disposing of plants, financed in many cases with federal funds and, in extent, far greater than could possibly be utilized in postwar times.

War requirements had changed constantly; and, as a result, contracts had had to be terminated even while production requirements had gone up. For several years the primary function of contract settlements was to clear the way for further production. Such settlements were welcomed by contractors who had frequently terminated contracts without insisting on the costs or profits to which they were entitled. The Contract Settlement Act of 1944 became effective July 21, 1944, and the undelivered value of outstanding contracts at the end of the war was estimated at about \$50,000,000,000, of which amount a substantial proportion represented aircraft contracts. V-E Day had no great effect on the contracts then in existence, since the collapse of Germany had been fully anticipated, and contracts had been changed to cover requirements of the war against Japan. V-J Day, on the other hand, brought an immediate cancellation of contracts not only with the prime contractors (that

is, contractors dealing directly with the services), but also with subcontractors. Many a factory found all of its contracts cancelled overnight, and its entire plant reduced to a standstill. While companies which had come into being because of war conditions were in many cases content to disappear, companies of prewar origin reacted more energetically in a number of ways. For the most part, the latter retained their staffs of engineers. It was generally realized, both by federal agencies and by the aircraft industry, that in view of the increased rate of progress evident in aircraft equipment, production might well be lowered, but that research and development should continue as energetically as ever. Hence the need for engineers.

The question of aircraft surplus became as serious for the industry as the question of contract termination. Aircraft surplus of little value included war-weary combat planes and tactical aircraft which had become obsolescent or otherwise unnecessary. On the other hand, it was realized that transport airplanes, suitably reconverted, might facilitate the expansion of American airlines, while reducing the number of new transports to be built. Trainers and liaison types should be readily salable, but if released unwisely, might retard the construction of more modern light planes. The whole question of surplus disposal was fraught with difficulty, and on the policies adopted by the Aviation Division of the Surplus Property Board hinged much of the immediate future of the aircraft industry.

Aerodynamics.—The arrival of jet engines pushed the speed of aircraft to a figure exceeding 600 miles an hour in 1945, and accordingly forced attention on the problem of the compressible shock which occurs at or near the speed of sound. Together with the shock wave, there may occur separation of the flow from the surface of the wing with loss of lift and increase in drag. At one time it was thought that the compressibility shock would prevent flight ever occurring at speeds exceeding 500 miles an hour or so. However, flight at much higher speeds now became possible because of (1) enormous power developed by the jet engine, even though this increase was achieved at the expense of great fuel consumption; (2) the development of laminar wings specially designed to avoid violent changes in pressure round the airfoil; and (3) the use of very thin wings, either flattish diamond or biconvex in form. Faced with the problems of supersonic flow, airplane constructors found that neither mathematical analysis nor intuitive skill would suffice. Accordingly they called to their aid the high-speed wind tunnels of Langley Field. At a conference held under the auspices of the National Advisory Committee for Aeronautics, an intensive program of six months research was set up, which promised to solve many of the problems in question. Besides the loss of lift and efficiency, another difficulty was noted during the year, a change from ordinary flow to the compressible shock flow in the region of some 400 to 550 miles an hour. Such a change, occurring suddenly and rapidly, introduces a new species of flutter or vibratory effects on the wings which sometimes proves hazardous, particularly in preventing effective control and in hindering the pulling out of a speedy dive. Together with the study of the aerodynamics of compressible flow, researches have been made into the construction of the thin, knife-like wings that are required. Smoothness of contour is absolutely imperative in such

thin wings, and there must be elimination of surface riveting, and also changes in the internal construction of the wing. Several avenues of approach to the problems involved were reported, including construction of a forged, one-piece hollow metal wing; a very thin solid metal airfoil; and a wing in which the metal skin, fitted with internal rivet plates, is wrapped over beam and ribs and secured by internal riveting.

Still on the restricted list, for the most part, was a new branch of aerodynamics developed during the Second World War: a branch which may be termed the science of internal aerodynamics. By internal aerodynamics is meant that branch of aerodynamics which is concerned with the internal ducting of the airplane for the passage of air for cooling oil coolers and supercharger intercoolers, the provision of ducts for the admission of the vast quantities of air needed for jet propulsion, and the internal cooling of the radiators of liquid-cooled engines. Together with the study of such internal flow, there has developed a greater knowledge of the axial flow compressor which is in itself an aerodynamic device. The thrust produced from the jet is a matter partly of aerodynamics and partly of thermodynamics. Thus the Second World War saw a union of aerodynamics and thermodynamics in application to aircraft. It was hoped that free dissemination of the knowledge in this field would not be delayed much longer.

Applied aerodynamics progressed in another direction: that of securing even greater lift capacity at landing. Recent designs, such as those of Douglas Aircraft Corporation, revealed to the public a full span flap. By this is meant a flap which continues almost to the tip of the wing and embraces the aileron area. By means of novel smaller auxiliary surfaces, the lift increase action can thus be extended over the entire span of the wing, while aileron action remains adequate at the slowest flying speeds.

Research Facilities.—Wind tunnels and engine test stands are by no means the only research facilities employed. Lockheed Aircraft Corporation, for example, announced in 1944 an experimental modification of the Lockheed P-38, which had been used secretly since 1943 to test the characteristics of airfoils. The different airfoils to be tested are installed in this plane as envelopes or false wings over a permanent metal structure. The P-38 has also been provided with blowers and suction slots, so that the control of the boundary layer of laminar flow wings can be investigated also.

Ground research facilities were increased during the year by the completion of two large wind tunnels, of similar construction and design: the California Institute of Technology tunnel in Pasadena, and the Curtiss-Wright Corporation's wind tunnel in Buffalo, N.Y., now taken over by Cornell University. While these tunnels added greatly to existing research facilities and enabled aerodynamics studies to be extended at more centers in attacking compressibility and high-speed problems, they did not offer anything greatly novel in conception.

Far more significant was the construction of a new supersonic wind tunnel built by the National Advisory Committee on Aeronautics (NACA) for jet propulsion research. The new NACA wind tunnel, built in Cleveland, is a unique experimental facility for investigating the operating characteristics of turbo-jet, ram-jet, and similar engines expected to propel aircraft and guided missiles at supersonic speeds. In op-

eration, turbo-jets and ram-jets must handle vast amounts of air at such high speeds as to change the character of the flow entirely. Aerodynamic research, accordingly, no longer suffices if the model of the airplane used embodies aerodynamic characteristics only. The new supersonic tunnel is capable of testing complete aircraft propulsion units under conditions simulating altitudes up to 30,000 feet, and pressure conditions up to 50,000 feet. Widely varying humidity and temperature conditions are also duplicated. The tunnel can give velocities up to 500 miles an hour. The world's largest refrigerating plant, having a capacity of 20,000,000 pounds of ice daily, can lower the temperature to -48° .

Another interesting though less ambitious piece of test equipment at the NACA laboratories in Cleveland is a huge blower capable of producing a speed of 250 miles an hour. This blower, directed on the front end of an airplane, enables engines to be tried out under severe flight conditions before take-off, and greatly decreases the hazards encountered by test pilots.

It must not be supposed, however, that the NACA has a monopoly on the development of new test equipment. Wright Field, operated by the Air Technical Service Command, has also put much new equipment into operation. For example, there is a huge rig for testing helicopter rotors by whirling them at high speeds within the shelter of carefully armored walls. Wright Aeronautical Corporation has produced the world's largest bell jar for testing ignition of the airplane engine at altitudes of five miles, conditions such as are met by the Boeing B-29. United Aircraft Corporation has also completed a wind tunnel which is said to be the most versatile in the world, one which will allow the testing of aerodynamic models at 600 miles per hour, and of 4,000-horsepower engines at 200 miles per hour.

Airplane Developments.—A highly important airplane development in 1945 was the abandonment, by the Civil Aeronautics Board, of fixed numerical stalling speed limitations. The board now required that the pilot should receive clear warning of the approach of the stall by some aerodynamic device, but recognized that the evolution of aircraft design rendered unnecessary a definite value for the stall speed or minimum flight speed. The new requirement was based on the reasoning that, while stall speed had been progressively raised from 50 to 80 miles per hour, the safety of airline operation had steadily increased. The increase in stall speed was expected to have a beneficial effect on both the performance and the load-carrying capacity of the transport airplane. The board at the same time ruled that cargo airplanes would not be placed in a different category from passenger airplanes, which was reasonable; for the safety and regularity of cargo operation should by all means be considered fully as important as passenger operation.

The most important development of the year, from the viewpoint of civil aviation, was the construction of large transports for airline use, featuring greater load-carrying capacity, much higher cruising speeds, and lower operating costs. So many aircraft of this category appeared that it is impossible to describe them all even briefly.

One outstanding and remarkable design is the Douglas DC-8. Here the designers have broken boldly with tradition. Two Allison V-1710 liquid-

cooled engines of 1,200 rated power are employed, and these are enclosed within the fuselage, so that the wings are entirely free of resistance-producing nacelles. The aerodynamic efficiency of the wings is thus enhanced. At the same time, the DC-8 embodies a radically new drive. From the two engines, 50 feet of shafting carries the power to the extreme rear end of the fuselage, where two counter-rotating propellers provide thrust. By this expedient the propulsive efficiency is said to be raised to a maximum; and if one engine fails, the airplane can continue flight on the remaining engine without the handicap of the offset engine thrust which is to be found in more conventional twin engine airplanes. Nothing could be more indicative of the progress achieved in American transports in recent years than a comparison of figures describing the new DC-8, and the older DC-3, which has been in service for so many years that it has become almost synonymous with airline operation. The DC-8 has a span of 110 feet, a wing area of 1,104 square feet, and a take-off weight of 39,500 pounds. The useful load is 15,585 pounds. The total rated power is 2,400 horsepower. The maximum cruising speed is 270 miles per hour at 10,000 feet altitude. Payload is 12,000 pounds, and direct operating cost is .695 cents per 200 pound-mile (that is, per 200 pounds carried one mile). In comparison, the DC-3 has a wing area of 987 square feet and a gross weight of 25,200 pounds. Having a rated power of 2,100 horsepower, it can offer a cruising speed of only 203 miles per hour. It carries a payload of only 5,600 pounds, at a cost of 1.3 cents per 200 pound-mile. In other words, the DC-8, with a little more engine power, contrives to increase speed about 35 per cent, more than doubles the payload, and cuts costs almost in half.

For a good many years land transport equipment in the United States has been provided almost exclusively by Douglas, Boeing, Curtiss, and Lockheed Aircraft, but with the termination of government contracts, other manufacturers energetically began entering the field. The Glenn L. Martin Company was among the latter, and its 30-passenger plane for short haul operation soon attracted considerable attention. The plane was available in either low or high wing models. In either case a tricycle type landing gear, with a castoring or steerable nose wheel, provided for convenience in loading and unloading, and kept the floor level at all times. The models were designed to operate over a 500-mile range at a cruising speed of 250 miles per hour, and had many distinctive features.

In less orthodox airplane developments, the year 1945 revealed one or two departures from tradition which deserve mention. Handley Page in England built a twin engine tailless machine for private flying, which seemed to have reached a more practical state of development than the earlier Northrop flying wing. Tailless machines had received much attention in Germany during the war. The arrival of jet propulsion increased interest in tailless aircraft everywhere, because the jet, having high velocity, must not produce chances of danger to the tail surfaces. Many suggestions accordingly appeared in the American and English technical press for the combination of the latest development in power plant, namely jet propulsion, with the latest development in airplanes, the flying wing.

A development which aroused great interest as a possible means of simplifying private flying

was the Spratt wing, which appeared in the form of a small airplane having a fuselage not unlike a well-streamlined automobile. This model was constructed by a research division of Consolidated Vultee Aircraft. The single wing was mounted over the center of gravity of the fuselage in such a manner that it could be moved about two different axes which controlled the flight path of the ship. Tilting the wing about the longitudinal axis gave the airplane directional control. Tilting the control wheel forward or backward tilted the wing down or up, controlled the angle of attack, and hence the forward flight of the airplane. The controls thus approached the simplicity and natural character of the automobile control.

Materials.—Many advances in aircraft materials were made or announced during the year. Thus under the auspices of the Air Technical Service Command, remarkable results were achieved by fabricating a plastic sandwich, the outside of which was built of glass cloth suitably impregnated. The inner portions of the core, under the Fiberglas covering, were made of light resin-impregnated synthetic materials. It was found that the glass cloth facing material, in spite of its low specific gravity, could develop a tensile strength as high as 80,000 pounds per square inch; and that the whole sandwich offered great possibilities of resistance to buckling. Used as a lightweight fuselage skin, it gave most satisfactory test results in a BT-15 army training plane. This plastic sandwich showed greater strength under test than those made of aluminum alloy and of wood and plywood.

Fiberglas sandwich construction was not the only branch of plastics relating to aviation in which advances were made. Responding to the needs of wartime aviation, a flexible hose was developed, capable of withstanding violent vibration and the destructive action of high octane gasoline.

Another advance in aircraft materials was the development of high strength steel alloys capable of withstanding high temperatures. Under the auspices of the National Advisory Committee for Aeronautics, the War Metallurgy Committee, and the National Research Council, manufacturers of steel alloys produced remarkable new alloys which found immediate application in the turbo-jet, in the gas turbine, and in jet-propelled missiles.

Aviation also fostered developments in many light alloys. Under the pressure of the requirements of aircraft structure, aluminum alloys made their appearance, developed partly by the Aluminum Company of America, and partly by Reynolds Metals Company. These alloys had a strength approaching 80,000 pounds per square inch. In view of the fact that aluminum has a specific weight only one third that of steel, the value to the designer of such high strength qualities will be readily appreciated. The aircraft field was not left to aluminum, however. While tremendous advances had been made in the use of aluminum, and while its working and tooling up were now so well understood that designers were reluctant to leave it for other metals, experimental construction by the Dow Chemical Company showed that magnesium, which is even lighter, had great possibilities as regards facility in construction and even better local strength against buckling, which caused designers to regard magnesium as a particularly interesting metal to use in constructing the skin of wings and fuselage.

Gliders.—While soaring competitions were necessarily curtailed by the war, the year 1945 did see the duration soaring record broken. Paul Schweizer and Frank Hurtt, both of Elmira, N.Y., remained aloft 9 hours 17 minutes in a Schweizer sail plane. The previous record was 8 hours 48 minutes.

The year saw no great revival in soaring activity, though a few isolated records were broken, but disclosures were made of new devices and methods of analyzing air currents and air conditions which made the future of soaring seem more promising than ever. Instruments, such as the angle of attack indicator and the pitot-static tube on the fuselage, were produced, the latter giving the pilot improved means of analyzing conditions around him. Means for driving the turn indicator on gliders were improved, and much analytical work was done on the theory of dynamic soaring. Brakes or spoilers to control the flight path of the glider were employed more freely, and a parachute brake was used experimentally.

Military gliding recorded two specific advances which promised to have a decided bearing on the future civil uses of the glider. One was the development of the nylon rope for towing. In towing with hemp or steel cable, shocks and surges are experienced when gusts are encountered. Nylon has so much more elasticity than steel that it takes up shocks more readily. The employment of nylon rope for the towing of gliders is one reason why nylon was so scarce during the war. Experiments were also made in applying a simple jet device, the athodyd, to the launching of gliders. Since the launching and towing of gliders is a matter of some difficulty, a small practicable device for launching either soaring or training gliders is highly desirable. Another device which has been made public, though only in principle and without detailed description, is an automatic pilot for glider use.

Military uses of the glider have been sufficiently described in previous editions of the *AMERICAN ANNUAL*. Such uses were merely extended in scope during 1945, and airborne troops more definitely established themselves as an integral element of ground forces.

Rotary Wing Aircraft.—Perhaps the outstanding development of the year in the field of the helicopter was the successful flight testing of the PV-2 helicopter, a twin rotor machine built by PV Engineering Forum. This machine appeared thoroughly suited to the needs of ferry transportation between the heart of a great city and its airport. The PV-3, a projected commercial version of the same aircraft, was to be equipped with a 450-horsepower Pratt and Whitney engine, and with a one-man crew was intended to carry 10 passengers with a payload of more than 1,800 pounds. The top speed was estimated at 125 miles an hour and the maximum vertical rate of climb at 700 feet per minute. The normal range was estimated at 250 miles. The overall length, with rotors extended, was 84 feet. The PV is rather long because the rotors are mounted in tandem. The engine, located somewhat aft of the middle of the fuselage, drives both rotors through appropriate gears. The advantage of such an arrangement seemed to be that it is possible to provide ample room for the passengers in the fuselage and to trim or balance the machine readily with and without any passenger load. The costs of operation were estimated by the constructor, Frank Piasecki, at 5.19 cents per seat-mile. Thus the cost of oper-

ation would be higher than in the case of a large bus, but the journey from the heart of New York to Idlewild Airport, Long Island, would be only 12 minutes, and would fully justify a fare higher than that of the airport limousine.

Another helicopter developed during 1945 which aroused unusual interest was the Kellett Aircraft Corporation's XR-8, a 245-horsepower machine, the rotors of which were mounted side by side and intermeshing. While details of its performance remained secret at the end of the year, the new machine was known to have passed its flight tests satisfactorily. Release of information obtained from Germany indicated that Anton Fletter had built a similar intermeshing rotor machine, though of somewhat smaller power. The Germans also laid claim to having built the world's largest helicopter, the Focke-Achgelis, equipped with a 1,000-horsepower engine. In Austria, the Doebelhof helicopter made a number of hovering flights with the rotor driven by jet reaction. The Doebelhof jet reaction drive, however, was intended only for assistance in take-off, a conventional engine and propeller providing forward flight.

A quite novel development in rotary wing aircraft was the Rotachute, developed at Wright Field. This tiny autogiro, weighing about 50 pounds, had three freely rotating blades, a fuselage, tail surfaces, and a landing gear. It was designed to support a paratrooper and his equipment to a total weight of 240 pounds. Thanks to the tail surfaces, a paratrooper using it would be able to steer his odd craft to some extent, and therein lies its superiority over the ordinary parachute, which descends at the behest of the wind currents.

The year was marked also by the inauguration of regular rescue service of the helicopter with the United States Coast Guard, the AAF, and the navy. The Coast Guard at its Floyd Bennett Station in New York City used the helicopter in rescuing men at sea, and in assisting at accidents in localities where no other vehicle could land. A remarkable technique of hoisting operations was worked out, in which a hydraulically operated hoist was used to haul ambulances or men in a harness up to the helicopter. In the South Pacific, helicopters carried spare parts from Liberty ships to airplane repair bases located in wind or jungle territory. In Burma, harassed and wounded men in the jungle received supplies and other help by helicopter. Men lost in the wilds of Labrador were rescued by helicopter. The AAF ordered Sikorsky helicopters to be put into production before they were perfected technically because army officers were convinced of their utility in a dozen practical purposes, as in reconnaissance, liaison, and supply. Finally, helicopters were landed even on the small decks of merchant vessels while the latter pitched in rough seas.

These developments led to the general conviction that in the near future helicopters would serve many industrial purposes, as in close-shot photography, surveying, mining operations, transportation of mining machinery to difficult mountain territory, in aerial inspection of power lines, and the like. It was with the conviction that the helicopter is already practicable for such industrial uses that the Bell Aircraft Corporation prepared to produce 500 of these machines in 1945. The Bell helicopter was provided with an inertia stabilizer device which was said to be highly effective, and the machine proved successful in many ways.

The future of the helicopter in transport service and in feeder lines seemed so promising that the Civil Aeronautics Board constantly received applications for the operation of helicopters in short hauls, with the Greyhound Bus and Yellow Cab Companies among the applicants. At the end of 1945, however, there was little prospect that the helicopter would soon be available to the public as a family machine or as an aerial jitney.

The ability of the helicopter to land in restricted space and to rise vertically would seem to make it the ideal vehicle for the man in the street, but in reality the helicopter is difficult to fly because, in addition to manipulating the ordinary airplane controls and the throttle, a fifth control, namely the pitch lever, has to be co-ordinated with the other controls. Again, the helicopter seems to have little static or dynamic stability, so that it has to be continually "flown" by the pilot, who accordingly receives a feeling of insecurity and fatigue. And since, in addition to the parts which are needed in the airplane, there are also needed a transmission, clutches, free-wheeling devices, and the like, it seems likely that the helicopter, for some time to come, will cost an appreciable sum, perhaps as much as \$25,000 for a four- or five-place machine.

Engines.—While the conventional reciprocating engine will remain important for a long time, and will continue to power both light planes and transports for a good many years, the main interest in powerplant development shifted in 1945 to jet propulsion and rockets.

Originally, research in rockets was undertaken by both the AAF and the Navy Bureau of Aeronautics for the purpose of assisting take-off, especially in the case of planes rising with heavy loads to make short trips, or from the decks of aircraft carriers. Rockets, by which are meant tubes containing combustible compositions generating gas, the escape of which, in a jet, propels the aircraft or missile to which they are attached, were used in many ways. In the last few months of the war, jet or rocket propulsion was used in winged missiles having extended range (as in the case of German V-bombs); in guided anti-aircraft missiles; in launching supersonic, long-range pilotless or manned aircraft; and in aircraft having high landing speeds, which used rocket propulsion as a deceleration device.

In the field of rocket or jet propulsion, which in 1945 was apparently in its infancy even though it had made astounding advances, General Arnold suggested the following classification and curious terminology.

(1) Motor jet or reciprocating engine plus ducted fan. By this, presumably, is meant a reciprocating engine driving a compressor, the latter supplying air to a combustion chamber, with the products of combustion issuing as a jet. Such a term could also cover the ordinary reciprocating engine driving a propeller and a supercharger, with the products of combustion leading through a duct to issue as a thrust-producing jet.

(2) Turbo-prop—a gas turbine plus propeller. The presumption is that this means, a gas turbine driving an ordinary propeller.

(3) Turbo-fan—a gas turbine plus ducted fan.

(4) Turbo-jet—a gas turbine plus jet. This is a type of engine in which a gas turbine drives an air compressor, which supplies air to a com-

bustion chamber. The products of combustion then issue as a thrust-producing jet.

(5) Ram-jet—a continuous jet with compression by aerodynamic ram. This is the simplest type of jet propulsion engine. The engine, in the form of a carefully shaped venturi, receives air, which by virtue of its great speed receives a certain amount of compression. The fuel is injected into this slightly compressed air, and the products of combustion issue as a jet. The athodyd, as the ram-jet is otherwise known, has great simplicity but also low efficiency.

(6) Pulso-jet, or intermittent jet. This is the class to which the engines of the German V-bombs undoubtedly belonged. Admission of air under the pressure of forward flight occurs only when the products of combustion have left the firing chamber and produced their thrust. Combustion and increase of pressure occur only when the air admission valve or port is closed. Such an engine functions more promisingly than the continuous jet, except at the highest conceivable speeds.

In the jet engine field, developments came so rapidly that in 1945 confusion existed not only in the minds of the public but also amongst those technicians who were not themselves specialists in the field. The turbo-jet, gaining constantly in power, received one major improvement during the year: the substitution of the axial flow compressor, built by Westinghouse, for the centrifugal compressor previously employed. The axial flow compressor permitted the power egg to be of smaller diameter, and accordingly decreased the aerodynamic loss. The power of jet engines in various forms constantly increased and authorities predicted the production of 10,000 horsepower in a single unit and the application of the turbo-jet to commercial aircraft. Papers delivered before the American Society of Mechanical Engineers and the Society of Automotive Engineers defined more clearly the functions of the various types of jet systems. For conventional airplanes of low or medium speed and power, it was generally agreed that the conventional reciprocating engine would remain as the mainstay of practical aviation for many years to come. For planes of considerably higher speed, it seemed likely that there would be employed turbines with geared-down propellers, while the exhaust gases would be led into a duct and exit from a nozzle. The Republic Aviation Corporation's four-engined Rainbow which developed 400 miles an hour, employed an ordinary reciprocating engine but utilized the exhaust gases to such advantage that an extra 200 horsepower for each engine was thereby secured. The Republic Rainbow was purchased by Pan American Airways for transoceanic operation. Another possible combination which appealed to constructors was the use of a gas turbine driving a geared propeller, an giving a variable proportion of its power to a compressor supplying air to a combustion chamber with a jet-producing additional thrust. Such an arrangement would allow the major part of the power to be given to the propeller at take-off and climb, the major part of the power to be diverted to the jet at high speeds, when the jet becomes truly efficient. Finally, for very high speed aircraft, the turbo-jet with axial flow compressor would, it was thought, become the best source of power.

The turbo-jet did not cease to secure fresh victories in 1945. Bell Aircraft built and flew a turbo-jet airplane which surpassed the Air-

comet in every way. The Lockheed Shooting Star, or P-80, heavily armed and affording splendid vision, was said to be able to attack the enemy at 550 miles an hour. The British Meteor, equipped with two turbo-jet engines, established a world's record of 606 miles an hour. Ryan Aeronautical Corporation brought out, under the auspices of the navy, a remarkable jet fighter presenting an engine combination differing from those thus far described. The Ryan Fireball, which did not see combat but gave a convincing demonstration of its power in test flights at Washington, D.C., had a Wright Cyclone engine in the front driving a conventional propeller, and a General Electric jet-propulsion engine in the rear. Thereby great climb and splendid take-off were combined with a tremendous burst of speed at altitude and in level flight. Great firepower and generally conventional appearance characterized the Ryan Fireball. It was only the nozzle at the extreme rear end of the fuselage which distinguished it from the ordinary, conventional, low-wing, single-seater fighter. Four .50-caliber machine guns and two 1,000-pound bombs could be carried under the wings. Steel armor plate and laminated bullet-resistant glass in the windshield front panel protected the pilot.

Accessories and Equipment.—Little by little the AAF and the Naval Air Services released information on a variety of devices of high utility and obvious application to civil aviation. The number of such devices was so great that only the most important of them can be mentioned here, and those but briefly.

The automatic pilot for aircraft was not new, since its inception went back prior to the First World War; and the gyro, which maintains its fixed equilibrium in spite of all the maneuvers that the plane can perform, was always its primary unit. But the electronic autopilot now displaces the automatic pilot, in which the signals of the gyro were transmitted to the control surfaces by hydraulic means. In the electronic autopilot, the relative displacements, or the rate of displacements between the plane and the pilot, were picked up electronically and then amplified into a force strong enough to actuate the controls. It was claimed for the electronic pilot that it was faster and more precise in action, less vulnerable to gunfire, immune to weather effects, and more precise in bombing.

Another device of electronic character which passed off the secret list during the year was the so-called formation stick. In precise formation, flying the ordinary control stick or control wheel had always imposed fatiguing loads on the pilot, particularly in gusty weather. Control was regulated by a formation stick, a pistol-gripped lever about 10 inches long, free to move in all directions, much like the joy stick of a pursuit plane. Through amplifications of the electric variations introduced by the action of the stick, and with the aid of the servo motors of the control surfaces, the stick moved the airplane in the direction of its displacement. A stabilizing mechanism was added to give the pilot "feel."

Another electronic device, first developed for military purposes, and now presumably released for the benefit of commercial aviation, was an electronic cabin temperature control. The primary unit in this case was a small coil of wire installed in the air duct bringing air into the cabin. Temperature fluctuations of the air changed the electric resistance of the wire, and

these changes, suitably amplified by electrical means, opened or closed a damper, proportioning the amount of outside air with the heated air from the plane's heating system. The Minneapolis-Honeywell cabin control maintained the cabin temperature at 70 degrees in spite of extreme atmospheric fluctuations.

Still another example of electronic control was disclosed in the form of a supercharger regulator, in which the exhaust gases of the engine drove the turbine, which itself rotated the supercharger. The speed of the supercharger increased with altitude, and a pressure unit at the carburetor opened or closed a waste gate.

In fighting ice formation, an electronic device measured the thickness of the ice forming on the leading edge of the wing and enabled the pilot to vary the frequency of the pulsations of pressure and suction which operated the de-icing boots used to fight the ice formation.

The year saw restrictions lifted on a number of safety devices which fully proved their worth during the war and found immediate application in civil aviation. The anticollision system was devised, based on a combination of radar and electronic principles, which undoubtedly would have prevented the terrible accident in which an army bomber struck the Empire State Building in New York City on July 28, 1945. A variety of applications of radar and television were described publicly, in principle if not in great detail, which promised to do much toward permitting safe landings and take-off in conditions of poor visibility. Fog remained a cause of irregularity, but both the navy and the British developed fog dissipation methods which gave hope of making flying very much safer and more reliable in foggy weather. British agencies revealed the almost fantastic story of "Operation Fido." Fido stood for Fog Investigation Dispersal Operation. Since first brought into use, Fido aided more than 2,500 Allied aircraft having a combined crew total of 10,000 men, to land safely in dense fog. The latter danger proved more menacing than German flak; and Fido gave the necessary safety. It was discovered that if the heat of the atmosphere could be raised 7° F. at an airport, the fog disappeared. This heat was provided by a continuous line of petroleum burners installed parallel to, and some distance from, either side of the main runway. Standard fog dispersal installations consisted of three main portions—burner lights, pumping, distributing, and storage. It was found that in normal operation, fog could be cleared in 10 minutes.

Other safety devices included an electronic height indicator which was free from the variations of an ordinary altimeter under changing atmospheric conditions; harness safety belts, heated clothing, position indicators, and automatic ejectors from jet-propelled airplanes.

Civil and International Aviation.—While keen competition was expected among the airlines of various countries, particularly between those of the United States and Great Britain, international co-operation in many matters was also expected. Thus there was established, under the presidency of Dr. Edward P. Warner (who resigned from the Civil Aeronautics Board to accept this new post), the Provisional International Civil Aviation Organization (PICAO). Early in November, Greece had accepted the interim agreement, becoming the 37th member of PICAO. After weeks of laborious study by its subcommittees, the new international body was

in general agreement as regards international rules of the air, operating standards, and airworthiness standards for aircraft. It was expected that American standards, the highest in the world, would be followed. The PICAQ also endeavored to preserve vital air facilities which the Second World War brought into being. While the International Civil Aviation Organization was governmental in character, the International Air Transport Association was representative of the airlines themselves, in particular of Pan American Airways and of the British Overseas Airways Corporation. In addition to technical matters, this latter body proposed to discuss fares and other competitive matters.

One of the civil aviation developments confidently expected in 1946 was an enormous increase in the carrying of air cargo. Air transport operators were in general most hopeful of the future. In their expanded postwar fleets, 19 airlines of the United States expected to have 975 planes operating at higher speeds than formerly. This fleet was expected to include many new comforts, and to seat 36,180 passengers. To meet this huge program the airlines ordered or had an option on 407 new planes.

The growth of facilities for air cargo, however, was expected to be proportionately higher than that for carrying passengers. During 1944, the airlines carried a total of 202,879,006 pounds of mail, express, and excess baggage. With the new equipment, cargo capacity was expected to increase fivefold.

During the war years, costs for carrying passengers and freight could not be reduced because of the use of the same type of equipment, and its availability on a restricted scale. The year 1945 saw the advent of far larger and faster aircraft able to operate at much lower costs. An authoritative study by Fred B. Collins of Boeing Aircraft indicated that the large postwar transports might reduce prevailing operating costs of 17 cents per ton-mile to about 4 cents per ton-mile. At the same time there were indications that passenger costs might also drop from 2.5 cents per passenger-mile to as low as .8 cents per passenger-mile. Reduction in costs, in fact, was already being reflected by reduction in fares.

During 1945 the airlines and the Civil Aeronautics Board also considered transoceanic civil flying on a more liberal scale. Pan American Airways announced ambitious plans for cutting the time and costs of air travel to Rio de Janeiro and Buenos Aires. In view of the fact that European countries would likely establish government-owned transatlantic lines (the English government had already taken steps to nationalize all its airlines and civil air facilities in general), Pan American Airways energetically sought to have itself established as the nation's chosen instrument for the international operation of aircraft. This policy, however, was overriden; and the Civil Aeronautics Board, in a number of certificates granted during the year, established the principle that the United States international lines would be regulated, but would be allowed to remain competitive.

Another important development of the year was the announcement made by all airlines concerned with transatlantic air travel—namely Pan American Airways, Transcontinental and Western Air, and American Airlines (which was permitted to absorb American Export Airlines)—that land planes would be used instead of flying boats. At the time the announcement was

made, Pan American and American Export Airlines were still employing flying boats: the Boeing 314 and the Vought Sikorsky Flying Ace. The landplane, it was explained, was faster, more economical, and could be operated at a much lower cost than the flying boats. Moreover, when four engines are used, it was possible to fly a landplane indefinitely on any two of the four motors. The prevailing flying time from New York to London in flying boats was roughly 24 hours. It was expected that use of the new equipment, such as the interim Douglas DC-4's, the tremendously speedy Lockheed Constellation, and the six-motored Consolidated Vultee transport, would increase the number of passengers carried to a maximum of 200 per plane, and would cut the flying time to London or Paris to about 11 hours. The airlines were full of confidence and energy, and expected that the great bulk of first-class steamship travel would eventually be theirs.

The use of aviation in transmitting television and frequency modulation was one of the achievements of the year. Even before the war ended, equipment for television and FM had reached a high degree of perfection, but there remained the difficulty of broadcasting such programs on a nationwide basis. Because of the ultrahigh frequencies employed, television and FM waves travel only in straight, "line-of-sight" direction. They do not bend around the earth's surface as do the waves of standard band radio. This limited the range of stations to a maximum of 50 miles, even when the station was placed on top of the highest building. Radio-relay stations would have solved the problem except for their prohibitive cost. Westinghouse Electric Corporation engineers found a practical solution by broadcasting programs from airplanes flying six miles above the earth's surface. At this altitude, a single "stratovision" plane could cover an area of 422 miles in diameter, or 103,000 square miles: approximately the combined area of New York, New Jersey, and Pennsylvania. It was anticipated that 14 of these flying stations would be able to transmit a given program to 78 per cent of the nation's population. The airplane to carry such equipment, developed by the Glenn L. Martin Company, solved such problems as endurance, supercharging of the cabin for crew comfort, maximum reliability, and complete insulation of the transmitting equipment against noise.

Private Flying.—The war brought into being a vast number of airports. Legislation before both the House and the Senate was intended to entrust to the Civil Aeronautics Administration (CAA) the construction of a great many airports and landing fields at a cost running into several hundreds of millions of dollars. Oil companies, foreseeing the days when private flying would be of vast importance, constructed or rented small airports and equipped them with fuel, oil, and servicing stations particularly equipped to meet the needs of the private flier. Air strips or the use of roads near air service stations were suggested repeatedly. The return of hundreds of thousands of men from the AAF and the Naval Air Service guaranteed that there would be a large number of young air minded men anxious to fly. It was pointed out, however, that these would not be combat pilots. Most combat pilots declared with every evidence of sincerity that they had had enough flying, which they associated with danger, discomfort, and the death of friends. It was men from non-

combat branches, from training and maintenance staffs, who sought to fly in civil life.

The aircraft industry during the war learned a great deal about production methods, but small aircraft engines had not begun to be built on a mass scale in 1945, and their prices remained high. The cost of instruments and accessories also remained high under the influence of the wartime feeling that the government could well afford to pay high prices. Late in the year, however, the Kollsman Instrument Company announced a line of aircraft specially designed and priced to meet the needs of the private flier. Bendix Radio and one or two other radio manufacturers gave attention to the production and marketing of low priced two-way radios for the private flier, to cost no more than \$150. This development was of importance because it is only when the private flier is supported by a two-way radio that he is able to make full use of control towers, beams, broadcasting stations and other facilities. Insurance companies endeavored to lower the cost of insurance. A type of airplane, such as the well known Ercope, appeared on the market in which the rudder had disappeared, control being exercised simply through aileron and elevator. In such two-control, nonspinnable airplanes, soloing was permitted by the CAA after only five hours dual instruction. The tricycle landing gear was recognized as an element of safety and simplicity for the low-power plane, since it permitted landing in a cross wind. The specification of the Ercope was fairly typical of what the purchaser could expect in this type of craft: engine, 75 horsepower, four cylinder opposed; gross weight, 1,285 pounds; useful load, including pilot, 170 pounds; passenger, 170 pounds; fuel, 138 pounds; oil, 7 pounds; baggage, 50 pounds; total useful load, 535 pounds. Fuel mileage, 20 miles per gallon; cruising range, 500 miles; cruising speed, 110 miles per hour; maximum speed, 127 miles per hour; rate of climb at sea level, 750 feet per minute.

A new development in lighting airports was announced in November at the Idlewild Municipal Airport of New York City, where an "aisle of light," consisting of two towering walls of illumination shooting skyward flanked a broad runway 8,400 feet long. The new lighting system, developed in conjunction with Westinghouse Electric Corporation engineers, promised to help make the gigantic new landing field an all weather haven for pilots of transcontinental aircraft. See also ELECTRICAL AND ALLIED DEVELOPMENTS.

Aeronautical Consultant; Research Associate in Aeronautics, Daniel Guggenheim School of Aeronautics, New York University.

AFGHANISTAN. A kingdom of Asia, lying east of Iran and west of British India, with an area of about 250,000 square miles and a population of approximately 12,000,000, of which the majority are Sunni Moslems. Pushtu and Iranian are the dominant languages, the former being the official language. Kabul, the capital, has about 150,000 inhabitants. Other cities are Kandahar, 60,000; Herat, 50,000; and Mazar-i-Sharif, 30,000.

Government.—Afghanistan is a constitutional monarchy, Mohammed Zahir Shah (b. 1914) succeeding to the throne on Nov. 8, 1933. Complete independence of the country was recognized by Great Britain in 1921. Legislative power is vested in a parliament consisting of king, Senate, and

National Assembly; the National Assembly has 109 elected members, and the Senate is composed of members appointed by the king for life. Tribal organization continues to play a role, less and less important, under the gradually strengthened central government. A governor heads each of the five major and four minor provinces into which the country is divided. Afghan budgets are not published, and consequently no accurate information is available concerning the revenue of the country. It is believed, however, to be derived chiefly from customs duties, land taxation, and the earnings of government monopolies, principally the karakul monopoly. The laws are based on the Hanifi code of the Shariat (Moslem religious law), which derives from the Koran, the deeds and sayings of Mahomet and his disciples. There is a system of three regular courts and an Arbitration Court. Afghanistan exchanges diplomats and has commercial agreements with other countries. The first United States minister to Afghanistan presented his credentials to the Kabul government in July 1942, and the first Afghan minister to the United States arrived in Washington in May 1943. Although, as a result of pressure from the United Nations, most unofficial Axis agents were expelled from the country after outbreak of war, the Japanese continued to maintain large diplomatic and consular staffs in Afghanistan.

Education and Public Health.—There are free elementary schools throughout the country. Secondary schools (also free) were reported in 1945 as limited to Kabul and the provincial capitals. Primary schools were being established in almost all villages in most of the provinces. Kabul, besides its secondary schools, has two training schools for teachers and three military schools. Kabul University, established in 1932, has faculties of medicine, chemistry and law. The country also has some technical, art and commercial schools.

The government is engaged in a program for the promotion of public health, including training of doctors and nurses in government institutions, free examination, treatment, and medicines in government hospitals and traveling clinics. Special attention is given to public health work in schools and industrial establishments.

Production.—Despite the fact that it is essentially an agricultural country, as a result of its mountainous and desert terrain, and lack of water, only about one fifth of the area of Afghanistan is under cultivation. Rainfall is slight, and dams are being built to harness mountain streams in the interest of irrigation as well as for providing power. The most important crops are cotton, fruits, grains, opium, pulse, and tobacco. Grapes and melons are important articles of diet, and a leading export commodity, particularly to India. Medicinal and industrial plants found in commercial quantities include asafetida (asafoetida), castor oil plants, cumin, gum tragacanth, manna, and madder. Livestock, notably sheep, are a main source of wealth. The native fat-tailed sheep furnish mutton, grease which is used as butter, and wool which is used locally to make "Afghan carpets" or is exported as carpet wool. Afghanistan's principal export commodity is "Persian lamb," the skins of still-born or baby lambs of the karakul sheep.

Native industry is of the handicraft type, small plants producing cotton, silk, and woolen cloth, shawls, sheepskin coats, carpets and rugs, copper vessels, iron work, and gold and silver ornaments. The government controls or owns all

mechanized industry under a system of monopolies, these including such activities as sugar and cotton manufacturing, the generation of electricity, and stone-cutting; some companies dealing in miscellaneous goods also enjoy monopolies in certain areas.

Minerals occur in wide variety, including coal, iron, copper, lead, gold and silver, asbestos, mica, sulphur, fine lapis lazuli and other precious stones, and petroleum; but actual surveys, although incomplete, have failed to bear out the assumption that these minerals are in great abundance. An American oil concession was recently given up before production began. Facilities for production of electric power have been developed to a limited extent, but many sites as yet remained unutilized.

External Trade.—One fifth of the commerce is with the Soviet Union, generally a direct exchange of goods between the two countries, and the remainder moves to and from India, much of it "in-transit" trade with third countries. The principal exports are karakul skins, fresh and dried fruits, nuts, vegetables, and raw cotton, and those of lesser importance include asafetida, carpets, live animals, and wool. Exports of karakul skins from Afghanistan to the United States through the port of Karachi, India, in 1940 were valued at Afghan Rs. 374,391,600; and exports of carpet wool to the United States had a value of Afghan Rs. 14,638,320. Some three quarters of the imports consist of automotive equipment, cotton textiles, gasoline and kerosine, machinery and millwork, sugar, and tea. Besides automotive products, imports from the United States include pharmaceutical products, photographic supplies, radios, and sewing machines.

Currency and Banking.—The official currency unit is the afghani, containing 10 grams of silver, 900 fine, and divided into 100 puls. In 1945, 13 to 13½ afghanis were approximately equivalent in exchange value to the United States dollar. Paper notes in denominations of 5, 10, 20, 50, and 100 afghanis are issued through the Bank of Afghanistan, which also handles all foreign currency accounts, foreign exchange transactions, and all bank accounts of government institutions. The Afghan National Bank, a joint-stock banking company established in 1933, confines itself to commercial banking, maintenance of savings accounts, safe deposit services, commercial and personal loans, buying and selling of shares in Afghan commercial enterprises, and the financing and handling of foreign-trade transactions for Afghan exporters; the bank has branches in the United States and in various European countries.

Communications.—There are no railroads in Afghanistan. The Indian railroad system extends through Quetta as far as New Chaman, on the frontier; and Kushk, across the northern border, is the terminus of a railroad of the Soviet Union. A chain of motor roads extends around the country; while the condition is not good, most roads are passable in good weather, and some in all weather. Despite vast improvements, most of the routes of traffic in Afghanistan are still caravan trails. Scheduled air transport lines serve Kabul, which also has wireless communications with other parts of the world.

AFRICA. Second in size of the six continents, lies in the eastern hemisphere. Including adjacent islands, the area is about 11,700,000 square miles, and the population is estimated to number approximately 158,000,000. Within Africa are the kingdom of Egypt, the native empire of

Ethiopia, the republic of Liberia, and the autonomous Union of South Africa. The greater part of the continent, however, is under French, British, Portuguese, or Spanish administration, Italy having lost her territories during the war; France administers the largest, though not the most fertile, area. See articles on the several countries and divisions of Africa.

AGRICULTURAL ADJUSTMENT AGENCY (AAA). (Now the FIELD SERVICE BRANCH.) Established in 1933, the AAA was one of the agencies of the Department of Agriculture grouped into the War Food Administration which carried out the wartime food program. Under the Department of Agriculture reorganization Aug. 20, 1945, AAA became the Field Service Branch of the Production and Marketing Administration. Objectives of the agency are: (1) to restore and maintain all soil resources on farms; (2) to guide farmers in producing agricultural commodities in the amounts needed; (3) to stabilize farm prices and income.

Administration.—The AAA program is administered nationally by the Field Service Branch in Washington, by AAA state committees appointed by the Secretary of Agriculture, and by AAA county and community committeemen elected by neighboring farmers who, by co-operating in the program, automatically become members of county conservation associations. Almost 4 million agricultural producers, operating 73 per cent of the United States cropland, in the more than 3,000 agricultural counties, took part in the 1944 program.

AAA committees also handle the local administration of commodity loan programs (made available through the Commodity Credit Corporation), and special programs of production payments to dairy farmers, beef cattle, and sheep and lamb producers. During the war years, they brought the War Food Administration and other federal agencies into touch with farmers for such war programs as rationing of farm machinery and supplies, facilitating the transportation and distribution of feedstuffs, certifying producers to get materials for essential farm construction, and making recommendations to other local boards on farmers' needs for tires, off-highway gasoline, and tractor fuel.

Goals.—During the war, the "production goal" idea, formerly used by AAA for major crops, was applied to all crops and livestock. Now being used as a convenient means of converting agriculture to peace, the goals help farmers to plan their individual production in line with national requirements. The Department of Agriculture determines the estimated requirements for individual farm commodities and presents them to state goal committees. Acting on this information, state groups set crop and livestock goals, the totals of which become the national goals. Some state goals are later broken down into county goals. AAA committeemen help individual farmers plan their production in line with the goals. The goals for 1945 called for planting almost 364 million acres, about 9 million more than were planted in 1944.

Conservation.—While the AAA conservation program for 1945 emphasized practices which would increase farm production quickly, attention was also given the larger and permanent conservation measures. Farmers could earn program payments, either in cash or in the form of conservation materials or services, for those practices which would increase yields or maintain future soil fertility.

Approved practices varied by states and counties according to local conditions, but generally they were those which would (1) increase yields of products required in the war program; (2) conserve and improve soil fertility; (3) promote conservation and better use of water; (4) conserve and increase range and pasture forage; and (5) prevent wind and water erosion. Of particular importance, in view of national production needs, was a practice to encourage increased harvesting of grass and legume seed.

Under the 1944 agricultural conservation program, the following major practices were carried out: Application of nearly 2 million tons of 20 per cent superphosphate and almost 24 million tons of limestone; stripcropping on more than 6 million acres; constructing approximately 450 million linear feet of terraces; use of 23 million acres of green-manure and cover crops; harvesting over 6 million acres of legume and grass seed; renovating more than 2 million acres of perennial grasses and legumes; moving almost 127 million cubic yards of dirt in constructing dams and reservoirs. The 1944 program was carried out on nearly 3½ million farms, and conservation payments totaled nearly \$294,000,000.

Allotments.—With war requirements outstripping potential production, acreage allotments, an AAA tool which farmers formerly had used to adjust crop production of basic crops to market demands, were used only for tobacco in 1944. Tobacco also was the only crop marketed under quotas, after their use was approved in referendum, as provided by law, by more than two thirds of the growers voting.

Production Payments.—To increase milk, and later, meat production, special payments were made to producers of these commodities. For the fiscal year ending June 30, 1946, the allocation for dairy payments is \$568,000,000 plus a 10 per cent tolerance. The beef payments allocation was \$40,000,000 for 1945. Sheep and lamb payments were expected to amount to about \$36,000,000 in 1945.

Production.—Indications in September were that 1945 crop production would be about the same as in the two record years, 1942 and 1944. In 1944, farmers broke food production records for the eighth consecutive year. While favorable weather helped, record food production in recent years has been due in large measure to increased yields stimulated by the practice of conservation methods of farming. Yields in the war years, 1941–44, were one fourth greater than average yields for the predrought period, 1923–32. Total farm output in 1944 was above the highest reached during any year of the First World War.

Loans.—Crop loans, administered locally by AAA committees, were made in 1945 on corn, wheat, cotton, rice, tobacco, soybeans, flaxseed, dry beans and peas, potatoes, sweet potatoes, barley, grain sorghums, rye, hay, and pasture seeds, and naval stores.

Crop Insurance.—Authorized by Congress late in 1944, federal crop insurance for wheat, cotton, flax and "trial" crops (corn and tobacco in 1945) is being made available to farmers through AAA committeemen.

AGRICULTURAL ENGINEERING. See AGRICULTURAL RESEARCH—Bureau of Plant Industry, Soils and Agricultural Engineering.

AGRICULTURAL RESEARCH ADMINISTRATION.

Established as a major unit of the United States Department of Agriculture in December 1941, the Agricultural Research Administration supervises and directs most of the department's scientific research work. It determines research objectives and co-ordinates the various projects undertaken. It comprises 7 bureaus and agencies engaged in research and regulatory work, 4 regional research laboratories, and 9 Bankhead-Jones laboratories, so named from the Congressional legislation which created them to deal with special agricultural problems. The Research Administrator, P. V. Cardon, also acts as liaison officer on research activities co-operative with other public and private agencies.

Through its various scientific findings the Agricultural Research Administration aids farmers, professional and industrial groups, and the public generally in improving methods, reducing losses, developing new products, and otherwise increasing individual welfare and the nation's resources.

The units of the research administration include: Bureau of Agricultural and Industrial Chemistry; Bureau of Animal Industry; Bureau of Dairy Industry; Bureau of Entomology and Plant Quarantine; Bureau of Human Nutrition and Home Economics; Bureau of Plant Industry, Soils, and Agricultural Engineering; and the Office of Experiment Stations. The agencies named have immediate direction of the work conducted at the regional and other research laboratories and at the department's Agricultural Research Center, Beltsville, Md., about 13 miles from Washington, D.C.

Brief accounts of the work at each unit, including noteworthy results of 1945, follow:

Bureau of Agricultural and Industrial Chemistry.—

The Bureau of Agricultural and Industrial Chemistry, under the direction of its chief, O. E. May, conducts research on the industrial utilization of agricultural commodities, and on the commercial processing of food and feed raw materials. It operates the four regional research laboratories authorized by Congress in 1938 to search for new and wider industrial outlets for farm crops and separate research divisions on naval stores, allergens, enzymes, microbiology, liquid motor fuels, and agricultural chemical investigations. All of its investigations, except those on allergens and biochemistry, which are carried on in Washington, are quartered in the regional laboratory buildings, or the bureau's more than a dozen field stations located in various parts of the country.

During the war the bureau had more than 1,000 persons at work in its various laboratories on projects dealing with the use of agricultural commodities in the war effort. The program included work on soft-grit blasting materials, liquid motor fuel, penicillin, rot-resistant fabrics, vegetable waste leaf meal, peanut glue, smokeless powder, and more than 100 other projects.

One of the latest agricultural developments to come out of wartime research is the use of ground crop wastes in the new air-blasting method for cleaning carbon deposits from cylinders and pistons of aircraft engines. "Soft grit" made from finely ground corn cobs or similar farm waste is the material used for this purpose. The method for using waste material for removing carbon was worked out by scientists of the bureau's Northern Regional Research Laboratory, at Peoria, Ill., in

close co-operation with the Assembly and Repair Department of the Naval Air Station at Norfolk, Va. Considerable man hours can be saved by using this method which makes it possible to clean from 4 to 10 times as many parts in a day as by the old method of scraping by hand, turning on lathes, and sandblasting which frequently damaged the parts. Good results are obtained by using a mixture of 60 per cent of corncob grits and 40 per cent of rice hulls. These materials have been adopted by the navy, which is taking the entire output of one factory that is making the grit according to the desired specifications.

As a result of research by bureau scientists a process for the chemical conversion of such agricultural residues as corncobs, sugarcane bagasse, peanut shells, flax shives, oat hulls, and cottonseed hulls and burs into liquid motor fuel is now moving into large pilot-plant production. Experimental tests indicate that from 90 to 95 gallons of liquid motor fuel can be obtained from a ton of corncobs or cottonseed hulls, and that something like half of this is in the form of ethyl alcohol. A continuous process for the treatment of corncobs and cottonseed hulls has been worked out, and a suitable building where the method can be tried out on a semi-commercial scale is being constructed on the grounds of the Northern Regional Research Laboratory. Corncobs will be the first of the so-called waste materials to be tried on a large scale in the new plant. Investigations on other residues will be begun later as the work progresses. It has been estimated that something like 200 million tons of farm wastes are produced each year. A considerable amount of this is plowed back into the soil to help maintain fertility and prevent erosion, but after this is done there is still around 100 million tons left that might be available for making motor fuel under this new process. The establishment of an industry that would utilize even a part of this large amount of waste material should help the producers of these residues. That is the object of the research.

Penicillin was still in the laboratory stage in the summer of 1941 when the problem of increasing production was presented to bureau scientists. The Bureau of Agricultural and Industrial Chemistry was selected to work on this problem because some of its scientists have had years of experience in the use of molds in the fermentation field, and because it has in one of its four regional laboratories one of the largest collections of molds in the world. By selecting better strains of molds and feeding them on a new diet composed largely of corn steeping liquor and milk sugar, the investigators were able to quickly increase the yield of penicillin more than 100 times. This permitted the immediate production of penicillin on a commercial scale which rose from nothing in 1941 to 21 billion Oxford units in 1943, and to 3.035 billion units during the first 6 months of 1945. Increasing the production soon affected the price of penicillin. In 1943 the price was \$20 per 100,000 units, the amount required to treat serious types of infection. It has been dropping steadily ever since. This research not only made an important life-saving drug available to the armed forces and civilians much sooner than otherwise would have been possible, but it doubled the outlet for a by-product of the farm.

A new modified cotton fabric that will not mildew or rot is the result of wartime research in the Southern Regional Research Laboratory, at

New Orleans, La. This new material has the strength and appearance of ordinary cotton plus the ability to withstand the attacks of rot-producing micro-organisms. As a test of the rot-resistance of this new material some of the treated cloth and thread were buried in the ground or in especially prepared soil beds teeming with the kind of micro-organisms that would cause ordinary cotton to rot within a week. These tests showed that the treated cloth could remain buried under such conditions from 6 months to a year with very little loss of strength. Sandbags made from the treated cloth, sewed with treated thread and piled outdoors on the ground, were intact after 2 years of exposure to the weather in the New Orleans climate. The preservative used in this method does not cause discoloration of the fabric. It does not produce an odor, or stickiness, and does not make the fabric toxic, a great advantage when the treated cloth is used for food sacks.

This new development gives promise of being useful in two separate fields, each of which consumes considerable quantities of cotton. It is promising for making rot-resistant bags for the packaging of fruits, vegetables, and other food products. The treated cotton cloth, yarn, and sewing thread promise to be suitable for making clothing that will not mildew, tents and awnings that will not rot in damp climates, and fish nets that will not rot if put away wet.

Broilers fed on broccoli-leaf meal produce fine-flavored meat, according to the results of co-operative research between the bureau's Eastern Regional Research Laboratory, near Philadelphia, Pa., and the Delaware Agricultural Experiment Station. Chicks fed a standard mash to which had been added 8 per cent of dried broccoli-leaf meal not only grew well, but the meat had a highly pleasing flavor. Chicks fed on this mixture were compared to similar chicks fed on alfalfa-leaf meal. The chicks that received the broccoli meal made faster growth. Carrot, lima bean and turnip meals were about equal to alfalfa, and pea vine a little lower.

This development is the outgrowth of an attempt by agricultural scientists to find uses for at least a part of the large tonnage of waste leaves that occur in the production and processing of common vegetable crops. Research showed that the blade portions of the leaves, free of stems, are high in protein, containing from 30 to 36 per cent in some cases. This material is also high in carotene, or pro-vitamin A, and in riboflavin, both of which are needed in poultry feed. Research is now in the pilot-plant stage and detailed information in mimeograph form is available to those who wish to set up a plant to make meal by this new process.

A new peanut glue that has the sticky qualities of flypaper, when wet but that is dry to the touch before moistening is the outgrowth of investigations by agricultural chemists. The light color which does not materially affect the color of the surface to which it is applied makes this glue especially desirable for certain work such as binding books and making gift boxes. It can also be used in bonding plywood, and for that purpose is about as satisfactory as casein glue which is made from skim milk, but peanut glue can be made considerably cheaper than casein glue. This is a possible industrial outlet for a part of the peanut crop which was greatly expanded during the war for food purposes.

Dehydrated vegetables take about one-third the space required by similar products processed

in other forms. Bureau scientists who were working on this project in 1941 conducted much of the basic research which made a rapid expansion of the dehydration industry possible. It was expanded from approximately 20 establishments with a producing capacity of some 15,000,000 pounds a year in 1942 to several hundred establishments with an annual capacity of about 500,000,000 pounds in 1943. The figures were even higher for 1944. One-third of the bureau's Western Regional Research Laboratory, at Albany, Calif., was devoted to dehydration work. One of the latest developments in the dehydration field is the addition of a desiccant to packages of dehydrated vegetables. This absorbs the moisture in the can and makes the vegetables keep longer.

Bureau of Plant Industry, Soils, and Agricultural Engineering.—In his annual report for the fiscal year 1945, Robert M. Salter, chief of this bureau, cited accomplishments covering a wide field of activities. Much of the work of the bureau's scientists, often in association with state experiment stations and other investigators, dealt with means of reducing costs of crop production through better varieties, improved fertilizers, and new methods and machines more closely adapted to crops and conditions. These and various other developments provide the nation with greater assurance of sufficient food, feed, vegetable oils and fibers, and tend to improve crop- and soil-management systems so as to sustain profitable production more readily without undue loss of basic resources.

An outstanding development during the year was progress in uncovering a variety of agricultural uses for the chemical 2,4-D (2,4-Dichlorophenoxyacetic acid). It has been developed widely as a weed killer and is now commonly sold for this purpose, but the newer researches indicate it has value in shortening the ripening period of some fruits, such as bananas after harvesting, and in bringing about changes in the composition of various crops such as in their sugar and amino acid contents. Research on this and related chemicals is continuing.

The bureau also announced more than 2 dozen new varieties of crop plants, bringing to more than 100 the number brought out in the last four years. Although the gain to the country from these new varieties cannot be closely measured, the new wheats created in recent years, largely by state and federal plant breeders, are estimated to have been responsible for about 100,000,000 bushels of the 1944 crop of hard red spring wheat. The bureau made a similar estimate on rice, showing that 5 improved varieties of rice, grown on 48 per cent of the southern rice acreage in 1944, gave yields 13 per cent higher than the standard varieties and put an additional \$10,500,000 in the pockets of the growers.

Speeding up increases in seed supplies has given farmers the advantage of research results quickly. On occasion it has been possible to compress this stage into an astonishingly short space of time; 25 pounds (less than a bushel) of seed of a new oat variety, Clinton, harvested at Ames, Ia., by state and federal agronomists in August 1943, and sown 3 months later on irrigated land at Mesa, Ariz., produced 65 bushels (more than 2,000 pounds) the following April. The 65 bushels were sown on irrigated land at Aberdeen, Idaho, May 20 and 1,200 bushels harvested in August, 1944. Selected farmers in Iowa, Illinois, and Indiana who planted the new variety in the spring of 1945 harvested 40,000

bushels or more that became available for commercial planting in 1946.

For the benefit of tobacco farmers in the Coastal Plain area of the Southeast, the bureau rushed through a publication showing a new practice for the control of both weeds and soil-borne diseases in tobacco plant beds. State and federal investigators had concluded in tests finished earlier in the season that applying a pound of urea and half a pound of calcium cyanamide per square yard of plant bed the previous fall makes possible a good stand of strong tobacco plants and greatly reduces the stand of weeds. As a result of early publication it was possible for tobacco farmers in Virginia, North Carolina, Georgia, and Florida to use the new method in the fall of 1945.

In order to cover a large variety of research results obtained by this bureau, and in many cases co-operating state experiment stations during the fiscal year 1945, items concerning them are presented concisely as follows.

Two new yellow corn hybrids, for Kansas, now becoming established and that may fit also into parts of Missouri and other states to the east; two new durum wheat varieties, Stewart and Carleton, as good as the old variety for macaroni and also highly resistant to rust; some additional new oat varieties, early, resistant to diseases, high yielding and with other good qualities; disease-resistant barleys of good yields and other special qualities for parts of the North Central States and one for irrigated land in the Intermountain region; a new sorghum (Midland) with stiff stalks that can be harvested with a combine, saving labor for the western two-thirds of Kansas; control of bindweed by growing crops less palatable to sheep than bindweed, such as Sudan grass and rye, so sheep will keep the weeds grazed close.

Abaca or Manila hemp production in Central America, started by the bureau in 1925, by 1945 had reached a monthly total of 2,000,000 pounds. One-variety cotton production has now been established in 2,194 communities of 581 of the 775 cotton-producing counties, giving the farmers \$8 more an acre, or a total gain of \$56,000,000 a year. Still other recent results are: new facts on what makes strength in cotton fibers of different lengths and fineness; improvement in castor bean plants through genetic studies, making them yield better; demonstration of better basis for selection and pricing of hops as a result of the discovery of the relation of resin content to seed content, low seed content meaning more alpha resin.

Over a period of nearly 40 years the investigators have developed a farming system for the western part of the Central Plains consisting basically of a flexible 4-year rotation as follows: (1) fallow; (2) winter wheat on fallow; (3) grain sorghums and beans in alternate strips on winter wheat stubble land; and (4) forage sorghums, grain sorghums, or possibly proso on the sorghum land and oats and barley on the bean land. Other studies have shown that crop residues left on the surface in the dry-land areas have no important effect on yield but are of value in erosion control. Still other developments are new facts on the effects of age on growth and survival of shelterbelt trees of many varieties.

Ways were found of reducing heavy spoilage of binned grain by preventing moisture from entering the joint between sidewalls and floors and through floors. Good practices were developed for handling and storing immature or soft corn.

The investigators discovered that in apple storages there is an advantage in reversing airflow every few hours to avoid overchilling and overheating near inlets and outlets.

Scientific studies also led to new facts on different types of sprayers and dusters and on airplane dusting in the control of borers in sweet corn. A field tung-nut huller promises a great saving in storage, bags, and transportation over the method of having the hulling done at the mill. A new sweetpotato vine remover facilitates harvesting and the use of the vines as feed. A continuous-type sugarcane loader saves labor, and a stubble shaver and crusher destroys the borer, a pest of the crop.

A new machine for flax scratching can extract almost twice as much of the fiber as obtained by present methods and the quality is better. Cotton gin chokages that have caused damage to lint in the dry Southwest have been shown to result from static electricity and can be controlled by introducing a fine mist of water and sulphonated oil into the gin.

New alfalfa hybrids giving a high yield of seed, and different procedures and practices, such as watering and varying closeness of plants have been shown to make wide differences in yields of this crop. Still other recent developments are: a new hard-seeded crimson clover that volunteers readily and does well over a wide area of the Southeast; reports on a gradual increase in soybean diseases; new vetches taking the place of common vetch as cover crops for the South and to make more certain good yields of seed and hay in the Pacific Northwest; a simple chemical dip treatment (sodium pentachlorophenate in water) to control surface molding of wooden containers, and discovery of a new pine tree canker in western North Carolina.

The bureau's work has led also to: two new varieties of peaches; improvements in the spraying of apples and pears to control preharvest drop, especially the use of 2,4-Dichlorophenoxyacetic acid, which has a longer effect than the material previously used; control of cranberry fruit rots with an organic fungicide that leaves no objectionable residue; new cultural practices that bring better pecan yields; better yields of tung oil through proper application of nitrogen fertilizer even where legume cover crops are used; use of the aerosol or "bomb" technique in applying colchicine to induce genetic changes in plants; announcement of a new heat-resistant leaf lettuce, Slobolt, seed of which has already been increased by commercial growers; and new mildew-resistant cantaloups for the Southwest where powdery mildew almost destroyed the cantaloup industry in California's Imperial Valley.

Further advances have been: the creation of a new green-type perennial onion, the "Beltsville," that does not ripen down; progress in tomato hybrid breeding that gives promise of garden and commercial varieties resistant to fungus diseases of the leaves that reduce yield and quality of fruit; sulphur dusting of field beans to control rust and greatly increase yields; better seed and close planting to increase peanut yields; use of the spectrograph in problems of crop production, especially plant nutrition; new potato varieties for the South as a result of a National Potato Breeding Program; benefits from irrigation of potatoes in the East; successful production of American Easter lily bulbs through control of virus disease that ended the industry in Bermuda and had begun to attack the fields in Japan; a mica product, sometimes used as poultry litter,

found to give florists good results, instead of soil in growing seedlings as it helps germination and reduces losses from damping-off.

A new practice in refrigerating tomato cars to around 55° F. consists in blowing bunkers full of snow ice. A study of the maintenance of phosphorus in irrigated soils showed that a 2-year rotation with large applications of manure was effective in increasing the content of soluble phosphorus. Tests of sweet clover as green manure in crop rotations in an area of Washington have shown that it reduces the yield and quality of potatoes. In the same area, rotations with 3 years of alfalfa produced high yields of corn and potatoes and greatly reduced wireworm infestation.

Nematological studies showed that the potato rot nematode is a separate species, a fact that should be helpful in control work. A nematode from a head of rye that had been in an herbarium since 1906 was revived, showing a dormancy period of 39 years, 12 years longer than a previously reported record of a wheat nematode.

A placement program for the establishment of cinchona plantings in South and Central America was completed. Living plant materials received from foreign countries during the year included beans from Chile, Colombia, Mexico and Peru; corn from the Argentine; and oat species from Uruguay.

Studies of various plants as sources of rubber have been going on. Among them have been *cryptostegia*, *kok-saghyz* and *guayule*, and the well-known native Amazon Valley tree, *hevea*. Understanding of *hevea* culture is intended to help establish in tropical America a permanent, self-sustaining, rubber-producing industry on a small-farm basis. The work has been done under co-operative agreements with 12 countries. Progress has been made in solving *hevea* disease and propagation problems. Methods of propagating *guayule*, the wild rubber plant of the Southwest and Mexico, have been improved.

Fertilizer experiments carried on with North Carolina indicate that the corn yield in that state might well be doubled in ten years. In one outstanding case, land that grew 19 bushels an acre without added nitrogen grew 107 bushels when 120 pounds of nitrogen was used to the acre. Much soil depletion was shown to be occurring in the northern Great Plains from continuous cropping and only where manure was used was there no depletion. Research made it possible for the first time to manufacture deflourinated phosphate rock commercially, a product suitable for use as fertilizer and as a supplement in feeds for livestock. A study showed that, in the United States, expenditures for fertilizer ranged from \$111,000,000 in 1911 to \$450,000,000 in 1944. Soil survey field scientists spent much of their time on war crop problems, but much work, nevertheless, was done by men in co-operating state organizations in developing vitally needed soil maps, a total of about 1,085,000 acres being covered. Publication of such reports was greatly curtailed by the war.

New methods have been devised against cane-field weeds, flaming and the use of 2,4-D being promising, as is also use of closely spaced soybeans and dense-shading types of cane. Sugar sorghums recently brought from Africa and India have broadened the prospects of breeding up better varieties of these plants. Improved disease-resistant varieties of sugar beets are now the mainstays in this branch of sugar production in

the United States. Discovery of a male-sterility factor in sugar beets opens up possibilities of using hybrid vigor in this crop comparable to its use in corn and onion production.

Research men succeeded in making an interspecies cross that promises to make the long-sought immunity of wild tobacco to "wildfire" diseases available in cultivated tobacco. They also showed that blue mold can be controlled by dusting the tobacco plant beds, a method that saves time over spraying.

Bureau of Animal Industry.—Established by act of Congress, May 29, 1884, the Bureau of Animal Industry is concerned primarily with the development of the livestock, meat, and poultry industries of the United States. The bureau's early duties and activities, as assigned by Congress, were the control and eradication of animal diseases and parasites, but later Congress added other responsibilities. In addition to protecting livestock health, the bureau now conducts investigations and experiments in the breeding, feeding, and management of domestic animals, including poultry. It also studies methods of improving the quality and usefulness of their products.

During the fiscal year ended June 30, 1945, the bureau, under the direction of its chief, A. W. Miller, continued to give principal attention to projects related to an abundant production of food in support of the war, then in progress. Bureau officials co-operated with other federal and state agencies in matters relating largely to the production and conservation of livestock and poultry products.

To these ends the bureau continued numerous projects in co-operation with official agencies, livestock producers, and industry with particular regard to measures for protecting the health of domestic animals and otherwise aiding their large-scale efficient production.

Veterinary Inspection and Research.—The federal-state campaign, begun in 1934, to suppress bovine brucellosis, or Bang's disease, made further progress during the year in response to requests by livestock owners for assistance. One phase of this work, known as the area plan, consists in testing all dairy and breeding cattle more than 6 months of age, removing the reactors, and cleaning and disinfecting the premises. As a result the Department of Agriculture had designated up to June 30, 1945 a total of 599 counties, located in 22 states, as practically free from bovine brucellosis. This number of counties represented a slight gain over the previous year when the corresponding number was 591 in the same number of states. Another phase of the work, consisting of vaccination, has been of great value in controlling the disease, especially in parts of the country where there is a great deal of brucellosis infection. Heretofore the Bureau of Animal Industry has advocated the protective vaccine for calves only. As a result, since the adoption, in 1941, of calfhooed vaccination as a part of the official plan of eradicating brucellosis, approximately 1,260,000 calves have been vaccinated under official supervision, nearly one-half of them during the last year. Recent field trials have shown that, in some types of herds and under certain conditions, vaccination of adult cattle in an infected herd tends to prevent abortion and to curb otherwise the spread of the infection. Though adult vaccination is advisable and is consequently now permitted to meet such needs, it is not recommended in herds entirely free from brucellosis, in cows 5 months or more

advanced in pregnancy, or when prohibited by state laws. At the end of June 1945, more than 17,500,000 cattle, located in about 2,300,000 herds, were under official supervision for the eradication of brucellosis.

The campaign begun in 1917 to eradicate bovine tuberculosis, through systematic tuberculin testing and the removal and slaughter of reacting animals, continued to progress. In recent years most of this work has consisted in retesting herds previously freed of the disease. Valuable aid in the project is provided by meat inspection services, both federal and state. Reports of veterinarians conducting post mortem examinations of cattle have helped in locating and removing tuberculous cattle from centers of infection that might otherwise have escaped detection.

The campaign against cattle-fever ticks was continued in co-operation with state and county officials of southern states and territorial officials of Puerto Rico. In the eradication of this pest more than 8,000,000 inspections or dippings of cattle, horses, and mules were made under official supervision. In Texas, along the international boundary in the lower Rio Grande Valley, some reinfestation occurred from stray or smuggled animals from Mexico, in spite of a federal quarantine on a narrow strip along the border and constant patrol of the area. All known infested and exposed areas, however, were soon brought under control.

In supervising the interstate transportation of livestock to prevent the spread of disease, bureau inspectors at 48 stockyards inspected more than 26,000,000 cattle, 27,000,000 sheep, and 28,000,000 swine. Of these animals about 170,000 cattle and sheep were dipped for scabies and more than 274,000 swine were immunized against hog cholera to comply with the regulations of the department and the various states to which they were destined for feeding and breeding purposes.

Veterinary inspectors at public stockyards continued to give particular attention to inspection of all ruminants and swine for foot-and-mouth disease, no case of which was found.

As another protective function, the bureau supervised the production of veterinary biological products at licensed establishments producing anti-hog-cholera serum and similar products for interstate shipment.

A field survey which the bureau conducted on the extent of the horse disease, encephalomyelitis or sleeping sickness, showed the importance of determining the type of virus that causes the infection in specific cases, so that a corresponding vaccine may be administered as a preventive. During the calendar year 1944 the disease occurred about 14 times as often in unvaccinated as in vaccinated animals. More than four-fifths of the 19,590 cases reported during 1944 occurred during the months of August, September, and October. This seasonal peak confirms previous experience.

Tests with penicillin, of which small quantities became available for research in bovine mastitis, indicated that this drug, when administered by udder infusion, is effective in the control of that disease. It is less irritating to the bovine udder than other chemical agents now in use and preliminary tests showed beneficial effects in a majority of cases caused by streptococci and staphylococci. Penicillin was not effective, however, against certain other organisms and resulting types of mastitis infection, nor can it be expected to be more than an aid to required sanitary procedures.

Another development in veterinary science resulting from department research is a practical means of controlling cattle liver flukes. These are small leaflike parasites that inhabit the gall ducts of the liver. When present in large numbers, as is often the case, they seriously affect the health of infested animals. Treatment is based on the discovery that the chemical, hexachlorethane, when combined with a claylike substance known as bentonite, can be suspended in water. The suspension is easily administered with a dose syringe and is highly effective in removing the parasites without injury to the cattle. The treatment is being widely used in several states where liver flukes are a serious drain on cattle production.

Animal Husbandry Research.—The dependence of the livestock industry on research to solve changing problems has become increasingly apparent. In the southern part of the Great Plains, which is an important cattle grazing area, are vast acreages of sagebrush land and much abandoned eroded cropland. Experiments by several department and state agencies have demonstrated that mowing the sagebrush improves yields of range grasses and other desirable forage. This practice almost doubled beef production in about a year. The studies showed, likewise, that overgrazing reduces the growth of grass long before reduced cattle gains become apparent. In the case of abandoned cropland, experiments have demonstrated that it can be made productive rather quickly for grazing beef cattle by seeding it to grass mixtures suitable for the region. Adoption of these improved methods of cattle management is helping to increase the quantity of beef produced on the Great Plains.

Observations of beef cattle in feed lots have shown that vitamin A deficiency is an important nutritional disease of fattening cattle. Results of experiments have confirmed this view. Common symptoms of the deficiency are: night blindness progressing to total blindness, a rough dry coat, lameness, rapid breathing especially in hot weather, and swelling of the legs, shoulders, and brisket. Affected cattle often lose weight and condition near the end of a long feeding period. Animals severely affected sometimes die or, if slaughtered, yield carcasses unsuitable for food. Prevention consists in providing a liberal quantity of green forage, well-cured hay, or silage in addition to the usual fattening ration. Such a ration commonly includes cereal grains, corn, grain byproducts, and protein concentrate. Experiments have shown that yellow corn, though often considered to be a source of vitamin A, cannot be depended upon to prevent the deficiency even though such corn is fed in abundance.

In another nutrition study, sweetpotato meal, a product resulting from the dehydration of sweetpotatoes, proved to be a good feed for fattening cattle in the Southeast. In this area the supply of other carbohydrate feeds suitable for beef cattle is limited, but sweetpotato yields of 200 bushels per acre can readily be produced. Experiments by department and state investigators showed that sweetpotato meal compares favorably with corn when each is combined with a sixth of its weight of cottonseed meal.

In swine production, the heavy losses of young pigs sustained during the suckling period has long been a problem confronting growers. Tests by the department have established the value of electric pig brooders for this purpose. Such a brooder can be built in the corner of a

pen at moderate cost. During damp or cold weather, warmth is provided by a 150 to 200 watt electric light bulb, installed in a frame about a foot above the floor. Besides giving mild heat the light attracts the young pigs so that they remain away from the sow much of the time, thereby reducing the opportunity for her to lie on them or otherwise cause injury.

Sheep breeding studies confirmed results previously obtained on the heritability of various desirable characteristics. These include length of staple (unstretched wool fiber), freedom from excessive wool on face causing wool-blindness, and freedom of skinfolds on the necks of Rambouillet sheep. The results indicate that rapid progress can be made through suitable breeding and selection methods in developing sheep having more of the characteristics desired and fewer faults. A fairly rapid rate of improvement can be expected also when selection is directed toward the production of lambs that develop rapidly and reach good weights at weaning time.

Poultry Improvement.—Chickens that lay eggs of superior table quality are among the products of research by the department's poultry scientists. Some lines of chickens have been bred to produce eggs having a larger percentage of thick white than usual, so that the eggs poach and fry better. Chickens of other lines lay eggs with thicker, stronger, and less porous shells. Such eggs are less subject to breakage and keep better in storage than average eggs. Another line lays eggs almost entirely free from blood spots. The scientists have also bred some birds whose infertile eggs maintain good table quality for as long as 2 weeks at 100° F. Most eggs kept at that temperature are practically unfit for human consumption after about 1 week. These improvements have resulted from the application of principles of breeding and selection that any progressive poultryman can adopt.

Because of the probability that other countries may wish to obtain airplane shipments of hatching eggs from the United States, scientists of the department have studied the effect of reduced atmospheric pressure on hatchability. The tests were made in a laboratory under conditions likely to occur in air transport. Reduced atmospheric pressures corresponding to altitudes exceeding 14 miles had no effect on the subsequent hatchability of eggs incubated at moderate altitudes. Results of several shipments of chicken and turkey eggs later confirmed the experimental findings.

In 45 states, chicken breeders and hatcherymen continued to participate in the National Poultry Improvement Plan, an activity conducted co-operatively by department and state poultry officials. In 26 states, turkey breeders and hatcherymen participated in a similar plan, designed for the improvement of turkeys. Chicks and poults produced under the provisions of these two plans are identified by official terms that inform purchasers of the birds' breeding quality and the measures used to prevent pullorum disease in the breeding flocks. The plans involve official supervision of breeding flocks and hatcheries. Productive strains are developed by trap-nesting, pedigree breeding, and family selection. Then these superior bloodlines are propagated further with the aid of hatcheries.

Bureau of Dairy Industry.—This bureau was established by act of Congress in 1924 to promote the economic welfare of the dairy industry by the investigation of dairy problems and the dissemination of scientific and practical information.

In reporting the bureau's activities during the fiscal year ended June 30, 1945, O. E. Reed, chief of the bureau since 1928, said that wartime advances in nutritional knowledge have aroused new and widespread interest in milk and milk products and that this interest will be both an opportunity and a challenge to the dairy industry in the postwar years.

The opportunity lies in the fact that more people will want more milk and milk products than ever before; the challenge to the dairy industry will be to improve the quality of these products and the efficiency with which they are produced, processed, and distributed, in order to supply the most dairy food to the most people at the lowest possible cost.

Fundamental research has played an important role in dairy progress to date and it will continue to be important for future progress. The average dairy farmer will need better cows in order to further reduce his cost of producing milk. Breeding experiments covering many years and involving many dairy animals have already shown that the milk-producing efficiency of the average farm herd could be materially improved through the use of the right kind of progeny-tested herd sires, or the sons of such proved sires.

The experimental breeding herd of Holsteins at the Agricultural Research Center, Beltsville, Md., where the bureau has now used a succession of 5 proved sires, continues to provide an impressive demonstration of the value of this system of breeding. For example, the average butterfat production of the daughters of the first proved sire was 663 pounds per cow per year; the average for the daughters of the second proved sire, whose dams were the daughters of the first proved sire, was 705 pounds; the average for the daughters of the third proved sire, whose dams were daughters of the second sire, was 768 pounds; the average for the daughters of the fourth proved sire was 837 pounds, and the average for the daughters of the fifth sire was 848 pounds.

The proved sires used in this herd were all selected on the basis of their demonstrated ability to transmit an inheritance for high production and without regard to their relationship to the cows with which they were to be mated. The production records of their daughters thus indicate that, contrary to a theory held by some breeders, it is not necessary to use sires from the same family or strain as their mates in order to obtain good results.

As a part of the proved-sire breeding work at its various field stations, the bureau loans its young unproved bulls to farmer co-operators who agree to keep records on the daughters of the bulls and on the dams of the daughters. The young bulls, which are sons of the proved sires in the experimental herds, are thus "proved" in these outside herds by comparing the production records of the daughters and the dams. This proof on the experimentally bred bulls affords a means of measuring the progress being made toward "fixing" an inheritance for high levels of production in the experimental herds.

Evidence that such progress is being made is seen in the fact that 17 young unproved bulls that were bred at the Jeanerette, La., station and used in nearby farm herds have sired 297 daughters whose average butterfat production was 32 pounds better than the average of the dams. Thirteen, or 77 per cent, of these bulls each sired daughters that were better on the average than

the cows to which they were mated. Bred at the Woodward, Okla., station, 25 young unproved Holstein bulls increased the butterfat production in farmer co-operators' herds by an average of 45 pounds per cow. Twenty-four, or 96 per cent, of these bulls each sired daughters that were better on the average than the cows to which they were mated.

Some of the outstanding bulls thus discovered are loaned for service in artificial-breeding organizations and in co-operative bull associations, where their superior inheritance can be widely disseminated. One proved Holstein bull was loaned to a large co-operative organization in 1941 and in the following 3-year period he "artificially sired" some 3,000 calves. Of the 123 Beltsville-bred bulls now loaned out for service, 26 are in artificial-breeding organizations, 38 are in co-operative bull associations, 45 are in privately owned herds, and 14 are in state institution herds.

In the postwar years, the average dairy farmer will also need to feed his herd better, not only to produce more milk per unit of feed in order to reduce costs, but also to maintain the health and reproductivity of his animals and to produce more nutritious milk. In fundamental studies of the physiological functions of milk production the bureau's scientists are seeking to discover the causes and possible remedies for various forms of sterility and irregular breeding. Pains-taking research to determine the relationship of the cow's diet to the secretion of hormones that control her various functions is gradually building up a better understanding of these relationships.

Already considerable useful information is at hand concerning the important role of roughages in the cow's diet and the need for better methods of harvesting and storing pasture and hay crops to preserve their nutritional values. During the year, comparisons were made of the feeding value of alfalfa hay preserved as silage and as field-cured hay. The silage contained 21 per cent protein and the hay about 15 per unit of dry matter. Cows on the silage produced 7.3 per cent more milk than those on the field-cured hay. At the beginning of the feeding trials the silage contained 9 times as much carotene (the substance from which vitamin A is made in the animal body) as the hay, and as the trial proceeded the hay lost more carotene until at the end the silage contained nearly 14 times as much per unit of dry matter as the hay. Preserving alfalfa as silage avoids the losses that occur in field-cured hay exposed to various weather and handling conditions during curing and storage. The higher carotene content of the silage resulted in a higher vitamin A potency in the milk and in the butter made from the milk.

That there is need for more general improvement in winter feeding conditions on the average dairy farm is indicated by the results of a survey recently completed by the bureau, in co-operation with some 20 state experiment stations. These results show the average vitamin A potency of the creamery butter produced in different seasons and regions in the United States. As was expected, the survey showed that the butter produced under summer feeding conditions, when most cows were on pasture, was higher in vitamin A potency than the butter produced in winter, when the cows were on dry feed. The summer butter averaged nearly 18,000 International Units of vitamin A per pound and the winter butter about 11,000. Since approximately 64 per cent of all the butter produced is summer

butter and 36 per cent is winter butter, the average potency of the total yearly output is approximately 15,000 units per pound.

Butter containing as much as 23,000 international units is frequently produced in summer, under very good pasture conditions, but there are large fluctuations in the vitamin A potency of the butter produced from month to month and from state to state. The difference is largely the result of differences in the carotene content of the roughage feeds available to the cows in different seasons and regions. By proper feeding it is possible to produce butter in winter with the same high vitamin A potency as the summer butter. Until such time as the market demand for high vitamin A milk, or butter, brings the farmer an increased price for high vitamin A potency in these products, however, he must have other profitable incentives if he is to increase the vitamin A potency of his winter product. Research workers are now turning their attention to the development of methods which will be sufficiently practical and economical to enable more farmers to feed as well in winter as they do in summer.

In the dairy products field, one of the important postwar problems will be how to use greater amounts of skim milk and whey for human food. Increasing the food use of the non-fat solids contained in these byproducts would improve the average diet considerably, and at the same time it would be of economic importance to the dairy industry. Research is needed on various phases of the problem, but the bureau's work has already shown that considerable quantities of dried skim milk can be used to advantage in bakery products of various kinds, and in soups, ice cream, and confectionery products. Milk sugar, formerly obtained almost entirely from casein whey, is now being made from cheese whey by processes based on the bureau's research. Milk sugar has numerous uses, the newest being its use in connection with the production of penicillin. Research now under way indicates that cheese whey may eventually be used in making secondary forms of cheese, particularly cheese of the blue-mold type, and some forms of cheese spreads.

During the past year the bureau obtained sufficient new information to show conclusively that it is possible to speed up the ripening of Cheddar cheese by curing it at 60° F. instead of at 50°, provided the milk is of good quality and is pasteurized. Experimental cheeses held at 60° were as fully ripened in from 3 to 4 months as those held at 50° for 6 months, and generally the flavor of the former was much better than the latter.

In view of the fact that laws have been passed recently in several states requiring that all cheese for the retail trade be made from pasteurized milk, or that it be cured for a definite period of time prior to its sale, in order to safeguard consumers from harmful bacteria that might be present in the raw milk, the bureau devised a practical method for testing the cheese to determine whether or not it was made from milk that was properly pasteurized. A decrease of 2 degrees in the pasteurizing temperature, or the addition of as little as 0.1 per cent of raw milk to the pasteurized milk, can be detected by the test.

The successful use of dried ice-cream mixes on board ship and for shipment to military outposts indicates new possibilities for the ice-cream industry, especially the production of dried mixes for sale through stores in small packages for home use. Further research is needed on some

phases of this problem, particularly on the composition of desirable mixes and suitable packages for maintaining keeping quality. In recent studies the bureau found that it would not only be possible but also more economical to add most of the required sugar after the mix had been dried rather than before. As much as 90 per cent of the sugar can be added after the mix is dried, thus avoiding the necessity of dissolving it in water in order to add it to the liquid mix and removing the water later during the drying process.

Research on the manufacture of ordinary ice-cream showed that up to 20 per cent of the sugar ordinarily used can be omitted by reducing the water content of the mix and using milk solids in place of the sugar. Recent reports indicate there is much interest in the process at this time and that the information is helpful in maintaining ice-cream output at a high level in spite of the severe limitations on sugar.

Bureau of Human Nutrition and Home Economics.—This bureau, directed by Hazel K. Stiebeling, included in the year's program research aimed toward helping families to adjust to wartime situations and also research looking to reconversion and the postwar period.

Continuing the collection and interpretation of facts needed for improving living levels, the bureau, in co-operation with the University of Tennessee, completed field work in a study of wartime economic adjustments of rural white families in Tennessee. First tabulations of results showed that in 1944 nearly a fourth of the farm families surveyed had cash incomes under \$500. About 55 per cent received under \$1,000. Only 6 per cent reported \$3,000 or more. The median was \$900, in contrast to the 1941 figures for United States farm families, showing a \$761 median.

The bureau analyzed data on hand and made new studies to assist the department's analysis of various proposals to assure more effective postwar distribution of food, so as to improve nutrition, promote full use of agricultural resources, and provide adequate outlets for food supplies. A special analysis of data collected in 1941 showed that only by allotting more than 40 per cent of income to food could about one-fifth of the urban population be expected to get an adequate diet. Had the group spent this much, it is estimated that their market demand for tomatoes and citrus fruit would have been greater by 60 per cent, for milk and its products by 30 per cent, and for meat, poultry, and fish by 30 per cent.

Family food plans at two cost levels were priced quarterly, using average retail city prices reported by the U. S. Bureau of Labor Statistics. Little change in cost occurred during the year. The average city price in March, 1945, of a low-cost nutritionally satisfactory diet was estimated at \$7 to \$8 a week for a family of two, \$12 to \$13 for four, and \$19 to \$22 for seven. At a moderate-cost level, corresponding figures were \$10 to \$12, \$16 to \$18, and \$26 to \$29. To help young married couples get both nutritional value and acceptable meals for their food money, a popular folder called "Food for Two" was issued, giving moderate and low-cost food plans, with a suggested market list and menus for a week.

Supplementing earlier work on soybeans, peanuts, and cottonseed, the protein values of wheat and corn germs were studied. Wheat germ proved first and corn germ second among these

plant foods as a source of nutritionally efficient protein. These cereal products were inferior in protein quality to egg or to milk when compared at a 15-per cent or higher protein level in an otherwise adequate diet. However, judging by potential annual production, they could become a low-cost source of high-quality food protein if marketed in suitable form.

Continuing the search for rapid chemical methods of determining amino acids in proteins, a satisfactory colorimetric procedure was developed for menthionine, one of the amino acids essential for growth and maintaining good nutrition. By this new method, menthionine determinations were made on selected plant foods important as possible supplements to protein foods from animal sources. Brazil nuts were discovered to contained more menthionine than is recorded for any other food.

As aids to calculating the nutritive value of diets and to planning food production and distribution to meet human needs, tables were completed giving the composition of 275 common foods in terms of protein, fat, carbohydrate, iron, phosphorus, calcium, and five vitamins. The figures included many new data obtained from laboratories throughout the country by co-operation with the Committee on Food Composition of the Food and Nutrition Board of the National Research Council.

In response to a request from the Quartermaster General's Office, a summary was made of the nutritive values of vegetables cooked in large quantities. The wide range found for both actual vitamin content and percentage of vitamin retained in army and other institutional cooking points to the need for additional research on methods of reducing losses. This summary was published.

Research on factors affecting the utilization of carotene by the body showed that the carotene in cooked kale is utilized better than that in cooked carrots. Even at this, the vitamin A value of cooked kale appeared to be only about two-thirds as great as would be expected from a chemical determination of its carotene content. Feeding experiments with an extract of the carotenoid pigments of kale indicated that the difference between the chemical assay and biological assay is due to incomplete digestion of the vegetable. Similar experimentation will be undertaken with other carotene-rich fruits and vegetables. Research to determine the role of vitamin E in carotene utilization is continuing.

An important by-product of this research on carotene utilization was discovery of the inadequacy of the U.S.P. reference cod-liver oil as a standard in vitamin A bio-assays. A report on this work stimulated investigation in other laboratories, and at the recommendation of the U.S. Pharmacopoeia Committee for Vitamin Bio-assays, new substances are being sought to be used as a vitamin A standard in place of the U.S.P. reference cod-liver oil.

In co-operation with the Bureau of Animal Industry and the War Food Administration, studies on dried eggs continued, especially with a view to postwar use. Treatment with sucrose or lactose before dehydration proved effective in lengthening the period during which spray-dried eggs held at high temperature would keep in good condition for cookery. Findings suggest long storage possibilities for lactose-treated eggs held at more favorable lower temperatures. To aid in a proposed consumer acceptance test of dried eggs in the retail market, an illustrated

booklet was prepared giving directions for reconstituting dried eggs and including about 45 recipes.

Studies of home freezing of fruits and vegetables were directed toward finding the best ways of pretreating and packaging foods to retain color, flavor, texture, and nutritive value. Considerable work was done on 10 vegetables and fruits and preliminary work on 5 others. Results attained with peaches show the value of controlled experiments: Packing in 40 per cent sugar sirup was better than packing in dry sugar for retaining natural flavor and vitamin C. To prevent discoloration, 5 anti-darkening agents were tried, and a citric acid dip or addition of ascorbic acid to the pack was recommended for home freezing.

As another aid to the family desiring frozen fruit products, the formula for making Velva Fruit commercially, developed by the department's Western Regional Research Laboratory, was adapted to home use and published in an illustrated leaflet.

To help meet the demand of both manufacturers and consumers for information on design and construction of home freezers, the performance of six freezers was studied. This work showed a need for better insulated tops and lids and better insulation between compressor unit and freezing compartment. It also afforded an illustration of the necessity for developing performance standards for temperature-holding capacity during periods of non-operation. Research on home freezers is continuing.

As part of an investigation looking toward development of textiles for specific uses, various physical properties of cotton fabrics knitted from natural and mercerized carded and combed yarns were compared. Knitted fabrics made from combed yarns proved stronger than those from comparable carded yarns. However, though mercerized yarns were at least as strong as corresponding natural yarns, knitted fabrics made from mercerized were weaker and generally less resistant to abrasion than those made from natural. Fabrics knit from mercerized yarns were less elastic.

In research on the merits of various kinds of clothing construction, a machine was devised for comparing resistance to abrasion of different types of buttonholes. Progress was also made on a method of comparing the durability of different types of seams. These are steps toward formulation of standards of workmanship and construction details that will aid the consumer in buying clothing.

To aid in nation-wide programs dealing with home food preservation, nutrition, use of abundant foods and stretching of those in short supply, clothing conservation, and other home-front problems, results of the bureau's research were called to the attention of the public through popular bulletins, press and radio releases, and picture material for print and screen.

Bureau of Entomology and Plant Quarantine.—Research conducted by the Bureau of Entomology and Plant Quarantine, under the direction of P. N. Annand, chief, has produced results on new developments which promise far-reaching effects upon the general control of insect pests in the future and which will also affect large-scale programs to combat outbreaks of injurious insects. Of special interest is the extension of the usefulness of the aerosol method of dispersing insecticides, both the liquefied-gas aerosol and those in the form of smokes. The practical use

of airplanes for the application of sprays has been made possible by utilizing various types of distributors whereby a concentrated spray is broken into very fine droplets. As little as 1 gallon will give good coverage over an area as large as an acre on certain types of foliage. This opens up new possibilities for the application of liquid insecticide materials from the air. Similar improvements have been made in equipment for applications from the ground. Methods and formulations for use of the important new insecticide material DDT for the control of disease-carrying insects have been developed, recommended to the military forces, and used effectively by them on a large scale. Extensive research to develop its agricultural uses indicates that although DDT is not effective against all insects it will be useful against many important ones which are injurious to livestock and crops. Much still remains to be learned concerning the best formulations and dosages for use against specific pests and on given crops. Certain of its limitations must be worked out before DDT can be used with safety for some purposes.

Investigations of fruit insects during 1944 showed that when used experimentally, DDT gave outstanding control of the codling moth in New York, Maryland, West Virginia, Indiana, and Washington. From $\frac{1}{2}$ to 1 pound of powdered technical DDT appeared superior to 3 pounds of lead arsenate or cryolite. At Vincennes, Ind., combination sprays containing only 4 ounces of DDT to 100 gallons of lead arsenate or nicotine bentonite in half the usual concentration reduced the number of wormy apples to less than half of that resulting from use of the usual concentration of these materials alone. Although residues of DDT on harvested fruit have been found difficult to remove they do not appear to present a serious problem, because the dosages necessary to give effective control will probably not leave residues on harvested fruit heavy enough to be considered dangerous to human health.

Injury to peaches by the oriental fruit moth was reduced considerably in field plots sprayed with DDT at the rate of 1 pound per 100 gallons. Two applications, one each just before the appearance of both second- and third-brood larvae, were more effective than one application made just before the appearance of the second brood. DDT sprays reduced the abundance of parasites but did not eliminate them entirely. The new method of producing the important oriental fruit moth parasite, *Macrocentrus ancylivorus* Roh., from the potato tuber worm was further developed for use under eastern conditions. Continuation of the co-operative federal-state survey for the oriental fruit moth in several western states disclosed presence of the moth for the first time in five counties in Colorado, and in one county each in Utah, Idaho, and Arkansas.

In small-plot fumigation tests at Whittier, Calif., against the California red scale on citrus, kills were obtained under plastic-treated gastight tents with one-third to two-thirds the amount of hydrocyanic acid gas that was required to effect approximately the same kills under canvas tents. Somewhat better kills of this insect were obtained when the hydrocyanic acid was introduced with a blower applicator instead of with the vaporizer now in common use.

One to three applications of DDT (micronized with an equal quantity of pyrophyllite and with glue as a wetting agent) at the rate of 1 pound to 100 gallons of spray gave almost com-

plete control of Japanese beetles on peach, early apple, grape, blueberry, and a miscellaneous group of ornamental and shade trees and shrubs. In soil tests 25 pounds of DDT per acre appeared to be more effective against third-instar larvae in various types of soils than 1,000 pounds of lead arsenate. At this dosage the material was found to be as effective after 75 weeks in the soil as when first applied.

Intensive survey and inspection during 1944 and early in 1945 revealed that there has been practically no extension of the area in California infected by the Hall scale. As a result of spray applications the scale population has declined. A fumigation program is now being started and the prospect of ultimate eradication of the infestation appears favorable.

The area in the Pacific Northwest known to be infested with pear psylla remained essentially the same as in previous years, except for some northward extension in British Columbia.

In investigations of forest insects the spruce budworm was found in June 1945 to be generally distributed throughout the Adirondack area in New York and the spruce-fir area in Vermont. Most of the infestation, by previous standards, was light, although defoliation was noticeable in a few places.

The outbreak of the Engelmann spruce beetle in Colorado continued unabated, killing over 1 billion board feet of Engelmann spruce in 1944, and bringing the total loss of timber to approximately 2 billion board feet during the last 3 years. Extensive surveys showed the infestation to be increasing in area and severity. The discovery that the Engelmann spruce beetle hibernates beneath the bark at the base of the trees during the second winter, a habit unknown to closely related beetles, has an important bearing on control methods.

In 1945 the program of experiments in the control of forest insect pests (such as gypsy moth, spruce budworm, pine tip moth, pine spittle bug, hemlock looper) with concentrated DDT sprays distributed from an airplane has been greatly expanded and improved spray formulas have been tested. Considerable progress in improving and simplifying distributing apparatus has been made through co-operation with the Bureau of Plant Industry, Soils, and Agricultural Engineering of the U. S. Department of Agriculture. Special emphasis has been given to airplane applications of DDT in Quebec, Ontario, New York, and Colorado to determine whether the spruce budworm can be economically controlled by this method. Preliminary results of these tests are very encouraging.

In tests during 1945 the gypsy moth was controlled with $\frac{1}{4}$ pound of DDT in 1 gallon of solvent per acre. This season's work has demonstrated conclusively that DDT is the most effective and economical insecticide discovered for control of the gypsy moth, and its distribution by aircraft and improved spray equipment offers for the first time a practical means for controlling woodland infestations of this insect. DDT has also been found to be very effective against the group of elm insects suspected of transmitting the elm virus disease organism.

Because the general use of DDT over large forested areas cannot be recommended until the possible detrimental effects to beneficial insects, fish, and wildlife have been determined, large wooded areas were treated in 1945 for a study of this problem. The results of these investigations have not yet been summarized.

Tests with various types of airplanes have demonstrated that the helicopter may prove very useful in treating woodland areas too large for economical treatment by ground equipment and too small for economical fixed-wing plane applications.

Investigations in the control of insect pests of cereal and forage crops included tests with DDT against the more important insect pests of these crops. Good control of the European corn borer was provided by various spray and dust formulations; dust mixtures were found very effective as barriers against chinch bugs; injections of DDT in mineral oil into silk channels of the ears gave almost perfect control of the corn earworm (it was the only insecticide that protected seed corn until harvest). The hazard of toxic residues of DDT in sweet corn ears has not yet been definitely determined.

DDT dust was more effective against the vetch bruchid than rotenone dust or a liquid bait spray composed of calcium arsenate, sugar, and water and gave excellent control of heavy infestations in Oregon. It also gave outstanding control of *Lygus* bugs in seed alfalfa in Utah.

A 6-per cent solution of DDT in refined kerosene sprayed on the walls and woodwork of a warehouse and farm-type wooden grain bins killed large numbers of grain-infesting insects in them.

Wrappings coated or impregnated with DDT, acrylamide, or a trichlorobutylamide were highly effective in preventing insect entrance into packages of cereals in experimental tests.

Cryolite was found effective for controlling a webworm in lespedeza. It also continued to provide better control of the sugarcane borer than other materials tested, including DDT.

Potassium fluosilicate appeared to be about as toxic as cryolite to adult white-fringed beetles.

Tests in a commercial flour mill showed that fumigation of machinery units every 3 weeks held the insect infestation at a low level to insure the production of insect-free flour. Carbon tetrachloride and various mixtures of carbon tetrachloride with ethylene dibromide or trichloroethylene gave promising results as grain fumigants.

During 1944 the European corn borer was found for the first time in Kansas, Nebraska, and Tennessee, and in a considerable number of counties outside the territory previously known to be infested in 10 other states. Borer infestations were generally lower in 1944 than in 1943 in the eastern part of the infested area, while farther west in the Corn Belt the borer was much more abundant in 1944.

A survey in the fall of 1944 revealed greater numbers of chinch bugs in hibernation, especially in the Corn Belt states, than had been present in any year since 1934. Moderate to very severe infestations were found in some sections, but the serious damage in prospect for 1945 was largely prevented by continuous cool wet weather during the spring and early summer.

Grasshopper infestation remained generally at a low level in 1944; however, there were several important shifts in economic populations. Substantial increases occurred in Montana, Wisconsin, and Wyoming, and slight increases in Arizona, Colorado, Oklahoma, Texas, Utah, and Washington. There were significant decreases in Kansas, North Dakota, and South Dakota.

Special emergency surveys of insects that attack vegetables and their control requirements

have been continued, in co-operation with state workers, industry, and other agencies.

DDT in dust and spray forms and as an aerosol has proved to be very toxic to a number of common insect pests affecting vegetables; however, it has shown low toxicity against some others, notably the Mexican bean beetle, the tobacco hornworm, the turnip aphid, and a few others. The tolerance of vegetable plants to this insecticide has been high.

Dust mixtures containing 1 or 2.5 per cent of DDT were superior to all other insecticides tested during the spring of 1945 to protect cabbage in South Carolina from caterpillar damage. If current research reveals that the use of DDT on cabbage does not incur a harmful residue hazard or result in plant injury under the widely divergent conditions where cabbage is grown, it appears that DDT will prove to be a very effective remedy for cabbage caterpillars. Until more definite knowledge on the residue situation is obtained, its use on cabbage and related crops will be subject to the same limitations as that of arsenic and fluorine compounds.

Large-scale tests in commercial sugar beet fields demonstrated that one application, by airplane or with conventional ground equipment, of a dust containing 5 per cent of DDT at the rate of 30 to 40 pounds per acre has exerted a control of *Lygus* plant bugs surpassing that of two applications of the pyrethrum-sulphur or sulphur-dust mixture. Studies indicated that the use of DDT did not affect adversely the yield of sugar beet seed or its viability.

Early in 1945 the DDT aerosol with methyl chloride as the propellant agent was used on large field plots of peas for pea aphid control, and encouraging results were obtained. In the greenhouse, DDT in aerosol form was found to be very effective against several species of insects affecting vegetables grown under glass. Under greenhouse conditions the aerosols were applied with special dispensers.

Tests and observations on the effect of applications of insecticides by airplane, in co-operation with other agencies, have shown that rotenone dust applied to beans by airplane in North Carolina was not so effective against the Mexican bean beetle as when applied by ground machine. In Washington, cryolite dust applied with ground equipment to potato fields gave better results against potato flea beetles than when applied by airplane. In Washington and Oregon good results were obtained from aerial applications of dust mixtures containing DDT or rotenone for control of the pea weevil and the pea aphid. In these tests the airplanes were as effective as ground equipment under comparable conditions when the same insecticide was used. Satisfactory results were recorded in using airplanes to apply dusts containing DDT for the control of *Lygus* plant bugs and the beet leafhopper on sugar beets grown for seed in Arizona. Hornworms and flea beetles on tobacco were controlled successfully in North Carolina by airplane applications of cryolite dust mixtures. The results obtained thus far indicate that the use of aircraft for applying insecticides to some vegetable and tobacco crops has a promising future.

In experiments against insect pests of cotton it has been found that DDT was not effective against the boll weevil or the cotton leafworm, and caused an increase of the cotton aphid and the common red spider. It was effective against the bollworm, the cotton flea hopper, and several

other mirids, stinkbugs, the onion thrips and tobacco thrips, and the beet armyworm on cotton.

In laboratory tests 2.5- and 5-per cent DDT dusts caused low mortality of the boll weevil, but 10-per cent dust approached calcium arsenate in effectiveness. In field plots several applications of 5-per cent DDT dust failed to control the boll weevils and 2.5 per cent added to calcium arsenate did not increase the mortality or the yield of cotton as much as did the calcium arsenate treatment.

Preliminary experiments late in the season of 1944 indicated that DDT was the most promising material that had been used against the pink bollworm. Dust applications of approximately 15 pounds per acre of DDT in pyrophyllite, beginning when the cotton bolls were large enough for the pink bollworm to infest them and repeated at 5-day intervals, caused from 53 to 94 per cent reduction in larval populations.

Losses from boll weevils and other cotton insects in 1944 were the lowest in recent years. Although early season abundance of these insects, combined with a late planting season and favorable weather for insect development during the early summer, indicated severe damage to cotton, conditions were changed by hot, dry weather during the critical period of insect development. The damage caused by the boll weevil in 1944 was the least for any year since 1911. The unfavorable conditions for weevils and the favorable conditions for cotton resulted in the highest yields per acre ever recorded in the United States.

Further evidence of the value of feeding a pollen-soybean flour supplement to honeybees has been obtained. Feeding pollen and soybean flour to unprotected colonies in winter resulted in better colony development early in the spring than did the generally accepted method of heavily packing colonies for winter without supplemental pollen feeding. In limited tests, bees fed clover pollen supplemented with soybean flour reared more brood than those fed unmixed rye grass, star-thistle, partridge-pea, and clover pollen alone, the figures being 32,400 bees (over 6 pounds) per pound of supplement against 2,350 bees (about $\frac{1}{2}$ pound) per pound of unmixed rye-grass pollen.

In investigations of insects affecting man and animals, the effectiveness of DDT has been found to be outstanding in its toxicity to mosquitoes. An important accomplishment in this field is proof of its residual value in controlling malaria. For the first time a material has been shown to be effective in reducing mosquitoes and flies by simply spraying it on the walls of dwellings or barns. Research on DDT has also given mosquito-control workers for the first time a material that can be applied from various kinds of aircraft and with one operation will destroy the larvae in the water and the adult mosquitoes on the wing. Liquid larvicides containing DDT were found more effective in the destruction of mosquito larvae than were dusts containing the same toxic agent.

In tests for the control of the stablefly (dog fly) in marine grass deposits along the coast of western Florida it was found that 0.5 per cent of DDT in bay-water emulsion applied at the rate of about 2 gallons per 100 square feet of grass surface gave effective control of the emerging flies.

Tests to determine the minimum concentrations of DDT required for the control of lice on cattle disclosed that all the motile forms of the

short-nosed louse and the red louse were killed by a concentration of DDT as low as 0.08 per cent.

Field tests showed that one dipping of goats in a solution made of 1 part of DDT in 5 parts of soluble pine oil in 100 gallons of water killed the motile stages of all three common species of goat lice.

Preliminary tests with sprays containing 1 per cent of DDT for the control of clothes moths and carpet beetles in large storages of raw wool infested with these insects gave promising results.

It was found that a combination of dimethyl phthalate, Indalone, and 2-ethylhexanediol was effective for use as a repellent against malaria mosquitoes found in the United States and was more generally effective on every individual against various mosquitoes and biting flies than was any of these compounds alone. This development enabled the armed forces to issue a single repellent for the protection of personnel for several hours.

Two other important developments were the repellents dimethyl phthalate, emulsified and applied to the outer garments to give protection against chiggers, and benzyl benzoate for impregnation of clothing to furnish protection against the Pacific mite which transmits scrub typhus.

Some progress was made in developing two new smears that contain chlorophenoxathiin, for treatment of screwworm-infested animals. The new smears showed a distinct advantage over those containing diphenylamine in that the materials did not become hard and crusty on the wound after the benzene had evaporated.

Identifications by authoritative specialists were made for 59,492 insect samples contained in 30,184 lots received from sources requiring identification for the institution of proper control or quarantine action or in connection with the conduct of experimental work. In addition, identifications of approximately 6,000 samples of insects and mites involved in human health problems or recovered on aircraft were made for the army and navy and direct assistance or instruction in insect classification was given many officers of both branches of the armed service.

The importation of insect parasites and predators has been continued. Special emphasis was placed on the importation of parasites of the vegetable weevil and the cotton boll weevil from South America. A new co-operative project with the California Agricultural Experiment Station for the biological control of the Klamath weed was initiated in the fall of 1944. Large-scale shipments of two leaf-feeding beetles and a root borer that attack this weed were received from Australia through the courtesy of the Council for Industrial and Scientific Research. These are being tested on several economic crops and field releases of one species, *Chrysolina hyperici* Foerst, have already been made in northern California.

Investigations on the chemistry of DDT disclosed that none of the other compounds present were equal to *p,p'*-DDT (1-trichloro-2,2-bis-(*p*-chlorophenyl)ethane) in insecticidal effect. Solutions, emulsions, powders, and aerosols containing DDT were formulated for various insecticidal purposes. Specifications were worked out for commercial grades of DDT and for certain DDT preparations. Experiments on methods of removing DDT spray residues from apples were carried on in co-operation with the Bureau of Plant Industry, Soils, and Agricultural Engineering.

The search has continued for new insecticides and fumigants to replace those that were scarce

or not available because of war conditions. Two new nicotine compounds were found to be more highly toxic than free nicotine. A new insecticidal material the active principle of which is the gamma isomer of benzene hexachloride was tested and found to be more toxic than DDT to some insects and less toxic to others.

Further tests were made in the adaptation of heat-generated, or "smoke," aerosols for the control of agricultural pests. The aerosol from a generator developed for the military services gave promising results when applied from airplanes against larvae of the gypsy moth infesting forest areas in New England.

Tests were made of the latest models of power blowers in dispersing insecticides in finely atomized form. It has been found that the mist blower is especially well adapted for treatment of shade and roadside trees and orchards. Much less spray material is used by this method than by the conventional application of dilute sprays with power sprayers.

There was a 59-per cent expansion in the 1944 Japanese beetle trap-scouting program. A considerably wider area was surveyed, particularly in Florida, North Carolina, and New York. Beetles were captured for the first time in 36 new localities. Military and commercial airports west of the Mississippi River were also included in this program.

A large-scale field experiment to control the Japanese beetle with DDT was undertaken at an established, isolated infestation at Blowing Rock, N. C. A dust consisting of 10 per cent of micronized DDT in pyrophyllite was applied as a dry-surface treatment to the soil on approximately 225 acres, and 10,000 gallons of spray mixture containing 1 pound of DDT per 100 gallons of water was applied to tree and shrub foliage in the same area.

In connection with control activities against the gypsy moth, emphasis was placed on use of the sex attractant to trap male moths and on manual types of surveys to delimit the area of infestation and to locate all infestations of sufficient severity to represent an appreciable hazard of natural spread. Control measures included co-operation in extension experiments with DDT in several of the areas most heavily infested with gypsy moth, particularly in Pennsylvania and in the New York-New England section.

During 1944 there was some extension of the area infested by the white-fringed beetle. This pest is now known to occur on a total of 140,000 acres in Alabama, Florida, Louisiana, Mississippi, and North Carolina. Insecticides, in the form of dusts and dilute and concentrated sprays, were applied to an aggregate of 68,702 acres in order to reduce populations at places from which there was danger of spread and on crops the marketing of which presented a hazard.

During the calendar year 1944 sweetpotato weevil eradication activities conducted by the bureau, in co-operation with growers and state agencies in 29 counties in Alabama, Florida, Georgia, Louisiana, Mississippi, and Texas, resulted in the release from planting restrictions of 2,106 of the 2,431 farms known to be infested at the beginning of the year. Farms are released when no weevils have been found on them during a period of at least 12 months.

Additional infestations of the pink bollworm discovered in southern and northwestern Texas in 1944, together with new discoveries during the crop season of 1943, increased the threat of spread of this insect throughout the entire Cotton

Belt. Infestations were found in 16 additional Texas counties in 1944, and 2 counties previously released from quarantine were found to be reinfested. Light infestations were found in nearly all counties of the quarantined part of northwestern Texas.

Grasshopper control operations concluded during the summer of 1944 gave protection to 4,750,000 acres of crops worth more than \$22,000,000. Approximately 2,200,000 acres were baited in the combined operations. Adult and egg surveys made in the fall of 1944 indicated that the grasshopper infestation in 1945 would be of approximately the same extent and intensity as that in 1944. Cool, wet weather, which prevailed over much of the infested area throughout the spring months of 1945, greatly reduced grasshopper hatching and development and delayed control operations.

Operations in connection with the Dutch elm disease control program were modified to concentrate on determining where the disease occurs, on advising elm owners of the nature of the disease and recommending ways of combating it, and on testing methods of disease control in selected areas. There was some extension of the known limits of infection, and this afforded a basis for establishing quarantine regulations to prevent movement of host material to uninfected areas.

Barberry eradication work during the year involved complete coverage of 10,384 square miles and destruction of 1,094,726 barberry bushes. No general epidemic of stem rust developed in 1944, although there were severe local epidemics in some sections west of the Mississippi River. East of the Mississippi the amount of damage was negligible.

The white pine blister rust control program was conducted during 1944 on much the same basis as for the previous calendar year and, in general, accomplishments were about the same. Control work performed resulted in the removal of over 16 million ribes bushes from 969,372 acres of control area, of which 490,014 acres were initial eradication and 479,358 acres rework.

Revised Japanese beetle quarantine regulations were issued, effective Feb. 17, 1945. This revision brought within the regulated area sections of Maryland, New York, Ohio, and Pennsylvania. The use of tight railway refrigerator cars for the bulk fumigation of plant material with methyl bromide was authorized during the year.

A revision of the pink bollworm quarantine (foreign) and regulations provided for the entry of cottonseed and cottonseed hulls from sterilized seed produced in portions of the state of Tamaulipas, Mexico, effective Nov. 11, 1944. Effective Nov. 9, 1944, the quarantine (domestic) and regulations were revised to include recently found infestations of the pink bollworm in southern Texas.

Developments in the war situation strongly affected plant-quarantine enforcement at maritime ports. Ship arrivals during the fiscal year 1945 increased 30 per cent over those of 1944 to a total of 35,555.

The army program for returning troops from Europe by airplane accelerated the rapid growth of air-borne commerce in 1945. During the fiscal year ended June 30, 1945, 45,728 airplanes were inspected at 42 ports of entry, which represents an increase of 112 per cent over the previous year. It was necessary to provide plant-quarantine protection at 5 ports formerly without this service. Plant-quarantine inspection has now been

inaugurated in Alaska, a step brought about by air traffic into the territory.

The survey of the more important food crops growing in the environs of ports of entry and international airports on the Pacific, Gulf, and Atlantic coasts and along the Mexican border for introduced pests, commenced in June 1943, was continued. Approximately 12,000 lots of insect material and 2,000 lots of plant pathological specimens were submitted for determination during the year ended June 30, 1945. Identification disclosed several insects known to be of economic importance in foreign countries and heretofore unknown in the United States as well as new distribution records for a number of insects known to occur in limited areas in the United States.

Office of Experiment Stations.—The primary functions of the Office of Experiment Stations under the direction of James T. Jardine, chief, are to represent the U. S. Department of Agriculture in the administration of the acts of Congress authorizing appropriations for the support of the state and territorial agricultural experiment stations in the 48 states, Hawaii, Alaska, and Puerto Rico, and to administer the federal experiment station in Puerto Rico. The Hatch Act of 1887 authorized federal aid to the states in establishing the experiment stations for the purpose of aiding in acquiring and diffusing useful and practical information on subjects connected with agriculture and promoting scientific investigation and experiments with respect to the principles and applications of agricultural science.

In carrying out this purpose the needs of the United States and the individual states and territories are each given due attention. With this broad objective in mind, the office advises and assists the experiment stations in planning their research programs and, through annual review of projects, offers suggestions as to current progress and proposed work under the federal-grant funds, having in mind the promotion of maximum accomplishments and co-operative effort to avoid duplication. In reviewing new projects proposed by the stations, consideration is given to the possibility that the objectives of the work may be aided by arranging co-operation with department research along similar lines, and specific suggestions are made where pertinent. When agreement is reached as to co-operation between department agencies and stations, memoranda of understanding are developed which specify the facilities, personnel, and funds to be furnished by each agency. More than 1,100 formal memoranda of understanding, representing approximately 1,000 separate co-operative undertakings, are now in effect. Many of these memoranda provide for research on regional or national problems with groups of stations and the department. In such cases each station may work on some local aspect of an over-all problem, as, for example, the improvement of small grains to meet the particular requirements of the state or local area. In the aggregate, effective service is rendered to the major regions and the nation as a whole by adapting local findings to larger areas.

In 1945 the experiment stations had available for use under the federal-grant acts a total of \$7,001,208. They also had available for agricultural investigations from non-federal sources approximately \$20,000,000. Station research programs under the federal funds were carried out under a total of 3,434 projects, of which 516 were new or revised during the year. Approximately 4,800 research projects were supported by non-federal funds. As in previous years, the stations

in 1945 were again taxed to the limits of their resources to keep pace with the demand for facts needed to assure maximum production of agricultural products and their effective use to promote the war effort. Each of the stations contributed new information helpful in the solution of local problems and shared with federal agencies in the assembling and interpretation of data on which national and regional agricultural programs were based and high production achieved.

A wartime job undertaken at the request of the National Research Council was the nationwide survey of the vitamin A content of butter. The study was made by the Bureau of Dairy Industry and the Office of Experiment Stations in co-operation with 19 state agricultural experiment stations. Samples of butter were obtained in the usual commercial channels during different seasons and in the principal areas of the participating states. The carotene and vitamin A content was determined by uniform methods worked out by a technical committee. Data obtained were assembled in a preliminary report published by the department, with a more detailed technical report to follow. The average butter produced in the United States was found to contain over 15,000 international units of vitamin A per pound, or enough to supply under normal consumption about 15 per cent of the recommended daily intake.

More than 100 progress notes have been released giving results to date under the national co-operative studies on conservation of nutritive values of foods. Practically every station aided the study by investigating one or more foods. Information developed by these studies has been given prompt local application and has been helpful nationally as a guide to better nutrition. The office continued to assist in co-ordinating the work and rendered other help of an over-all character.

All stations contributed during the year as formerly to the development and interpretation of information needed in setting up production goals and for postwar planning.

Continuing work undertaken last year upon request of the War Food Administration, the office assembled information on current and proposed investigations of the stations on the feeding value of potatoes for different kinds of livestock. In all, 16 stations reported on current, proposed, or past investigations in this field. The information was issued by the office in mimeographed form for use by the stations, the War Food Administration, and the department.

For many years the office has issued annually a mimeographed list of projects and publications covering experiment station research in home economics. Because of the current widespread interest in foods, this compilation has been expanded to include as far as possible all state experiment station research pertaining to foods and nutrition of interest to the consumer, regardless of the station, department, or division involved.

Printed publications issued during the year by the office included the report of the chief of the office for 1944; the report to Congress on the agricultural experiment stations for the fiscal year 1944; a list of workers in subjects pertaining to agriculture in land-grant colleges and experiment stations for 1944-45; and two publications of the federal experiment station in Puerto Rico. A total of 6,958 abstracts of current scientific research in agriculture and home economics were published in volumes 91 and 92 of the *Experiment Station Record*. In selecting material for abstracting, especial attention was given to publications of di-

rect interest to American workers appearing in such foreign publications as were available. Included among these were a considerably increased number from Latin America.

The federal experiment station in Puerto Rico, under the administrative supervision of the office, conducts research aimed at increasing the production of strategic agricultural crops of value to the United States and improving practices to make the growing of tropical crops of greater economic benefit to the people of Puerto Rico. Problems of immediate concern involve the production of rotenone-producing plants, the growing of *Cinchona*, from which quinine is obtained, and the improvement of other crops, including breeding, insect pest and disease control, and culture.

In carrying out the program of increasing sources of rotenone in the Western Hemisphere, plantings of over 35,000 plants of high-yielding strains of *Derris* were established by the station and more than 2½ million plants and cuttings were furnished for distribution throughout Latin America. To facilitate development of an American source of quinine, several thousand seedlings grown from seed of *Cinchona* flown out of the Philippines just before the Japanese occupation are now field-planted in Puerto Rico.

Seed and other planting material of food crops on which the station has worked experimentally were distributed during the year in conjunction with the war emergency program of the insular government. The distribution included USDA-34 sweet corn, Seminole soybeans, and yams. The USDA-34 sweet corn, a variety developed by the station several years ago, has attained particular prominence during the year. It has become widely distributed throughout the tropical islands of the Pacific, shipments of seed having been transported by air from Puerto Rico to such points as New Guinea, Guadalcanal, and other islands in order to provide fresh sweet corn for our armed forces. This is the only variety of sweet corn particularly adapted to tropical conditions.

The Tropical Plant Introduction Garden established by the station in 1902 now includes over 7,000 species of tropical plants of present or potential value as sources of planting material. The garden has served as an important source of material for the research program of the station and for distribution to meet many requests from the armed forces and countries in Latin America. At this time the station, through the co-operation of other agencies, is assembling the highest yielding strains of the rubber tree *Hevea brasiliensis* from the Far East and Brazil.

E. G. MOORE,
Co-ordinator, Information and Publications, Agricultural Research Administration, U. S. Department of Agriculture.

AGRICULTURE, Review of. Farm production in the United States in 1945 resulted in the largest volume of food grains on record, the second largest volume of feed grains, and the second or third largest quantity of livestock products. Crop and livestock production together was nearly as large as the country has ever produced. Up to the time small grains were mature the farming season was greatly in their favor, though it was less favorable for other crops. Then it became favorable for the late maturing crops, which previously had encountered unfavorable weather. Harvesting of most crops was accomplished with a minimum of loss.

Preparation of seedbeds in the fall of 1944 was difficult, and farmers had to sow consid-

erable acreages of fall grains in dry ground or later than usual, particularly in the southern Great Plains, the Pacific Northwest, and to some extent in the corn belt. But October rains speeded seeding operations and enabled grains seeded in the dust to germinate. Yield prospects at the beginning of the winter were above average, and early spring conditions further improved them.

Fall sown grains emerged from the winter in good condition; hay and pastures made an excellent start. By April 1, thanks to an unusually warm period in late March, the seeding of small grains was further advanced than usual. Stocks of feed grains were abundant and liberal feeding coupled with favorable weather resulted in record rates of production of milk and eggs. Fruit, early vegetables, gardens and some other crops, however, suffered from widespread freezing temperatures. Excessive rains and floods over wide areas caused damage and loss of acreage, while cool weather retarded vegetative growth and restricted the germination of spring sown crops.

One of the coldest Mays on record, with occasional frosts and persistent rains, impaired crop prospects and delayed spring planting operations. Drought developed in the Southeast and threatened to develop in the Southwest. But farmers took advantage of every break in the weather, mustered and pooled available power equipment and family labor, and planted a surprisingly large acreage, though later than usual. Some corn acreage was not planted until well after July 1.

Heavy production of small grains was assured by ideal July weather for filling, maturing, and harvesting of these crops which offset the factor of lateness. Hay and pastures flourished. Corn, however, developed slowly until favored by warmer and dryer weather in August and September. Frosts at near usual dates in parts of the corn belt resulted in considerable "soft" and "wet" corn.

Combined acreage of all crops harvested was estimated at 353 million acres. This was only slightly less than in 1944, and was the second largest since the period 1928 to 1932, when the range was 353 to 363 million acres. Farmers could not plant all the planned acreage of corn, sorghums and small grains, particularly barley. A big shift took place from row crops to small grains, encouraged by lighter labor requirements for the latter, by favorable planting conditions in late fall and early spring, and by light abandonment of winter wheat. Increased acreages of tobacco, sugar beets, and truck crops were planted, despite high labor requirements. On the other hand, the acreage of cotton was reduced 10 per cent from 1944 to 18,355,000 acres, the smallest acreage of the century. Farmers planted less than the goal acreages of corn, barley, rye, flax, sorghum, potatoes, sweet potatoes, dry beans, soybeans, peanuts, cotton and sugar crops. In the aggregate these crops were nearly 12 million acres or 3 per cent below the goals. Crops requiring large amounts of labor usually did not reach the acreage goals.

A second successive billion-bushel wheat crop was harvested. The 1,150,000,000 bushels produced exceeded the previous record crop of 1944 by nearly 7 per cent. The yield, at 17.7 bushels per harvested acre, was well above the average, though it has been exceeded several times. The relatively large proportion of the seeded acreage of winter wheat remaining for harvest as grain, coupled with a relatively large spring wheat

crop, were major factors in the record production. The rye crop was relatively small, though yields were well above average. Rice yielded well and produced a record crop in spite of a disastrous tropical storm in the rice area of Texas. Buckwheat production was above average, but below that of 1944.

Corn production, for the fourth successive year, exceeded 3 billion bushels; the corn crop was the third largest of record. The yield per harvested acre was exceeded only in 1942. About 64 per cent of the acreage was planted with hybrid seed. This was an important factor from the yield standpoint, and in enabling the crop, which had been planted under adverse conditions, to mature quickly and uniformly enough to escape major frost damage. Frosts occurred at about the usual dates in the northern and western corn belt.

Farmers harvested the first 1,500,000,000 bushel oats crop. Moderate temperatures and abundant moisture in main producing areas prolonged the development period, counteracted the effects of late planting, and resulted in high test weight and a heavy yield per acre, particularly in states with large acreages of oats. Barley, grown on a smaller than average acreage, made the highest yield per acre since 1915, and the production was slightly above the average. Acreage of sorghum grain was limited by relatively light abandonment of wheat acreage in the Southwest, where abandoned wheat land is often replanted to sorghums. On much of the acreage the sorghum crop was planted late. Moreover, it suffered from dry weather and from frosts; nevertheless, although much below the 1944 crop, it was the third largest ever produced.

Cotton production, on the smallest acreage harvested since 1885, was less than 9,500,000 bales and with the exception of the 1921 crop was the smallest since 1899. Plantings were late and the season was unusually wet. As a result, the growth was rank, and harvesting and ginning extremely slow.

Tobacco, for the first time in history, passed the 2 billion pound mark. Good growing conditions favored the late crop. Production of peanuts was more than 2,174,000,000 pounds—near the all-time record. It was 47 per cent above the 1934-43 average. Production of soybeans fell below the large crops of 1943 and 1944. Much of the soybean acreage was planted late and the pods did not fill as well as was expected. Dry beans were the smallest crop since 1936, and many of the beans were immature or damaged by frost and rain. Hay, potatoes, and flaxseed were near-record crops, and the output of sweet potatoes was above average.

The citrus crop promised to be a record. Peaches, pears, and sweet cherries were record crops. On the other hand, apples, and sour cherries were record lows. Together, the citrus and deciduous fruit crops were about 4 per cent less than in 1944, but 18 per cent above the average. Production of tree nuts was slightly less than in 1944, and about a third more than average. Production of commercial vegetables for the year set a new high record; it was at least a fourth above average. Output of vegetables grown for processing exceeded the average by more than 40 per cent. Seed crops suffered from unusually wet weather at harvest time; yet the production was above average, and indicated relatively few seeds would fall short of 1946 requirements.

Total food grain production was 37 million tons—2 million tons more than in any other

year. Total feed grain production was 121 million tons. Together with the big hay crop and a large tonnage of other roughages, it gave a feed supply exceeded only once before—in 1942. At the beginning of the October feeding season, supplies of feed per animal unit were the largest in the 20 years of record. Pastures and green feeds were abundant until the late date.

Production of livestock and livestock products in 1945 was at about the same level as in 1944—only 5 per cent below the all-time high of 1943. It was estimated that approximately 45 billion pounds live weight of cattle, hogs, sheep, and poultry would be produced in 1945, or about 6 billion pounds less than the 1943 production and slightly less than that of 1944 or 1942, but substantially more than that of any other year. Milk production promised to establish a new record at about 123 billion pounds; production per cow was near the record level. Farm poultry produced eggs at a record rate per layer; but the number of layers averaged 8 per cent less than in 1944. Farm production of eggs in 1945 was expected to reach 4,600,000,000 dozen—second only to the 1944 record.

Farm-Producing Capacity.—In 1944 and 1945, the volume of American farm production for sale and for use in the farm home was about one third higher than in the prewar years 1935-39. Probably not more than one fourth of the wartime increase in farm production can be attributed to better than average weather. True, the weather was favorable during the war years. But an analysis of other major factors involved, notably shifts from animal to tractor power, increased use of fertilizer and lime, the use of improved crop varieties, the increased use of cover crops and other conservation practices, pest and disease control, and better feeding of livestock, shows that influences other than weather account for most of the wartime increase in output.

Farmers adopted improved practices to an extent in the war years that could not have been predicted from prewar trends. Financial and patriotic incentives brought about almost a technical revolution. For example, use of commercial fertilizer plant nutrients in 1944 was 85 per cent above the prewar (1935-39) average. Use of lime almost tripled. Acreage of winter cover crops increased more than threefold, and other conservation practices came into use extensively. Adoption of improved varieties such as hybrid corn, the shift to intertilled crops such as soybeans, peanuts, and corn, and a pronounced shift from grass hay to legume hay, resulted in notable production gains.

Livestock feeding practices showed great improvement, both in the use of high protein feeds and in the balancing of concentrates with roughages. Livestock output is still far above prewar levels. Since the fall of 1943 it has been maintained only to a very moderate extent by drafts on feed grain reserves and grain imports. Most of the increase has resulted from current production of grain, hay, and pasture. Meat and milk production benefited greatly from a more adequate balancing of rations.

Manifestly, technical progress of the kinds above mentioned may be expected to carry over strongly into peace years, since it reduces production costs. The wartime increase in mechanical power will probably continue. This is the continuation of a long-time trend, which began noticeably with the First World War years. Since 1920, the shift to mechanical power on

farms, paced by a decline in the number of work animals in cities, has released about 50 million crop acres formerly required to produce feed for work stock. This land is now producing foods and fibers. Mechanization advanced in the war years despite restrictions on farm machinery production, with the result, for example, that on Jan. 1, 1945, the number of tractors on farms was 12 per cent greater than on Jan. 1, 1942. Probably farmers will buy new tractors and other equipment in greater quantities than ever when the supply permits. Such machinery, besides saving labor on the farm, saves time when time is precious, as in seeding or harvesting.

Probably some of the wartime increase factors will be stronger in postwar years, mechanization particularly. Substitution of tractors for work animals may release as much as 10 million additional acres of cropland by 1950. This will have a favorable influence on yields, because it will facilitate more thorough tillage and more timely performance of crop operations.

Farmers may use fertilizer in greater quantities. Many of them have had a very profitable experience with fertilizers; they would have used more in the war years had more been available. Under prosperity conditions as shown elsewhere in this report, it would pay most farmers to use more fertilizer and also more lime. Certainly, the increased use of fertilizer will not disappear when the war is over; nor will the greater use of winter cover crops and other soil-improving practices.

Use of improved varieties, after an initial expansion, tends to level off. For example, the percentage increase in the use of hybrid corn may be expected to decline. But the plant scientists, through experimentation with additional crops, are constantly providing new opportunities. Livestock raising will undoubtedly continue to make more use of balanced rations. Some decrease factors, notably conservation reasons for reducing the acreage in intertilled crops and for restoring some land to permanent grass cover, will not substantially change the balance of forces.

On the whole, the technical forces that make for increased production on the increase side are much stronger than the forces on the decrease side. How they will operate in postwar years depends greatly on the postwar level of farm prices. With returns fairly satisfactory, farm production for the market could rise by say 1950-55 to possibly 45 per cent above the prewar average. Under depressed conditions, with farm incomes low, the production forces would be weakened, because under such conditions farmers would purchase less labor, fertilizer, and machinery. But they would continue many recently adopted improved practices, especially those that mean a lower cost as well as an increased volume of production.

Moreover, farmers must often maximize their production in order to meet their high fixed costs, even if prices fall. Farmers did so in the depression years 1930-33. Once the level of farm production has increased, it tends to remain high; it is relatively unresponsive to price declines. After the farm investment has been made, it tends to be used, almost regardless of changes in the price level; this applies to equipment and machinery, as well as to land. Farm productivity will unquestionably have great momentum in postwar years.

Expanded farm production in the United States will tend to remain high, and in important products will exceed the domestic demand at re-

munerative prices, even with employment and business active. A high rate of consumption at home and abroad will have to be maintained or else farm production will have to be reduced. Export outlets are essential. Moreover, the export trade will have to be built up again from practically zero; under war conditions commercial farm exports are down to a very low level. Temporarily, in addition to revived exportation of the staples, the United States may want to export certain things, such as dairy products and eggs, which previously it did not send abroad to any great extent. Farm production capacity has expanded, however, in other agricultural exporting countries, and also in England, an agricultural importing country. Eventually, though not perhaps in the immediate postwar years, the competition for world markets will be sharp. Vigorous worldwide expansion in economic activity would balance this growth in farm production capacity, except in a few important commodities such as wheat, rice, cotton, wool, and fats and oils. Getting such expansion is part of the world trade problem.

Preferably, agriculture's problem should be solved by measures to maintain and enlarge the world demand. The other way of getting supply and demand into balance, namely the way of downward crop adjustments, is not satisfactory. In the first place, agriculture cannot readily adjust its production downward; it has too high a proportion of fixed costs, too few crops among which to choose in each locality, and frequently considerable overmanning of the land. Secondly, crop curtailment is a scarcity program, which conflicts with basic human needs. In serious crises resort to curtailment may be unavoidable. But the United Nations are trying to develop means of sustaining and raising the level of economic activity, so that consumption will increase and make general crop curtailment either needless or merely occasional, moderate, and temporary. Here is the master key to greater and better world trade.

Food Conditions Abroad.—In most other countries lessened food production, combined with transportation difficulties and with some tendency for food-collection systems to break down threatens widespread hardship and suffering. As usual in the aftermath of war, the towns and cities will suffer most. This is a result not only of the fact that country people have the first chance to satisfy their food wants, but also of the fact that war disrupts trade between town and country. Farmers may have more food than they need themselves, and yet be unwilling to part with it for what they can get in exchange. Action to move food from surplus countries and areas to deficit countries and areas will be indispensable, if actual starvation is not to occur in many urban centers. Cereals, fats, and sugar are the most urgently needed products.

Food conditions will be below normal in the Orient as well as in Europe. Production will be low, not only in the areas formerly occupied by the Japanese, but also in Japan. Food output in Japan has declined nearly as much as in continental Europe. Japan, like continental Europe, is partly dependent on outside food supplies—in prewar years it depended more on food imports than continental Europe did. As in Europe, the food crisis in the Orient comes from shortages of fertilizers, draft power, and manpower and from a breakdown of normal trade. Rice production, for example, is much below prewar in the surplus-producing areas of southeastern Asia as

a result partly of the above-mentioned shortages and partly of the loss of outside markets.

Total 1945-46 world output of food in calories may be about 3 per cent less than the prewar average. Considering what the world has been through, this looks like a small reduction. But allowance must be made for population growth. On a per capita basis, the 1945-46 world food production may be 10 per cent below prewar, or enough lower to make a very serious food situation apart from other difficulties. Moreover, the international distribution will be very unequal; some countries, notably those of the Western Hemisphere, will have more food than they had before the war, but others will have much less. World stocks of many durable foods, such as rice, fats and oils, and sugar, will be extremely low. Even wheat, though available in a quantity above the prewar average, will be in smaller supply than during the war years.

These and other outstanding facts about the world food situation appear in a survey recently completed by the Office of Foreign Agricultural Relations, U. S. Department of Agriculture. The survey was based on regular agricultural reports from foreign governments, on special reports sent by United States officials stationed abroad, and on information collected by United States officials who traveled widely. Food production has declined most in continental Europe, (not including the USSR) and North Africa, partly as a result of drought in these regions, along with difficulties caused by the war. Probably the output in continental Europe and North Africa combined will be as much as 15 per cent below that of 1943-44, and as much as 25 per cent below the prewar average. Food actually available for consumption has declined somewhat less than the production, because of rigid economies in food utilization such as a higher cereal extraction rate in flour milling.

Allied Nations Contributions to War Food Supply.

—The seriousness of the world food situation has focused attention on the extent to which the Allied nations have severally contributed to the food supply needed to win the war. It is now possible, since restrictions upon publication of production and trade statistics have been relaxed, to answer this question and also some related questions, such as: (1) To what extent have the Allied nations expanded their exports of food? (2) How have United States food exports during the Second World War compared with those of the First World War? (3) Where have these food exports gone?

From 1942 through 1944 production trends and food exports of the Allied nations varied widely. Some countries were better able to expand their food production than others, and the shortage of shipping necessitated obtaining as much food as possible from countries nearest the critical war areas. These factors, plus unusually good weather for production in North America, resulted in large expansion in food production and also in exports from the United States and from Canada.

Nevertheless, the United Kingdom was highest in the percentage increase in food production. The United States was second. The British food production increase—66 per cent for the three years 1942, 1943, and 1944 over the 1935-39 period—resulted from an increase in the cultivated acreage of about 50 per cent, the conversion of much cultivated acreage to food crops, and great restriction of the meat and egg output.

Great Britain's emphasis on domestic produc-

tion of food reduced greatly the amount of shipping space required for its food imports, but made the British more dependent upon foreign meat and eggs. In consequence the need for expanded production of meat and eggs in food exporting countries, especially the United States, was increased.

The food production increase in the United States for the three years, on a calorie basis, was 36 per cent over the 1935-39 period. In Canada, third in expanded food production, the corresponding increase was 30 per cent.

Production of food in 11 important food exporting and importing countries during 1942-44 is shown below, as a percentage of prewar years. These percentages were computed from the caloric value of the different food products at the farm. This means was used to obtain aggregates of total production in each country because it provides a uniform method of comparison for the several countries.

The percentages obtained by this method, however, differ slightly from those which would be obtained if production were weighted by average prices in each country. For example, in the United States the aggregate output in food products in 1944, weighted by farm prices, was 138 per cent of the 1935-39 average; whereas weighting by calories gives a percentage of 142. All other parts of this article observe the farm price weighting method.

ALLIED NATIONS: FOOD PRODUCTION IN SELECTED COUNTRIES, 1942-44, AS PER CENT OF PREWAR AVERAGE (1935-39 = 100)

Country	Production ¹		
	1942	1943	1944 ²
	Per cent	Per cent	Per cent
United Kingdom	158	172	168
United States	133	132	142
Canada	168	93	130
Brazil	127	130	116
Chile	105	112	114
New Zealand	111	103	108
India	100	113	102
Uruguay	100	120	101
Egypt	103	97	100
Argentina	104	125	96
Australia	102	83	68

Office of Foreign Agricultural Relations.

¹ Farm output of food products weighted by calories, from a study of "Wartime Changes in Food Production," Office of Foreign Agricultural Relations, December 1944.

² Preliminary.

Consideration of the quantities of food supplies by the various Allied countries to the war effort must allow for their relative productive capacity and for the amounts of food they had available after meeting their domestic needs.

Naturally, for instance, New Zealand with less than 2,000,000 population could not supply as much food as the United States with 135,000,000 population. On the other hand, New Zealand normally exports a large proportion of its food production, whereas nearly all the food normally produced in the United States is consumed domestically. Hence the food supplied *per capita* from New Zealand for the war effort should be greater than from the United States.

It was relatively easy for the United States, from a percentage standpoint, to increase its food exports in the three years 1942-44 over the small prewar export level and at the same time to provide larger military and civilian food supplies. But for New Zealand to have increased its exports by even a small percentage would have

been extremely difficult and would have required either a very large expansion in production, or a substantial reduction in New Zealand's consumption per capita.

The United States led in the volume of food exports in the three-year period: its shipments abroad amounted to 33 per cent of the total quantity shipped by 10 allied food exporting countries. Canada and Argentina were next with about 17 per cent each. The percentage valuation of New Zealand and Australian exports—about 9 per cent—was high, in view of the small populations of those countries and the further fact that Australia suffered from a devastating drought.

Changes in the food exports of the different Allied nations were much greater than the changes in their food production as the following table shows:

FOOD EXPORTS: FROM SELECTED ALLIED NATIONS, 1942-44 AS PER CENT OF PREWAR² AND AS PER CENT OF TOTAL

Country	Prewar	Value of exports ¹			Average 1942-1944	
		1942	1943	1944	Per cent of prewar	Per cent of total
		Million dollars			Per cent	Per cent
United States	212	638	950	931	395	33.0
Canada ³	217	288	415	529	189	16.2
Argentina	548	418	420	490	81	17.4
Brazil	230	168	174	195	78	7.1
Uruguay	58	38	49	40	73	1.7
Chile	10	8	8	8	78	.3
Australia	272	206	214	268	84	9.0
New Zealand	242	249	226	214	95	9.0
India	196	145	146	...	74	45.7
Egypt	24	16	14	...	62	4.6

¹ Official sources.

² Exports of each country valued at average 1935-39 prices of products exported by the United States; commodities not exported valued at United States import prices for same period.

Comparison of the Second World War exports with those of the First World War is possible only roughly. Exact measures are not available. The United States total food output expanded much more during the Second World War than it did during the First World War. From 1935-39 to 1944 the increase weighted by farm prices was about 38 per cent, whereas from 1909-13 to 1918 the increase was only about 16 per cent. Likewise the food exports of the United States increased more sharply in the Second World War. Yet the per capita supplies of food for civilians, after deducting exports and military needs, were greater during 1942-44 than in the First World War, and greater than in the prewar (1935-39) years. Shortages of some commodities developed but the aggregate supply for civilians was at a record high level. While United States exports of other essential foods increased sharply in the years 1942-44, exports of cereals, which were in abundant supply, declined.

In the prewar period, about half of the United States food export traffic was in the form of grain; and the wartime drop in grain exports has largely offset, especially in terms of calories, the increase in exports of dairy products, and fats and oils. Overseas shipments of meats, eggs, and dairy products before the Second World War were insignificant. Phenomenal percentage increase took place in the wartime exports of these commodities. Meat and egg exports in 1943 were 22 times as large as in the prewar period; the outflow of dairy products increased 35 times. Exports of fats and oils soared.

Wheat.—Conditions in the next year or two may keep wheat acreage in the United States at about what it is now. Stocks of wheat, and likewise those of other wheat-exporting countries,

have been reduced considerably. In the 1945-46 marketing year, world trade in wheat may absorb most of the remaining surpluses in the wheat exporting countries. The price of wheat in the United States in 1945 was the highest since 1925; it was considerably above that of any other exporting country.

Temporarily, the United States is exporting flour under subsidy, as authorized by section 32 of Public Law 320, 74th Congress, as amended. Also, some wheat grain was exported under subsidy. Subsequently, military and relief requirements increased the overseas requirement. These commitments may maintain export wheat demand through another year at least. Eventually, however, the export-subsidy authorization may have to be applied increasingly, since maintenance of a large wheat acreage for several years will necessarily raise surplus-disposal problems.

² Either 1934-35 to 1938-39 fiscal years or 1935-39 calendar years.

³ Includes value of feed grains exported mainly to the United States.

⁴ Based on a two-year average.

Federal legislation provides price-support loans to wheat farmers. Under the Agricultural Adjustment Act of 1938, as amended by the Stabilization Act of Oct. 2, 1942, loans are available to co-operating farmers at 90 per cent of parity on wheat harvested before the expiration of the two-year period beginning the first of January following the official proclamation that hostilities have ceased. There is a limiting condition. Such loans are available "provided producers have not disapproved marketing quotas."

Cotton.—Over many years the quantity of cotton, American and foreign combined, which moved in peacetime from producing countries into world trade approximated 13 million bales. In the war years the volume shrank to 4 million or less. Victory is now reopening world trade channels, but it does not automatically assure restoration of the world's trade in cotton. Markets for cotton abroad have suffered from physical injury to cotton mills and also from general impairment of the economic order. For example, America's allies have incurred debts that depress their standards of living and impede resumption of their purchases. Aggressor countries have brought ruin upon themselves and involved many other countries in disaster.

The relief total of cotton sent abroad will not be large. The United States, however, will undoubtedly lend funds abroad in considerable amounts, as it did after the last war. Such lending and other palliatives will help to restore markets; but, until former customers can build up their external purchasing power, the United States must expect them to restrict their imports of cotton and to make increased use of synthetic fibers.

This prospect emphasizes the gravity of the cotton supply situation. World stocks on Aug. 1,

1945, were close to 26 million bales, or more than a year's consumption at the current rate. The oncoming crop, added to their carry overs, will give cotton-producing countries more than 20 million bales for export, after they have allowed for all domestic requirements for consumption and working stocks. This is more than double and possibly three times the total world export trade that now seems probable in the current year.

Two important facts should be noted. First, before the war the United States held the bulk of the world cotton surplus; now every other exporting country of importance has an unprecedented surplus. Secondly, former efforts by the United States to uphold prices made it easy in some years for other countries to undersell the United States abroad; but America is now in a position, under the Surplus Property Disposal Act, to export cotton at competitive prices. By means of its export program and credits this country could get a very large share of the reduced world trade in cotton.

Temporarily, such a course would move part of the American surplus and discourage cotton production in other countries. But it would be a dubious procedure in the long run. For example, it would raise doubts as to the sincerity of America's efforts to resolve world difficulties through international co-operation.

The United States government has been quick to assure the governments of other nations that it seeks no unfair advantage and wishes only to offset its handicaps in the international market. These have partly resulted, it should be noted, from measures the United States has taken internally to improve cotton prices—measures that have benefited foreign as well as American cotton growers. Hence, while insisting upon the right to retain its domestic and export programs, it has offered to negotiate an arrangement with other countries by which they may be protected from untoward or unintended consequences. The arrangement would provide for an equitable sharing of the international trade and for concerted action in dealing with the surplus. Preliminary discussions are underway.

Feed Grains Problem.—Large supplies of feed grains and other feeds were on hand in the United States during the 1944-45 season, but the demand too was large—for feed, food, and industrial uses. In fact the demand exceeded the market supply, particularly for corn, throughout most of the feeding season. The disappearance was heavy, though not quite as heavy as in the two preceding seasons. Fewer hogs and chickens were on hand, but the rate of feeding per unit of livestock was about equal to the high rate of 1943-44. Moreover, the utilization of feed grain for food uses and industrial uses was greater than in the other war years, and greater than in most earlier years. Large quantities of feed grain went into the production of industrial alcohol.

In the 1945-46 feeding season the domestic supply of feed grains will be somewhat larger than it was in 1944-45, as a result chiefly of the 1945 large production. About the same number of livestock will be on farms. Consequently, the quantity of feed grains available per animal unit will be larger. This is a favorable development, because stocks of old-crop feed grain at the beginning of the 1945-46 season were much smaller than in prewar years. It is necessary to have increased reserves, against possible drought. Reserves of possibly 15 to 25 million tons of corn, oats, and barley need not be burdensome.

Postwar handling of feed grains poses problems sharply different from those presented by the great export crops. Agriculture produces feed grains, principally corn, feed-wheat, barley, oats, and grain sorghums, for its own use, either on the farms that grow these crops, or on farms and ranches whose operators purchase feed supplies. In other words, the market is domestic. This is also true to a considerable extent of the livestock that consume the grains, with hogs a partial exception. Hence in this connection, the difference between domestic and world prices is not vitally important; it does not suggest the use either of any two-price system, or of any program to make American feed grain prices fully competitive in world markets. National policy for feed grains must chiefly consider domestic requirements.

Dairying.—Transition from war to peace in dairying makes necessary the reversal of the policy of limiting domestic utilization of dairy products to one of stimulating civilian consumption. During the war the manufacture or distribution of every major dairy product was subject to controls designed to limit civilian consumption and make adequate supplies available for military and associated war uses. These limitations were necessary despite substantial increases in milk production. The increased production must be absorbed in civilian outlets as the war-time requirements are reduced. History has demonstrated that rapid contraction of milk production is not feasible. Moreover, from a nutritional standpoint maintenance of milk production is desirable.

With the advent of V-J Day near the end of the flush production season, the shift of milk from wartime utilization to domestic civilian use is being undertaken promptly. Military and other government agencies procuring dairy products maintained a policy of securing most of their annual requirements during the period of flush production. By acquiring sufficient stocks during spring and summer to tide war agencies over the winter, alternate periods of feast and famine in civilian distribution were avoided. Thus, stocks of dairy products held by or set aside for military agencies when war ended were sufficient and in some instances more than sufficient to feed the reduced personnel expected in the armed forces.

Meat Animals and Meats.—In meats the situation became extremely tight in 1945. Civilian consumption in the United States declined from the high level of 150 pounds per capita (wholesale weight) in 1944 to 125-130 pounds, approximately the same as under the 1935-39 average of 126 pounds per capita. Consumer purchasing power in 1945 was much greater than prewar. At prevailing prices, the supply of meat for civilians was only about three fourths as great as the potential demand. The shortage was accentuated by shortages of other foods, particularly poultry. Basically, the civilian meat shortage in 1945 was the result of reduced production of pork and of increased military needs.

Total meat production was nearly 2,000,000,000 pounds smaller than the record production of 24,600,000,000 pounds in 1944; yet it was over 6,000,000,000 pounds more than the average annual production of 16,200,000,000 pounds in the period 1935-39. Production of beef was moderately greater than in 1944; production of veal and of lamb was slightly less; pork production was 20 per cent less.

Fats and Oils.—The supplies of fats and oils

available for United States civilians in 1945 have been the smallest for many years. Several factors have contributed to this reduced supply, such as decreased quantity of lard, smaller supply of flaxseed, decreased imports, and substantial exports to Allied and liberated countries. During most of the year, rationing of edible fats and oils for civilians and industrial quotas to manufacturers was at the lowest level of the war.

The Second World War forcibly brought attention to the dependence of the United States on foreign countries for imports and exports of fats, oils, and oilseeds. Prior to the war, imports ranged from 1.5 to 2.5 billion pounds of fats and oils annually and represented 15 to 25 per cent of total consumption. With the Japanese occupation of the Pacific Islands, which were the principal sources of our imports, and the increased domestic demand created by the war industries, the United States supply situation became critical. Since the United Kingdom and the Soviet Union were also faced with desperate shortages of fats and oils, it became necessary for the United States to share its inadequate supplies with them.

To meet the acute situation, the United States government early in the war undertook several measures to stimulate greater production, such as paying a premium for heavy hogs and guaranteeing prices for vegetable oilseed crops. With the splendid co-operation of farmers and favorable weather, notable results were achieved during the past four years. Production of oils and fats in 1943 and 1944 reached an all-time high of nearly 11 billion pounds, about 3 billion pounds or 35 per cent above that of 1939. Production of vegetable oils from domestically grown soybeans, flaxseed, cottonseed, and peanuts during the past three years has been 75 per cent greater than in 1939. Total production in 1945 declined to below 10 billion pounds due to the sharp decrease in animal fat production.

The maintenance of the high level of vegetable oil production in the United States is a problem that warrants timely attention. The liberation of Europe created an unusual demand for fats and oils. Continental Europe, excluding Russia, has been the world's largest fats and oils consuming and importing area. Prewar consumption of both edible and inedible fats and oils amounted to about 14 billion pounds annually, of which 4 billion were imported. In the war years, European production of animal fats, which formerly accounted for about two thirds of the total, was materially reduced, owing to a shortage of livestock feed. Several liberated countries which were required to expand vegetable oilseed production under German control will continue to emphasize oilseed crops. Import requirements, however, will remain large. If world prices do not advance above present levels, available world supplies are likely to be inadequate to fulfill requirements in 1946. Even though hostilities have ended in the Pacific, new supplies available for Europe and the Western Hemisphere have thus far proved disappointingly small. Only moderate supplies will be available by the middle of 1946 and a longer period will be required before copra, palm oil, and soybeans will again be available in the prewar volume.

Poultry and Eggs.—During 1945 the poultry and egg industry experienced extremes of possible production and marketing conditions. At the beginning of fiscal 1945 it was just overcoming a surplus condition. The United States government was then purchasing large quantities

of dried eggs not only for lend-lease purposes, but also as a means of supporting egg prices. It was purchasing shell eggs as an additional means of supporting prices. By October 1944, however, the surplus had substantially disappeared. Egg prices became firm in late November of 1944. Since then they have been practically at ceiling levels continuously, though a temporary decline occurred in September and early October of 1945.

Egg shortages were somewhat acute during most of 1945; they resulted largely from shortages that prevailed simultaneously in the supply of meats for civilians. In April, May, and June, egg prices rose substantially above the ceilings in many areas. Civilian consumption of eggs for 1945 may run close to 400 per capita as compared with 351 in 1944. Considerable substitution of eggs for meat occurred in all areas with the result that even in the midwestern surplus production area the supplies of eggs were far from being ample. In fact, war agencies were unable to procure their full requirements during the months of peak production. Nevertheless, through an extended use of priorities, the procurement program for shell eggs was about on schedule at the end of the fiscal year. However, the procurement of dried and frozen eggs was behind schedule.

Tobacco.—Tobacco had its peak year of war during 1944–45. Few other agricultural commodities, particularly nonfood items, contributed so large a proportion of production to strictly military use. The high rank with consumers was forcefully demonstrated by the record level of production, the huge volume of products taken for the armed forces, the turbulence of civilian efforts to obtain cigarettes and the heavy movements of leaf tobacco to those countries again able to ship stocks from the United States.

Despite an increase above the previous high record for 1943–44 of around 7 per cent in leaf tobacco usage and factory output, insufficient tobacco products were available during a part of the year to supply the increasingly large demand for civilians. The level of production was more than 50 per cent above the 1935–39 average and taxed manufacturers to capacity.

The manufacture of all kinds of tobacco products during 1944–45 increased over 1943–44. Cigarettes which amounted to nearly 80 per cent of the total volume of tobacco products increased about 7 per cent, smoking tobacco gained nearly 17 per cent, chewing tobacco and snuff went up about 2 per cent and cigars gained also. Consumer preference for cigarettes continued to dominate. The substantial increase in smoking tobacco may be attributed in large part to consumption by smokers unable to buy cigarettes. Cigar production likely would have been higher if manufacturers had been able to obtain more factory labor. The upward trend in output of higher priced cigars continued.

The Commodity Credit Corporation continued to handle most of the purchases for export, consisting of the requirements for the United Kingdom and its dominions and colonies. Small quantities were moved into export through regular commercial channels. About two thirds of the deliveries to the British were for cash and the remaining third for strictly military use was under lend-lease. With the termination of lend-lease following V-J Day, all deliveries have been paid for in cash by the British. The willingness to use dollar exchange for purchases of this commodity and the continuation of large require-

ments following the close of hostilities place tobacco near the top of the list of items eagerly sought by the British Empire countries.

During the war period, 1939 to 1945, the Commodity Credit Corporation handled approximately 1,700,000,000 pounds of tobacco primarily for use by America's fighting allies. About one half of this quantity was shipped under lend-lease and half was sold for cash.

Farm Income in 1945.—Cash receipts from farm marketings in the United States in 1945 may total about \$20,400,000,000—3 per cent more than in 1944. The income from crops is expected to be 5 to 10 per cent above 1944. On the other hand, the income from livestock and livestock products will reflect decreased sales, particularly in hogs.

In volume the marketings (crops and livestock combined) will be about the same as the record total of 1944. It will include, however, an unusually large proportion of crops from the previous year's harvests. Comparatively heavy marketing of 1944 crops in 1945 resulted from several factors, notably the late maturity of 1944 cotton, the high moisture content of much 1944 corn, the shortage of rail transportation, and administrative orders that delayed tobacco marketings.

Total marketings of crops in 1945 were about 7 per cent greater than those of 1944, while marketings of livestock and livestock products were smaller by about the same percentage.

Prices received by farmers in 1945 may average about 2 per cent higher than in 1944. Livestock and livestock products will show a greater gain than crops.

Cash receipts from crops showed consistent monthly gains over 1944 up to and through September 1945, especially in the receipts from feed grains. Corn returned a higher income than in 1944; the receipts from oats rose sharply, because of the large 1945 crop. Income from wheat increased owing to the sale of parts of two record crops at relatively high prices. Income from vegetables increased substantially; truck crops prices during June, July, and August showed greater gains over 1944 than any other group of prices.

Cash receipts from livestock and livestock products increased only slightly. Despite a small percentage gain in hog prices, income from hog marketings declined sharply, as a result of drastically reduced sales. On the other hand, income from cattle and calves was higher than in 1944, because marketings were about the same while prices were up slightly. Poultry and eggs returned an increased income, mainly as a result of higher prices. Dairy products earned slightly more income for farmers as a result of slightly larger production.

Net returns to farmers reflect production expenses as well as cash receipts. Total expenses of farm production for 1945 may be 4 per cent above those of 1944, with increases relatively large in labor costs and in maintenance and depreciation. Wage rates were up about 8 per cent, and the value of perquisites to hired workers was up slightly, in line with the higher value of farm products. The total costs of hired labor in agriculture, for wages and perquisites, seemed likely to be about 7 per cent higher than in 1944. Expenditures for purchased feed declined.

Charges for maintenance and depreciation increased partly because farmers had more opportunity to replace outworn and outmoded equipment. Expenses of maintenance and deprecia-

tion may be from 5 to 10 per cent above 1944. Farmers are eager to replace old equipment, and also to buy fertilizer and lime in increased quantities as supplies become available.

Taxes and mortgage interest showed little change from 1944. Local tax assessments have shown little change throughout the war period, while farm indebtedness has decreased.

Analysis of the receipts and the expenditures indicates the net income to operators in 1945 may be about 3 per cent higher than in 1944. Value of products consumed in farm homes may be slightly higher; the rental value of operators' dwellings may show a small increase, in line with some rise that has taken place in real estate values; government payments will be about the same as last year. ALABAMA, East South Central state, United States; admitted to the Union Dec. 14, 1819. Population (1940): rural, 1,977,020; urban, 855,941; total, 2,832,961. Land area, 51,078 square miles divided into 67 counties. Principal cities, with 1940 population: Birmingham, 267,583; Mobile, 78,720; Montgomery, the capital, 78,084; Gadsden, 36,975.

Chief State Officers, 1945.—Governor, Chauncey Sparks; lieutenant governor, L. Handy Ellis; secretary of state, Miss Sibyl Pool; treasurer, Walter C. Lusk; comptroller, I. C. Heck; attorney general, Robert Harwood.

Judiciary.—Chief justice, Alabama Supreme Court, Lucien D. Gardner; associate justices, William H. Thomas, Robert I. Simpson, Joel B. Brown, Arthur B. Foster, J. Ed Livingston, Thomas S. Lawson.

Legislature.—The state legislature (Senate, 35 members; House of Representatives, 106) convenes biennially in odd years on the first Tuesday in May.

Education.—Public elementary school teachers (1943-44)¹, 12,599; pupils, 451,984; average yearly salary of elementary school teachers, \$854. Public high school teachers (1943-44) 6,839; students, 195,570; average yearly salary of high school teachers, \$1,202. Education in Alabama is compulsory for children between the ages of 7 and 16, inclusive. There are five teacher training schools in the state, including one for Negroes. Total state appropriation for education in 1944, \$24,251,570; appropriation by cities and counties, \$9,969,747. State Superintendent of education, E. B. Norton.

Finances.—The following statement of Alabama's finances for the fiscal year 1944-45 was furnished by Walter C. Lusk, state treasurer:

Balance in treasury, beginning of fiscal year 1944-45	\$ 43,095,979.77
Receipts, 1944-45	194,415,214.41
Total	\$237,511,194.18
Disbursements, 1944-45	179,961,827.66
Balance, beginning of fiscal year 1945-46	\$ 57,549,366.52

¹ Latest school year reported.

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1, estimates of the 1945 crops, are shown in the following table:

Crop (and unit of production)	Production		Pre- liminary 1945
	Average 1934-43	Final 1944	
Corn (1,000 bus.).....	45,310	48,128	47,157
Oats (1,000 bus.).....	2,729	4,608	5,064
Cotton (1,000 bales)....	1,010	1,006	940
Hay, tame (1,000 tons)...	699	716	752
Peanuts (1,000 lbs.)....	238,682	327,600	332,050
Sweet potatoes (1,000 bus.)	6,548	6,699	5,865
Potatoes (1,000 bus.)....	4,131	3,364	5,300
Peaches (1,000 bus.)....	1,463	1,380	2,440
Pears (1,000 bus.).....	291	312	416
Grapes (tons).....	1,280	1,200	1,500

ALAND, Åland, ISLANDS. A group of about 300 (80 inhabited) islands and islets between the Gulf of Bothnia and the Baltic Sea, and near the mouth of the Gulf of Finland, composing a department of Finland; area, 551 square miles; population, 27,375; capital, Mariehamn. Åland is the largest island in the group, others being Lemland, Lumparland, Ekerö, Foglö, Kumlinge, Brändö, Vårdö, and Hangö. The harbor of Åland is capable of accommodating a large fleet. Chief towns are Åland and Castelholm. Strategically the islands are of great importance, since, properly fortified, they form a barrier between the Baltic and the Gulf of Bothnia and provide a naval base commanding the entrance to the Gulf of Finland. According to the North Sea Baltic Treaty of 1908, they were not to be fortified or used for military or naval purposes. They were nevertheless fortified by Finland. An agreement between Finland and the Soviet Union to demilitarize the island was signed on Oct. 11, 1940. This agreement went by the board when Finland joined Germany in the war against Russia in June 1941, and the islands were occupied by Finnish troops on June 23, 1941. However, the armistice signed by Russia and Finland in September 1944 reinstated the agreement in the following words: "The validity of the agreement on the Åland Islands, concluded between Finland and the Soviet Union Oct. 11, 1940, is fully restored." In January 1945 the islanders threatened secession, indignant at published reports that Finland had offered bases in the islands to Russia the previous fall in lieu of ceding the Porkkala district. Both Russia and Sweden opposed the separatist movement.

ALASKA. Discovered by Vitus Bering and Alexi Chirikof in 1741 and purchased from Russia by the United States of America for \$7,200,000 in 1867, Alaska is one of the two duly constituted territories of the United States. It lies between the meridians of 130 degrees west and 172 degrees east longitude and between the parallels 54 degrees and 72 degrees north latitude. It has an area of 586,400 square miles and a civilian population of 72,524 by the 1940 census. As a result of wartime activities the population is now estimated at 100,000. The capital is Juneau, and other chief cities are Ketchikan, Wrangell, Petersburg, Anchorage, Fairbanks, and Nome. After its purchase from Russia it was first governed by the United States Army. Later it was created into a district, and in 1912 was given a territorial form of government under the Organic Act.

Government.—Alaska's new enlarged legislature met for the first time in 1945. Under the provisions of the amended Organic Act of 1912, Alaska had for the first time a cross-section repre-

sentation in its House of Representatives as a result of representatives being elected on an apportionment of population basis, giving eight representatives to the First Judicial Division, seven to the Third Judicial Division, five to the Fourth Judicial Division and four to the Second Judicial Division. Its Senate, or upper house, was enlarged to give four senators from each of the four judicial divisions. Under this plan of giving greater representation to smaller communities, the legislature enacted laws pointing toward the development of the territory in the postwar period. It enacted for the first time an anti-discrimination law, being the first territory or state of the United States to enact such a law. It created an Alaskan Development Board which is now functioning, the purpose of which is to assist in guiding the way toward development of industry, commerce and transportation in conjunction with the federal government. It created for the first time in the territory a Department of Agriculture with the aim of working out an agricultural program in the territory and developing and settling potential agricultural lands. Extending the franchise to its younger citizens, it lowered the voting age to 18 years, subject to validation by Congress.

The Organic Act which creates a legislature for Alaska also provides for a delegate from Alaska to the Congress with a seat in the House of Representatives, but without vote. He is elected by the voters at large in Alaska for a term of two years. The present delegate is Edward L. Bartlett.

The territorial legislature is one branch of Alaska's government. It creates various territorial offices and appropriates for their upkeep. Territorial offices created and officials elected by the voters at large are: auditor, Frank A. Boyle; treasurer, Oscar G. Olson; attorney general, Ralph J. Rivers; highway engineer, W. Leonard Smith. Its total appropriation for the next biennium, April 1, 1945, to March 31, 1947, is \$5,631,822.

The other branch of Alaska's government is federal. Under the federal government, the governor of Alaska is appointed by the president of the United States subject to confirmation by the United States Senate. The present governor is Ernest Gruening who has served since Dec. 6, 1939. The secretary of Alaska, who acts as governor in the absence of the chief executive, is also appointed by the president subject to confirmation by the Senate. The present secretary is Llewellyn M. Williams.

Judiciary.—All courts of the territory are under federal jurisdiction with one judge appointed by the president in each of the four judicial divisions. The judges appoint United States commissioners who act as lower court magistrates, probate judges, coroners and recorders. The United States marshals, one in each of the four divisions, are responsible for the maintenance of law and order outside of incorporated towns. Officials appointed by the governor, subject to approval by the legislature are the commissioner of education, commissioner of mines, commissioner of health, director of the department of public welfare, superintendent of the pioneers' home, director of the unemployment compensation commission, adjutant general, curator of the Alaska Historical Library and Museum and supervisor of the Alaska Aeronautics and Communication Commission.

Finances.—The territory has no public debt of any kind. Territorial taxes are levied by the legislature and federal agencies are supported by ap-

propriations from the Congress of the United States.

In the territory taxes are levied on mining, 3 per cent on the gross, plus a graduated net tax; on canned salmon, a pack case tax; a business license tax on industries, trade, businesses, and occupations, an excise tax on alcoholic liquors, and a one-cent per gallon tax on motor fuel.

Following is a statement of Alaska's finances for the fiscal year 1944-45, supplied by Oscar G. Olson, territorial treasurer:

Balance in treasury, beginning of fiscal year 1944-45	\$ 930,063.85
Receipts, 1944-45	3,153,103.65
Total	\$4,083,167.50
Disbursements, 1944-45	3,227,280.44
Balance, beginning of fiscal year Jan. 1, 1945	\$ 855,887.06

Mining and Minerals.—With the cessation of hostilities, much military and naval construction work which had been going on during the war years ceased and Alaska began the major task of reconversion. Mining, which had been dormant since 1942, was beginning to show signs of revival. Plans were being made for the reopening of old properties in the spring of 1946 and the exploration and development of new potential fields. Although the war had ended the navy was still drilling for oil in the great naval reserve near Point Barrow, farthestmost north settlement in North America.

Fishing Industry.—The fishing industry produced approximately 4,500,000 cases of salmon during the 1945 season. This was approximately one half million cases below the previous year due to a poor run of pink salmon in Southeast Alaska. Between 40 and 50 million pounds of halibut were taken from Alaskan waters during the year. Fur seals were taken from the Pribilofs, under government supervision, which had an estimated value of approximately \$1,000,000. Other furs, such as mink, otter, fox, ermine, and marten were taken in large numbers. The average annual fur take in Alaska, aside from fur seals, is valued at \$2,000,000.

Communications.—As a result, in part, of the war and coupled with a vast expansion program of the Civil Aeronautics Authority, one of Alaska's major means of transportation is air. In addition to being on two projected around the world routes, a large number of private companies operate within the territory, serving every community the length and breadth of the territory. A large part of the mail service in Alaska is by air. In addition to air, three steamship companies operate to the territory from Seattle, and two lines from Vancouver, British Columbia. The Alaska Railroad, operating from Seward to Fairbanks, serves a large area in the central part of the territory. This railroad is government owned and has headquarters in Anchorage. A system of highways also is in operation in interior Alaska connecting some of the major towns and leading to the eastern boundary of Alaska where it connects with the Alaska Military Highway, going from the territory to Edmonton, Canada, thence to continental United States.

The Alaska Communications System, operated by the United States Army, furnishes the territory with telegraphic service. This is supplemented by service of the Alaska Aeronautics and Communication Commission which particularly aids airplane traffic. In addition, interior Alaska towns have direct telephone communication over an army line leading to continental United States along the Alaska Military Highway.

Education.—Schools, within incorporated cities and incorporated school districts, and rural schools are provided for Alaska's children, for whom education is compulsory between the ages of 7 and 16, inclusive. In the 1944-45 school year, there were 55 public elementary schools in operation, employing 203 teachers and enrolling 4,636 pupils. Public senior high schools numbered 22, with 117 teachers and a student enrollment of 1,158. Elementary school teachers received an average yearly salary of \$2,412; senior high school teachers, \$2,439. Additional educational facilities for native children are provided by the Alaska Native Service, Department of the Interior. The University of Alaska, located at College, Alaska, near Fairbanks, offers four-year courses in agriculture, arts and letters, business administration, chemistry, civil engineering, education, general science, home economics, mining, and pre-medicine. The total territorial appropriation for education in 1944-45 amounted to \$926,605.69; the appropriation by cities (1943-44) was \$248,737.34 (exclusive of capital outlays). James C. Ryan is Alaska's commissioner of education.

Forests.—Alaska has two large national forests. The Chugach National Forest is located in the Prince William Sound region and Kenai Peninsula, and Tongass National Forest covers most of Southeast Alaska. Their combined area is 20,850,000 acres. Timber from these forests may be purchased and removed for use by local industries and individuals under forest regulations.

Fur Farming and Agriculture.—The fur farm acreage in Alaska, some of which is within the national forests, is 1,042,253. Farm lands comprise 1,775,752 acres and the acreage for general farming, fur farming and grazing is 66,296,000. Value of farm property including land and buildings is estimated at \$3,841,045.

LEW M. WILLIAMS,
Acting Governor, Territory of Alaska.

ALBANIA (officially Shqipëria). A territory on the west coast of the Balkan Peninsula, bounded on the north and east by Yugoslavia, and south-east to the Adriatic Sea by Greece. Declared independent in 1912, Albania included the old Turkish provinces of Scutari, Yanina, Kossovo, and Monastir. During the subsequent period the state underwent many changes, becoming in turn a nominal principality, a republic, a parliamentary monarchy, an Italian protectorate, and a center of guerrilla resistance to the Axis until the German collapse in the spring of 1945. Area, 10,629 square miles; population (census of May 25, 1930), 1,003,124; chief towns: Tirané (Tirana), the capital, 30,806; Shkodër (Scutari), 29,209; Korçë (Koritsa, Cortcha), 22,787; Elbasan, 13,796; Argyrokastron (Gjinokastër, Argyrokaströ), 10,836; Berat (Berati), 10,403; Vlora (Vlorë, Valona), 9,100; Durrës (Durazzo), 8,739. In 1941 the districts of Ciamura in Greece and Kossovo in Yugoslavia were annexed to Albania under Axis auspices. The population is made up of two ethnic stocks—the Ghegs, in northern Albania, and the Tosks in the south. About 92 per cent of the people are Albanian, with a certain mixture of Vlach, especially in the Epirus region, 4.7 per cent Greeks, and 3.1 per cent other nationals.

Religion and Education.—Some 69 per cent of the total population are Muslims; about 10 per cent, chiefly in the north, are Roman Catholic, while 21 per cent, chiefly in the south, belong to the Albanian Orthodox Church. Primary education was compulsory under King Zog's rule but

not always enforced, owing to the lack of schools and teachers. Prior to the outbreak of hostilities between Italy and Greece in October 1940, state primary schools numbered 663, with 1,302 teachers, 38,988 boy pupils and 17,948 girl pupils, 18 intermediate schools for boys with 4,810 pupils and 256 teachers and 1 intermediate school for girls with 1,425 pupils and 37 teachers. There were also 22 infant schools with 40 women teachers, 1,229 boys and 1,206 girls.

Economic Conditions.—The annual budget of Albania under normal conditions was approximately \$8,000,000. The income was hardly sufficient to meet the cost of administration and the rudimentary organization of public services. Economic development was possible only with the aid of foreign capital. The Albanian government tried to solve this need by entrusting, in March 1925, to an Italian financial group, the foundation of the Albanian National Bank and of the corporation for the economic development of Albania. In fact, until the outbreak of the Greek-Italian war in 1940, Rome appropriated funds for extensive economic improvements. The country is mountainous and frequently wild, making cultivation difficult. The Albanians are almost entirely dependent on their land, carrying on a characteristic combination of pastoral and agricultural occupations. Agriculture is in the first phase of development. The leading products are cheese, fish, olives, grains, eggs, skins, wool, tobacco, livestock and timber. Goats are reared, but the cattle are of poor breeds, yielding little. Oxen, with buffaloes in the swampy plains, are used for ploughing. Religion forbids the keeping of pigs, save among the Christian tribes. There are a few small domestic industries of which cotton manufacturing is the most important. Wool spinning and cigarette manufacturing are also carried on locally, the heavy wool native cloth being largely exported in peacetime. The country possesses important forests, the principal woods being walnut, chestnut, oak, pine, fir and beech. Little is known of the mineral wealth. Almost the whole strip of coastline, about 60 kilometers in width, shows indications of the presence of hydro-carbon. Asphalt and bitumen springs are worked at Selenitza, near Valona. Petroleum concessions were granted to the Anglo-Persian Oil Company, the Italian state, and the French Credit des Petroles. Coal seems to exist in the regions of Tepeleni, Orica and Tiranë, and there is iron in the basin of Fandi, near Scutari, and in the Tepeleni district.

Transportation.—The principal towns are connected by roads, some suitable for motor vehicles. In the mountain districts, however, communication is mostly by means of pack horses. The total length of roads at the end of 1941 was approximately 1,760 miles. The country's first railroad, between Durrës (Durazzo) and Elbasan, was begun in May 1940. Motorboats are used on Lake Ochrida and Lake Butrinto.

Principal Events.—To the accompaniment of a 21-gun salute and dancing and singing in the streets, the new Albanian government entered the liberated capital of Tirana on Dec. 2, 1944, on the 32d anniversary of the Albanian independence. Col. Gen. Enver Hoxha, who headed both the Partisan Army and the government as premier, pledged the establishment of a democratic form of government, private ownership of property, universal suffrage, national mobilization of labor to rebuild the devastated country, and punishment of war criminals. Discussing a recent statement by Greek Premier George Papandreu

that Greece would seek a portion of southern Albania (Epirus) in postwar settlements, Hoxha declared flatly that Albania was ready to fight to protect her borders. This former professor of French also went on record as favoring a "close alliance" with Tito's Yugoslavia to which Albania was now bound by "ties of blood." But there was some underground opposition to Hoxha, demanding the return of King Zog from exile, who declared from London in January that he would approve creation of a regency if and when a proposal were made. In mid-December, Hoxha conferred at Tirana with a Soviet mission. The "Albanian Tito's" right-hand-man, Mehmet Shehu, at this time made it clear that he was not only anti-British but that he sympathized wholeheartedly with the Greek ELAS (National Popular Liberation Army); this attitude was further confirmed when Albanians, as well as Bulgarians, filtered into Greece to assist the ELAS faction and to form a free Macedonia. There were, on the other hand, many adherents of the ELAS cause who were at pains to explain the reports that Albanians (and Bulgarians) were entering Greece as part of a set propaganda scheme of the Greek government's purpose of blackening the ELAS name. Dr. Krok Kolaj, Albanian minister of justice, speaking for the Albanian national liberation organization movement (ANLA), promised in January to "punish all who have aided the foreign invader and attempted to obstruct our sacred war"; a special trial court was to be formed in Albanian prefectures or subprefectures, each court to include, in addition to one "regular career judge," two officers of the local ANLA council, an ANLA member, one member of the ANLA women's council and one delegate from the ANLA youth organization. In February, Don Lazar Shatoja, who had collaborated in the coup that overthrew King Zog and "later helped in charting Fascist plans to invade Albania," and Sulce Beg Bushati, the "most hated traitor" in his province who tried to mobilize troops for Italy in the war against Yugoslavia and who had "co-operated with the Gestapo and killed and robbed," were condemned as war criminals and shot in Tirana. In February, declaring that the meeting of the Big Three had been received "with great enthusiasm by the Albanian people," the Tirana radio said that in connection with the conference the "Albanian people raises its voice once again" asking that the government of Hoxha be recognized by the Allies. In April, Hoxha sent a letter to President Roosevelt, Prime Minister Churchill and Marshal Stalin, asking "on behalf of the government of democratic Albania" that the country be invited to participate in the San Francisco Conference. In the same month, the Athens radio charged the Albanians, most of whom are Mohammedans, with extensive persecution of the Orthodox Christian Greeks in the Koritza area of Albania adjacent to Greece. The broadcast claimed that "twenty-seven completely Christian villages were burned down and hundreds of inhabitants killed by the Turco-Albanians. Seven other Christian villages were also partly burned down and much of the Christian parts of twenty other villages were burned. The number killed is very considerable." On April 24, Dr. Laurence H. MacDaniels, who headed the agricultural division of the Albanian Commission of the United Nations Relief and Rehabilitation Administration, announced that the commission had been temporarily disbanded because of two principal "political difficulties": The UNRRA could operate only at the invitation of a recognized Albanian gov-

ernment, and the Partisan government of Hoxha was not so considered by the United States and Britain; and the Anglo-American military liaison organization that would have preceded the UNRRA's entry to help with distribution was "unacceptable to the Partisan government as so constituted." During the summer, the Greek sources kept up agitation for the incorporation of Northern Epirus into Greece, on both ethnological and moral grounds, "for the Epirotes themselves ardently desire such union with their Motherland." In July-August, the Athens newspapers published the text of the memorandum dealing with the "tragic" situation in Northern Epirus which the Foreign Affairs Committee submitted to the Greek government and a copy of which was sent to the Churchill government with an appeal that Epirus should be occupied by Allied troops, including Greek, pending a final decision by the Peace Conference on the fate of the region.

JOSEPH S. ROUCEK,
Hofstra College.

ALBERTA. A province of western Canada, 255,285 square miles in area (of which 6,485 square miles are water). Over half of the total population (estimated at 816,000 in 1945) is of British descent, others include Germans, Ukrainians, Scandinavians, French, and Poles. The capital is Edmonton (pop. 93,817), and other cities include Calgary (88,904), Lethbridge (14,612), and Medicine Hat (10,571). Executive power is vested in a lieutenant governor appointed by the Dominion government (John Campbell Bowen, March 20, 1937) and a nine-member executive council (Cabinet) of the Legislative Assembly, which has a membership of 57; at the general election on Aug. 8, 1944, the Social Credit Party increased its majority to 51, Ernest Charles Manning continuing as premier. The province is represented in the Dominion Parliament by six senators and 17 members of the House of Commons. Provincial government totaled 2,852 in 1944, the 1945 amounted to \$31,848,484, and expenditure was \$25,962,684, giving a surplus of \$5,885,800; the net general bonded debt stood at \$138,821,432. Schools conducted by the provincial government totaled 2,852 in 1944, the number of pupils being 151,985. The government also maintained the University of Alberta, with a faculty of education for training teachers at Calgary and Edmonton, and two schools of agriculture.

Agriculture and the raising of livestock have long been Alberta's principal occupations. Wheat is the leading crop (105,700,000 bushels in 1944), and ranking next in importance are oats, barley, rye, mixed grains, and flaxseed. Livestock in 1944 comprised 1,742,800 cattle, 2,278,900 swine, 1,023,200 sheep, and 603,500 horses. Lumbering is conducted on a considerable scale in the province's 12,393,500 acres of forests.

Alberta excels all other Canadian provinces in its abundance of nonmetallic minerals. The province produces about 90 per cent of the Dominion's total yield of petroleum (8,788,726 barrels in 1944) and about 80 per cent of its natural gas consumption (37,392,000M cubic feet in 1944); more than 75 per cent of Canada's coal reserves are within her borders (7,427,433 tons mined in 1944), and the province's deposits of bituminous sands are the greatest in the world. Salt is produced at McMurray (another mine at Vermilion is awaiting development), and sand, gravel and

clay at many places. Manufacturing industries, which have an annual production value of some \$250,000,000, are of increasing importance. Calgary and Edmonton are the chief industrial centers. Foodstuffs are manufactured, as well as cement, glass, linseed oil, metal and wooden products, and textiles. The net value of all classes of production in 1944 was \$521,428,820 (\$438,314,954 in 1943).

Railroads within the province have an aggregate length of 5,818 miles, and there are more than 7,000 miles of highways of all classes, 3,000 miles of which are gravelled and 500 hard surfaced. Air transportation facilities are good, numerous airports having been constructed during the war.

ALCOHOLIC BEVERAGES. See DISTILLED SPIRITS.

ALCOHOLS. See CHEMISTRY.

ALDERNEY. See CHANNEL ISLANDS.

ALEUTIAN ISLANDS. A chain of about 80 small islands belonging to Alaska Territory, extending nearly 1,600 miles from east to west between 172° E. and 163° W. longitude; area, 6,391 square miles; pop. (census of 1939) 1,298. Furs and fish are plentiful. On some of the islands there are grassy valleys suitable for cattle raising, and for the growing of turnips, potatoes and other hardy vegetables. As a by-product of war, thousands of trees have been planted on the originally treeless islands where the largest native plants are willows that reach a height of 8 feet on Unalaska, the site of Dutch Harbor at the eastern end of the chain, and 6 feet on Attu, the westernmost island. During the four years that Lieut. Gen. Simon Bolivar Buckner, Jr., (q.v.) was commanding general of the Alaska Defense Command, and later in command of the Alaska Department, he encouraged tree planting, and just before leaving Alaska for the campaign in which he met his death, he set up a specific program for tree planting in the Aleutians. Varieties of spruce, mountain hemlock, northern black cottonwood, balsam poplar, white and Kenai birch, aspen, alder, and willows have been planted. Of some 11,000 trees planted by the army in 1942, perhaps 5,000 are left on Kodiak and Umnak; while of the 3,000 planted in 1943 and 1944, nearly 1,000 are still alive, exclusive of the 1944 fall plantings. Whether the Aleutians will respond to afforestation is problematical. Soil conditions are not too unfavorable, but there may be climatic bars to successful growth in the insufficiency of a growing season, lack of enough summer sunshine, and excessive winds. Dr. Aleš Hrdlička, the anthropologist, in *The Aleutian and Commander Islands and their Inhabitants* (1945), declares that analysis of evidence shows that two types of people inhabited the islands, the earliest arriving there about the beginning of the Christian era. These pre-Aleuts were not Eskimo but "derived from the paleo-Asiatic complex of people." He believes them to be an offshoot of one of the Tungus tribes of northeastern Asia. The modern Aleuts, of entirely different skull formation, moved into the islands from the American side about 400 or 500 years before the coming of the Russians. On June 3, 1942 Japanese warships bombed Dutch Harbor, causing 93 casualties; they also landed troops on Agattu, Kiska and Attu islands. United States Army and Navy forces attacked the invaders. On May 11, 1943, American troops landed on Attu and in the course of a bitterly

fought battle drove the enemy to Chichagof Harbor where they made their last stand, losing 2,350 killed and only 24 captured. Attu was liberated on May 31. American and Canadian troops landing on Kiska on August 15 found that the island had been evacuated. Thus ended the 15-month campaign with the Aleutians cleared of all enemy forces at a cost to Japan of 59 vessels including 29 warships.

ALEXANDER, Sir Harold Rupert Leofric George, British Army officer: b. County Tyrone, Northern Ireland, Dec. 10, 1891. As Supreme Allied Commander in the Mediterranean theater in the final months of the war with Germany, Field Marshal Alexander directed Allied operations on the Italian mainland. He replaced Field Marshal Sir Henry Maitland Wilson in that command in November 1944, and was at the same time designated field marshal. On July 31, 1945, he was appointed governor general of Canada, to succeed the Earl of Athlone.

Field Marshal Alexander is a veteran of action on several fronts in the Second World War. On Dunkerque's beaches on May 31, 1940, he assumed command of the remaining British troops and completed their evacuation on June 2. In February 1942, he assumed command on the Burma front two days before Rangoon fell to the Japanese. He was summoned to the Middle East the following August, to organize the British Eighth Army opposing Rommel's Afrika Korps. Subsequently, as General Eisenhower's deputy commander in chief and commander in chief of Allied Ground Forces, he directed the offensive in Tunisia, and was in large part responsible for conceiving the strategy by which Tunis and Bizerta fell to the Allies on May 7, 1943. He later helped map plans for the conquest of Sicily and served for a time as military governor of that Italian island. He also shared responsibility with General Eisenhower, Admiral Cunningham, and Air Marshal Tedder for planning the invasion of Italy, Sept. 3, 1943. He became Allied commander in chief in Italy in December 1943.

In the First World War, Field Marshal Alexander commanded the Irish Guards, and from 1919-20, served in Northern Russia with a battalion of the Baltic Landwehr.

ALGERIA. French territory in North Africa. The area is 847,500 square miles, and the population was estimated in 1940 to amount to 7,600,000. The census of 1936 gave a population of 7,234,684, of whom 6,247,432 were Moslem natives and 853,209 French. Northern Algeria is regarded as an integral part of France, and Southern Algeria is under a semimilitary organization (see below). The country was liberated from pro-Axis control following the Allied landings on the French North African coast on Nov. 7-8, 1942. It was then administered by Gen. Henri Honoré Giraud until June 3, 1943, when responsibility was assumed by the French Committee of National Liberation; after Gen. Charles de Gaulle's provisional government of the French Republic was established in Paris in September 1944, Algeria resumed its prewar status.

Climate and Geography.—Algeria contains three agricultural regions. The first is a rich coastal district, sometimes called the Tell zone, between the seacoast and the first range of hills known as the Tell Atlas, where cork and wine-growing are the chief economic pursuits. Second comes the high tableland zone between the Tell Atlas and the Saharan Atlas proper which produces the

bulk of the cereal crops, such as wheat, barley and oats. The interior districts of this zone, bordering the desert, consist of great alfa-producing areas and extensive stock-raising tracts. Third is the desert portion where numerous oases produce large quantities of dates, an important article of export, as well as part of the daily diet of the natives.

The coastal region has a high humidity all year and a rainy season from November through March, the average annual rainfall being about 30 inches. South of the coastal mountains, the amount of rainfall decreases rapidly, the non-desert areas being a long and relatively narrow strip.

Minerals.—Mineral wealth is considerable. Two minerals which have been exploited to a significant degree are iron ore and natural phosphates. Iron ore occurs chiefly in the vicinity of Oran, and phosphate beds with a thickness of 4 meters are located near Sétif and Batna. Iron pyrites and gypsum are found extensively, and there are smaller deposits of antimony, copper, silver-lead ore, mercury, rock-salt and zinc ore. Petroleum has been produced on a small scale at Tliouanet, near Mascara. Insignificant quantities of lignite coal occur, and arsenic, diatomite and barite are found.

People and Cities.—Berbers (2,100,000 in 1936), the original inhabitants of Algeria, and Arabs (5,890,000) are of the Islamic faith. With few exceptions, all were subjects, with no political rights, until 1919, when monogamous farmers or proprietors who had fought in the First World War and could speak and write French were admitted to citizenship; in 1943 all persons having a speaking and reading knowledge of French were made citizens. In 1943, also, citizenship was restored to Jews, who had lost it in 1940. Besides French (853,209 in 1936), natives, and Jews (numbered with the French), there are Spanish (91,942), Italian (20,929) and Maltese (2,976) in Algeria.

About 22 per cent of the population is urban, concentrated in a few leading cities, mostly seaports along the Mediterranean coast. Algiers (pop., 1936, 252,321) is the capital and chief port. The city was the headquarters of the Allied forces during the North African campaign of 1943, and of de Gaulle until France was liberated in 1944. Because of its mild climate, Algiers is a favorite winter resort for Europeans. Oran (pop., 1936, 194,746) is an important port at the northwestern end of Algeria. Bone (Bona), one of the chief northeastern ports (pop., 1936, 83,275), has one of the best harbors in Algeria. Philippeville (pop., 1936, 64,857) serves as the port for the more populous city of Constantine. Several large cities are located inland, though near the coast. Among the more important are Constantine (pop., 1936, 106,830) and Sidi-bel-Abbes (pop., 51,094).

Religion and Education.—Not more than 10 per cent of the natives, virtually all of whom are Moslems, have even an elementary education. Primary schools for natives numbered 689 in 1938, with 76,859 pupils enrolled. At that time less than 200 students were enrolled at *médersas*, schools of higher education for natives at Algiers, Tlemcen and Constantine. With the exception of the natives and the Jews, most inhabitants of Algeria are Roman Catholics. Primary and higher primary schools for them numbered 1,224 and 30, respectively, having 159,725 and 9,386 pupils. There were six teacher-training schools (half of them for women teachers), with a combined enrolment of 484. The University of Algiers, with

2,248 students in 1938, has faculties of arts, law, medicine and pharmacy, and science; and affiliated schools of agriculture, commerce, fine arts, and hydrography.

Government.—The country has been organized into two divisions: Northern Algeria, consisting of the departments of Algiers, Oran and Constantine; and Southern Algeria, comprising Ain Seфра, Ghardaia, Touggourt, and the Saharan Oases. The departments of Northern Algeria elected 10 deputies and three senators to the Parliament of the Third Republic. Administration of Southern Algeria was conducted by military authorities under direction of a governor general, who represented the French government throughout the country. The non-Moslem services of justice, education, military and naval affairs, worship and the treasury were under appropriate ministers in France. The governor general was assisted by three advisory assemblies—a Council of Government (of high officials), a Financial Delegation (representative of French citizens and subjects) and a Superior Council (comprising *ex officio* and elected Europeans and natives). The functions of these bodies were suspended in 1941, when the country was subject to Vichy's corporative rule, but were restored by Giraud on March 17, 1943. The provisional government of the French Republic approved on Sept. 6, 1944, the appointment of Yves Chataigneau as governor general of Algeria. Ultimate responsibility for the internal and external security of Algeria, Morocco, and Tunisia had been vested in the commissioner of state, delegate general for North Africa, on August 28, 1944, but this new post was abolished when Gen. George Catroux, the first incumbent, was appointed to the ambassadorship at Moscow.

Finance.—The budget, comprising imposts of all types collected within Algeria and all civil disbursements, has been distinct from that of France since 1901. There is a separate budget for Southern Algeria. Normally expenditures for war and marine are borne by France and therefore excluded from the budget estimates, but the military tax, the government monopolies, and some special revenues are paid to France. While Algeria was subject to the Vichy regime, during 1940-42, no budgetary statistics were published. A consolidated budget for all of French North Africa was adopted in January 1943 by Gen. Henri Giraud, then high commissioner, the greater part of the expenditure being earmarked for military purposes. The revenue of Algeria for 1944 was estimated at 4,623,863,652 francs, and expenditure at 4,619,286,835 francs. After the landing of Allied troops in North Africa in 1942, the rate of exchange was fixed at 300 francs for one pound sterling; the next year the exchange was pegged at 200 francs to the pound.

Defense.—Prior to the collapse of France in June 1940, the Algerian military forces, together with those of Tunis, made up the 19th Army Corps of the French Army, consisting of 3 divisions, including 6 regiments of Zouaves, 6 regiments of cavalry, 3 groups of field and 1 of heavy artillery, 1 battalion of engineers, and 1 regiment of the flying corps, all of which were European troops. There were also 12 regiments of native Algerian tirailleurs, 6 regiments of spahis, (Arab cavalry), and the Foreign Legion of 4 regiments, recruited from foreigners of any nationality, but commanded largely by French officers. After the French-Italian armistice of June 24, 1940, the military forces of Algeria were demobilized. Immediately after the Allies had landed, late in

1942, the military forces of Algeria and other parts of French North Africa were reconstituted, with Gen. Henri Giraud as their first commander in chief, equipment being supplied under lend-lease by the United States. These French troops fought with distinction in the subsequent African and European campaigns against the Germans.

Agriculture, Stock and Fish.—Algeria is mainly an agricultural country, and its economic structure hinges on its crops. The country produces more dates than any other part of North Africa, while the vine is the most important crop tended by Europeans. For Algeria as a whole, however, cereal crops rank second to dates in economic value, large areas being under wheat, barley, oats, corn (maize) and rye. Legumes and white potatoes do well, and in districts where water is scarce, olives are cultivated on a considerable scale. Under normal conditions, large areas are under tobacco, flax, silk and cotton. Through 1940-42, while Algeria was subject to the Vichy regime, farmers were required to produce large quantities of oil-bearing plants for German use, including, besides the olive, castor, flax, sunflower and soybean. Citrus cultivation holds a large place in the agricultural economy, and almonds, figs, minor fruits and vegetables are also grown. The outlook for agricultural crops in 1945 was the worst faced by Algeria in half a century, this situation having been brought about by drought, poor cultivation, and inefficiency of labor on account of malnutrition. Uprooted vines have not been replanted, and shortage of sulphur caused great damage by mildew. Land under cereal crops in 1944 was 300,000 hectares less than in 1938, and exports of cereals were practically at a standstill; whereas they had amounted to 6,500,000 quintals until 1942, exports of cereals had decreased by February 1945 to 2,540,000 quintals. The wheat shortage in Algeria during 1944-45 was estimated to amount to 7,750,000 quintals, and the country was expected to produce in 1945 only 2,350,000 quintals of hard wheat and 820,000 quintals of soft-wheat. The shortage of barley and other cereals in 1944-45 was placed at 4,290,000 quintals, while the domestic crop of barley in 1945 would be only 1,555,000 quintals. The camel is still used for transportation by the natives in southern Algeria; and there are considerable numbers of sheep, and lesser quantities of asses, cattle, goats, horses and mules. Coastal waters of the country yield anchovies, sardines, shellfish, sprats, and tunny.

Production.—Wine-making and spirit-distilling are the most important industries in Algeria, and the growing of cereal crops holds next place. Cork-oak trees found concentrated in coastal forest areas yield a good grade of cork which gives employment to many persons. Other industries include the manufacture of tobacco and cigarettes, silk spinning and cotton ginning. Great numbers of the population are employed in mining, particularly at the deposits of gypsum, iron ore, iron pyrites, phosphate rock and rock-salt; and a relatively smaller number in the fisheries.

Foreign Trade.—Export trade was thrown into confusion after France surrendered in 1940, and no figures of foreign trade later than those for 1938 have become available. In that year principal exports had the following values (in millions of francs): wines, 2,900; cereals, 280; olive oil, 185; sheep, 142; spirits, 138; esparto grass, 75; and phosphate, 44. France was the principal market for most of these products. Algeria bought from the Republic, in turn, most of her imports in the first four of the following principal cate-

gories (expressed in millions of francs); machines and spare parts, 260; textiles, 250; sugar, 205; iron and steel, 112; coffee, 150; livestock, 110; cereals, 105; coal, 105; and petroleum, 77.

Communications.—In 1942 there were 2,734 miles of standard-gauge railway, of which 834 constituted the line from Oudjda, Morocco, to Ghardimaou, Tunisia, through Tlemcen, Oran, Algiers, Constantine, and Souk-Ahras. Branches connect with the ports and with the mines inland. The road system totals more than 40,000 miles, of which about 7,640 are improved. At the outbreak of the Second World War in 1939, construction was suspended on a second transversal highway across Algeria linking Tunisia with Morocco. A motor road also connects Algeria southward with Zinder and Niamey, in the Niger Colony of French West Africa. There are 12 ports with poor anchorages besides the good harbors at Algiers, Oran, Bone (Bona) and Philippeville. In 1938 a total of 12,441,000 tons was handled at all ports, but, on account of war conditions, this figure fell in 1940 to 6,277,000 tons. Before the war, air services from France reached Algeria and continued to Brazzaville, in the French Congo, and Elizabethville, in the Belgian Congo; and there were local air connections between all the territories of French North Africa.

Principal Events in 1945.—The fundamental racial and religious differences between Frenchmen and Moslems which had created strained relations throughout North Africa and the Levant became particularly acute in Algeria, where leaders of a movement termed Friends of the Manifest and of the illegal Algerian Popular Party aroused the people against the French administration. Religious issues between Jews and Moslems were superimposed upon these political difficulties, and were climaxed in 1945 by grave discontent because of the severe shortages in food due to crop failures. The result was a serious outbreak of rioting which commenced in the Constantine department on May 8 coincident with the celebration of V-E Day. Local authorities at Sétif and Guelma, chief centers of the disturbance, were unable to cope with the situation, and troops were called in. According to Adrien Tixier, minister of the interior, before the riots had been quelled 88 Frenchmen had been killed and 150 wounded, while 1,200 to 1,500 natives were killed and 2,400 arrested. The government shipped to Algeria large quantities of wheat sorely needed at home, and also diverted cargoes of cereals from the United States which had been intended for France. Tixier also promised the Algerians that the French administration of the country would be reorganized and that they should have a greater representation in the legislature. Municipal elections held on July 23 showed a great swing to the Left in all cities; at Algiers, although many natives boycotted the elections, the Conservative groups gained only five seats and the Moslems 15, while 31 candidates were elected by the Communists, Socialists, and the Resistance group. This result was considered a portent for the later alignment of parties in France itself.

ALTRUSA INTERNATIONAL. An organized, classified group of more than 6,000 executive and professional women, in some 200 clubs

throughout the United States, Canada, Mexico, and Puerto Rico, who work together to carry out Altrusa's program of service: to foster community, state, national, and international betterment. Membership is highly classified; one outstanding representative of each particular classification of business or profession is admitted, and membership is by invitation.

Taking its name from the word "altruism," the first Altrusa Club was organized in Nashville, Tenn., April 11, 1917. On August 21, 1917, Altrusa incorporated, thus becoming the first national organization of executive and professional women, either classified or unclassified. Vocational guidance was adopted as Altrusa's national policy at the Kalamazoo Convention, in April 1924. Publication of a national monthly magazine (*The Altrusan*, 10 issues a year), was begun in October 1924. The first permanent headquarters was opened in Chicago, August 1931. In June 1935, Altrusa became international.

The organization's objectives are: to cultivate friendly relationships, promote mutual understanding, and foster the solidarity of women who are actively engaged in business and the professions in an executive capacity; to be of service to young and mature women entering business and professional fields; to encourage participation in community and public affairs of a nonpartisan character; to do any and all things conducive to the betterment and ultimate welfare of women.

Altrusa International maintains a Grants-In-Aid Fund which provides gifts of money to women from the other Americas who wish to continue higher study in the United States. The fund was put into operation in 1945 and five women received grants.

The organization confers a Distinguished Service Award biennially. Madame Chiang Kai-shek was the recipient in 1943. In 1945, Anne O'Hare McCormick, member of the editorial staff, *The New York Times*, was chosen as the woman whose outstanding accomplishments earned her this recognition.

New international officers were elected by mail in 1945. The new international president of Altrusa, elected for the 1945-47 biennium is Miss Mamie D. Larsh, an Indianapolis, Ind., attorney who holds a number of important positions. Among her several offices are those of president and treasurer of the Champion Coal Corporation, and vice president, treasurer and director of the Midland Electric Coal Corporation.

LUCILLE HECHT,
Editor, International Altrusan Magazine.

ALUMINUM. Production of primary aluminum in 1944 totaled 776,446 short tons, a decline of 15.6 per cent from the all-time mark of 920,179 tons reached in 1943, according to the United States Bureau of Mines. The 1944 output was valued at \$222,416,000. This compares with the 920,179 tons in 1943 valued at \$265,380,000, and 521,106 tons in 1942 valued at \$151,371,000. Apparent domestic consumption of primary aluminum in 1944 totaled an estimated 635,000 tons, as compared with 877,381 tons in 1943, and 588,969 tons in 1942. Of the primary and secondary aluminum consumed in the form of fabricated products (excluding imports), about 65 per cent went into aircraft construction in airframes, landing gear, engines, propellers, and fittings. More than half of the remainder was used in ship construction, tanks, trucks, ordnance, and other military uses. Only

a small portion of normal civilian requirements was met.

ALWIN, Karl Oskar, German conductor, pianist, and composer: b. Königsberg, Germany, April 15, 1891; d. Mexico City, Oct. 15, 1945. Conductor at the Vienna Staatsoper from 1920 to 1938, Dr. Alwin had been conducting the Opera Nacional in Mexico City since 1941. Educated in philosophy and music at the University of Berlin, Dr. Alwin studied with Humperdinck and Hugo Kaun, then in 1912 became a coach for the conductor, Karl Muck. He conducted in Halle, Posen, Düsseldorf, and was appointed first conductor of the Hamburg Opera House in 1917. In 1924 he conducted a *Ring* cycle and several Strauss operas at Covent Garden in London. He was known in the United States as accompanist on tours with the singer, Elisabeth Schumann, whom he married in 1920. They were divorced in 1936. In 1938 Dr. Alwin left Austria for the United States and for a time served as accompanist to the tenor, Jan Kiepura, on a nationwide concert tour. Later he went to Hollywood and in 1939 took the post of opera conductor with the Chicago Civic Opera Company, remaining there through 1940. During the four years he conducted in Mexico City, he made frequent trips through Central and South America and during his last journey, in 1945, he directed a season of opera at the Teatro Municipal in Rio de Janeiro. As a composer, Dr. Alwin is best known for his songs.

AMERICAN ACADEMY OF ARTS AND LETTERS.

The American Academy of Arts and Letters was founded in 1904 by the National Institute of Arts and Letters. The membership of the academy is limited to 50, chosen only from the members of the institute.

On May 18, 1945, the academy and institute held their fourth joint public ceremonial at which new members of both organizations were inducted, medals awarded, and fifteen \$1,000 "Arts and Letters Grants" given. These grants are awarded from time to time to nonmembers to further creative work in the arts. The Howells Medal was awarded to Booth Tarkington, for fiction; the academy's Stage Diction Medal to Eva LeGallienne; and the Award of Merit Medal, for poetry, together with a cash prize of \$1,000, to W. H. Auden. Walter Lippman delivered the 24th address on the Evangeline Willbourn Blashfield Foundation, "American Destiny." An exhibition of sculpture by Paulanship, recipient of the gold medal of the institute for 1945, together with the works of newly elected members and recipients of art grants, was opened in the art gallery and continued through June 29.

The annual meeting took place on November 2, at which time the following new members, Douglas S. Freeman, Robinson Jeffers, and Lee Laurie, were elected to fill vacancies. The academy occupies its own buildings at 633 West 155th Street and 632 West 156th Street, New York City.

FELICIA GEFFEN,

Assistant to the President, American Academy of Arts and Letters.

AMERICAN ACADEMY OF ARTS AND SCIENCES.

The academy was founded in 1780, largely through the interest of John Adams in the encouragement of learning. A charter of incorporation was granted May 4, 1780. Membership was not at any time confined to Boston and its immediate vicinity, though the charter prescribed limits only for members resident in the common-

wealth. Academy bylaws have, however, prescribed limits to the number of nonresident and of foreign honorary members. The first publications of the academy were issued as "memoirs" in 1785. The Rumford Fund was established by a gift from Count Rumford, July 12, 1796. As originally conceived, this fund provided for the award of a gold and a silver medal for important discoveries in the field of light and heat. Subsequently, provision has been made for awards in aid of research. By a bequest in the will of Francis Amory, a fund was established for prize awards each seven years beginning in 1941, for notable work in urinogenital surgery and research. A fund to assist in publication of scientific papers was established in 1854 by Samuel Appleton of Boston. This fund has since been considerably increased by donations from fellows and friends of the academy.

The academy administers the income from two funds established to further research: the C. M. Warren Fund, established in 1891 to aid research in chemistry; the Permanent Science Fund, established in 1928 to aid work in any recognized scientific field.

The academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: mathematical and physical sciences, natural and physiological sciences, the social arts, and the humanities.

The officers of the academy for 1944-45 were: president, Howard Mumford Jones; treasurer, Horace S. Ford; corresponding secretary, Abbott Payson Usher; recording secretary, Hudson Hoaglund.

Three grants for research were made by the committee on the Permanent Science Fund. All income from the Rumford Fund and from the C. M. Warren Fund was reserved for use after the close of the war.

ABBOTT PAYSON USHER,
Corresponding Secretary.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. On April 13 and 14, 1945, the American Academy of Political and Social Science held in Philadelphia its 49th annual meeting. In accordance with the custom of many years the two days were devoted to a discussion of current world conditions, the general topic being "Twentieth Century Agreements and Disagreements." The addresses delivered at the meeting appeared as the July 1945 issue of *The Annals* with the title "Our Muddled World."

The academy was organized about 60 years ago and now has some 11,500 members in all parts of the world. Meetings are held in Philadelphia. The first one in the fall of 1945 was on October 5 with the topic "The Place of Science in a Democracy."

The Annals is the bi-monthly journal of the academy, each issue being a symposium on a special topic.

As a part of its service the academy provided its members during 1945 with important documents including: "UNRRA; Organization, Aims and Progress," made available through the United Nations Relief and Rehabilitation Administration, March 1945; "Charter of the United Nations," made available through the United States Department of State, July 1945; "Science for Life or Death" by Brig. Gen. David Sarnoff, distributed through the courtesy of the Radio Corporation of America, September 1945.

Officers for the year were: president, Ernest Minor Patterson; secretary, J. P. Lichtenberger;

treasurer, Charles J. Rhoads; assistant secretary, Anne Elderton; assistant treasurer, Thomas S. Hopkins; vice presidents, Herbert Hoover, Carl Kelsey, C. A. Dykstra.

Headquarters: 3457 Walnut Street, Philadelphia 4, Pa.

ERNEST MINOR PATTERSON,
President, The American Academy of Political and Social Science.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. This association was organized in 1848 and incorporated in 1874 under the laws of the Commonwealth of Massachusetts. Its interests extend over the fields of the natural and the social sciences and its operations are organized under 15 sections: Mathematics (A), Physics (B), Chemistry (C), Astronomy (D), Geology and Geography (E), Zoological Sciences (F), Botanical Sciences (G), Anthropology (H), Psychology (I), Social and Economic Sciences (K), Historical and Philological Sciences (L), Engineering (M), Medical Sciences (N), Agriculture (O), and Education (Q). About 7,500 members of the association are affiliated with the section on medical sciences and about 5,200 with the section on chemistry. The total membership exceeds 27,000. In addition to its own sections, 190 independent scientific societies, having a total membership exceeding 500,000, are affiliated with the association and many of them join in its meetings. The association has three serial publications, the *A.A.A.S. Bulletin*, *Science* and *The Scientific Monthly*. Subscriptions for the *Bulletin* and for either *Science* or *The Scientific Monthly* are included in the annual membership dues of \$5. *Science*, a weekly journal now in its 102d volume, has a circulation of over 20,000; *The Scientific Monthly*, now in its 61st volume, has a circulation of over 14,000. The association has published 24 technical volumes on such subjects as tuberculosis and leprosy, mental health, blood, heart and circulation, the genetics of pathogenic organisms, human malaria, aerobiology, the chemistry and physiology of hormones, surface chemistry, and cancer.

F. R. MOULTON,
Permanent Secretary, American Association for the Advancement of Science.

AMERICAN AUTOMOBILE ASSOCIATION. Founded in 1902, the AAA is the world's largest motor federation, with 650 clubs and branches throughout the United States, and 1,350,000 car-owning members. Activities of the organization are broadly defined as follows: (1) work for the improvement of motoring conditions generally; and (2) the rendering of personal services to the individual motorist so that the operation of his automobile may be easier and more pleasant, with aid for any motoring difficulties he encounters. One of the most important objectives of the AAA in the realm of public service is the betterment of highways.

Another field pioneered by the AAA is that of safety responsibility. Model legislation, drafted in 1928 and revised in 1944, has served as the basis for safety responsibility laws adopted by approximately three quarters of the states and eight of the nine Canadian provinces.

The AAA has been for years at the forefront in the battle to keep taxation of the motor vehicle on a fair and equitable basis. It has taken or shared leadership in 8 successful campaigns for state constitutional amendments prohibiting the diversion to other uses of money collected for highway purposes.

As part of a broad-gauge safety program the AAA has sponsored a School Safety Patrol system, which has a third-of-a-million school-age members in 3,500 communities.

Sponsorship of progressive legislation designed to promote uniformity of motor vehicle laws has been a long-time and continuing interest of the AAA. The organization has worked for adequate markings of highways, freedom of travel across state borders, elimination of abuses in the financing of automobiles and automobile accessories, provision for adequate parking facilities, and protection of roadsides through proper control measures. The curbing of speed-traps, fee-splitting by enforcement officials, and aid in preventing any abuses that might arise in the sale and distribution of petroleum products are other aspects of AAA activity in the interests of all motorists.

AAA Activities in 1944-45.—Since Pearl Harbor, the American Automobile Association has augmented its normal peacetime program, heretofore described, with many new services. These have included aid to the government in its struggle to keep transportation rolling, and help for the individual motorist in solving the problem of operating his car as efficiently and fully as possible in the face of restrictions on driving, frequent changes in the regulations governing car use, vehicle obsolescence, and shortages of replacement parts and garage manpower.

During the year a new phase of the AAA driver training program was developed, designed to meet the needs of returning disabled servicemen. This was worked out in co-operation with the Office of the Surgeon General of the United States Army. The program, which aids amputees in acquiring or reacquiring driving confidence and competence, had its inception at Forest Glen, Md., the Army Convalescent Hospital.

Special efforts were made under AAA leadership to effectuate repeal of the \$5 Federal Use Tax on cars, widely regarded as a nuisance levy on the motorist, and having no legitimate place in the peacetime tax structure. The tax will be wiped from the statute books at the end of the fiscal year.

Officers of the Organization.—These are: president, H. J. Brunner, San Francisco, Calif.; secretary, John L. Young, Cleveland, Ohio; treasurer, Corcoran Thom, Washington, D.C.; assistant treasurer, Frederick P. H. Siddons, Washington, D.C.

CLARENCE G. TAYLOR,
Department of Public Relations, American Automobile Association.

AMERICAN BANKERS ASSOCIATION. Organized by a group of bankers in 1875, this association is composed of 15,500 commercial banks, savings banks, and trust companies, of which approximately 11,500 are small banks serving small communities. It is supported by dues paid by member banks. It publishes *Banking*, a monthly magazine; *The Trust Bulletin*, monthly publication of its trust division; *A.I.B. Bulletin*, monthly publication of its educational section; and numerous booklets and manuals. Officers elected in 1945 were: president, Frank C. Rathje, chairman of the board and president of the Chicago City Bank and Trust Company; executive manager, Dr. Harold Stonier; secretary, Merle E. Seelman. Organization headquarters: 22 East 40th Street, New York City.

AMERICAN BIBLE SOCIETY. An organization founded in 1816, having as its sole object "to encourage a wider circulation of the Holy Scriptures without note or comment." There are

auxiliary societies in various parts of the country, and also 11 home agencies, which together cover every part of the United States. There are also 12 foreign agencies. The society has a total membership of over 10,000. During 1944 (the last year of record) it distributed a total of 12,172,139 volumes of Scripture, in many languages and dialects, including braille. Between July 1, 1940, and Sept. 30, 1945, the society issued a total of 8,576,924 Bibles and Testaments for the armed forces; 1,700,301 volumes in 40 different languages for prisoners of war on both the Allied and Axis sides; and 695,359 volumes for the liberated areas, 355,352 since July 1, 1945. A total of 480,997 volumes were distributed among German and Japanese prisoners of war between July 1 and Sept. 30, 1945.

Officers for 1945 were: president, Daniel Burke, LL.D.; executive secretary, the Rev. Dr. Eric M. North, Ph.D.; recording secretary, Francis C. Stifler. Organization headquarters: Bible House, Park Avenue and 57th Street, New York 22.

AMERICAN COLLEGE OF SURGEONS. This society, organized in 1913, had, at the close of 1945, more than 14,500 members, including fellows and honorary fellows. Its primary object is to elevate the standard of surgery. Therefore, admission to fellowship is based on merit only. The history of the organization and its major activities are given in detail in preceding issues of *THE AMERICANA ANNUAL*.

Hospital standardization is a subject in which the college has manifested great interest, and, according to its latest report, 3,181 or 80.8 per cent of the hospitals in the country with 25 beds or over have been fully or conditionally approved; 40.2 per cent of the hospitals having from 25 to 49 beds have been approved; 70.3 per cent of those having from 50 to 99 beds have been approved; 93.1 per cent of those having 100 or more beds have been approved; and all government hospitals have been unqualifiedly approved.

A department of graduate training in surgery has been organized to render assistance to individuals seeking training in surgery, especially those whose training has been interrupted by service with the armed forces. Definite requirements have been established by the college. There are 250 hospitals which are operating acceptable plans, and 500 additional selected hospitals are now being studied by the college from the standpoint of their ability to provide adequate graduate training in surgery and the surgical specialties. As a guide to the trainees, the college has prepared a volume that lists all of the hospitals and clinics approved to the date of publication for graduate training in surgery and the surgical specialties in the United States and Canada. The college is pledged to give every possible aid to the returning medical officer who desires to complete his training which was interrupted by his military service.

The college owns property valued at over \$1,750,000, with headquarters at 40 East Erie Street, Chicago 11, Ill. Present officers are: president, W. Edward Gallie, Toronto, Ontario; first vice president, Clarence G. Toland, Los Angeles, Calif.; second vice president, Albert C. Furstenberg, Ann Arbor, Mich.; secretary-treasurer, Dallas B. Phemister, Chicago, Ill. Officers-elect: president, Irvin Abell, Louisville, Ky; first vice president, Leland S. McKittrick, Boston, Mass.; second vice president, F. Phinizy Calhoun, At-

lanta, Ga. Dr. Franklin H. Martin, founder of the college in 1913, was its director-general from that time until his death, March 7, 1935.

The executive committee is composed of Drs. Irvin Abell, chairman; Arthur W. Allen, Frederick A. Collier, John R. Fraser, Harry S. Gradle, Howard C. Naffziger, Dallas B. Phemister, and W. Edward Gallie, ex officio.

The administrative board is comprised of the following: Malcolm T. MacEachern, associate director, chairman; Bowman C. Crowell, associate director, vice chairman; E. W. Williamson, assistant director; Miss Eleanor K. Grimm, secretary to the board of regents, secretary; Edward G. Sandrok, comptroller.

The administrative assistants are: E. W. Williamson, assistant director; Maj. Gen. Charles R. Reynolds, M.D., U.S.A. (retired), consultant in graduate training in surgery; George H. Miller, director of educational activities; Paul S. Ferguson, director of surveys, graduate training in surgery; G. R. Hess, assistant, division of medical service in industry; Miss L. Marguerite Prime, librarian and director of literary research; Miss Laura G. Jackson, director of public relations.

ELEANOR K. GRIMM,
Secretary, Board of Regents, American College of Surgeons.

AMERICAN DENTAL ASSOCIATION, The. Founded in August 1859 at Niagara Falls, N.Y., it merged in 1897 with the Southern Dental Association formed in 1869 (as a result of the Civil War) to form the National Dental Association. In 1922, it adopted its original name, The American Dental Association.

The objectives of the association are to cultivate and promote the art and science of dentistry; to conduct or provide for dental and oral research; to improve the professional character and education of dentists; to guard the interests of the public and the dentist through dental legislation; to educate the public in matters of dental health and to represent the common interests of the members of the dental profession.

The association is governed by a democratically elected House of Delegates. Its business is transacted by its board of trustees, officers, bureaus, committees and councils. Over 60,000 of America's 70,000 dentists belong to the association.

During its 1944-45 fiscal year, through its Council on Dental Education, it completed a five-year survey of the 39 dental schools in the United States and published a list of approved and provisionally approved dental teaching institutions. Through its Council on Dental Health and Committee on Economics, the association continues its study of dental needs, methods of practice, and dental health programs. It prepared plans for, and recommended the establishment of, experimental prepayment dental programs. It established basic principles for the guidance of component dental societies in the establishment of dental programs for low income groups. It sponsored two bills in Congress, one of which would provide funds and facilities for dental research, the other would provide grants-in-aid to states for dental service for children. It assisted in the successful termination of the war by its contribution of personnel, facilities and funds. It increased its public health educational activities by greater use of the radio, press, motion pictures and other media.

The association discontinued its annual conventions for the duration. Its House of Dele-

gates held a business meeting in Chicago in October 1944. No business meeting was held in 1945. Consequently, its last year's officers will hold office until the next House of Delegates meeting in 1946. Its officers are: president, Dr. Walter H. Scherer; president elect, Dr. Sterling V. Mead; 1st vice president, Dr. Herbert E. King; 2d vice president, Dr. W. I. McNeil; 3d vice president, Dr. E. M. Clifford; secretary, Dr. Harry B. Pinney; treasurer, Dr. Roscoe H. Volland.

LON W. MORREY,
Director, Bureau of Public Relations, American
Dental Association.

AMERICAN FEDERATION OF LABOR. Precedents which had been established in previous war years were followed strictly by the American Federation of Labor during the months of war in 1945. At the same time, however, the federation persistently pressed for adequate advance postwar planning on the part of the government in order to avert widespread unemployment and attendant loss of purchasing power when the transition period should be at hand.

With the dramatic and sudden closing of the war, the executive council of the federation immediately announced a program of postwar steps which labor regards as immediately necessary in order to effectuate a speedy and orderly reconversion. This program includes provisions for the return of prewar rights and privileges which were voluntarily relinquished in the interest of the war effort, such as the restoration of free collective bargaining; end of war-time controls over labor and industry; increased wages, etc. In its official declaration made on the announcement of the termination of hostilities, the executive council of the American Federation of Labor said in part: "For its own part the American Federation of Labor believes that organized labor has an important contribution to make for the postwar recovery program . . . America still has a vitally important job to do—to win the peace."

The federation's legislative program for the immediate future calls for enactment of the Kilgore Bill providing broader unemployment compensation provisions; the enactment of the Murray-Wagner Full Employment Bill; a postwar housing bill creating millions of new jobs over a 10-year period; a law lifting minimum wage levels; and the Wagner-Murray-Dingell Social Security Bill broadening coverage under the law and expanding its services.

The American Federation of Labor is not a political organization—it does not seek to control the government or to have the government control the trade unions. It advocates labor co-operation along trade union lines in the international field.

The federation is the official representative of the American workers in the international labor field. In recognition of this fact, the federation is accorded the privilege of naming the workers delegate to the International Labor Organization. The federation seeks to further the establishment of free trade unions throughout the world, both in the interest of better working and living conditions for the wage earners, and to combat the rising tide of communistic and other revolutionary philosophies and theories among the workers of the world.

The federation is unalterably opposed to government-controlled, or communist-controlled associations of workers and has steadfastly refused to participate in international conferences which accorded representation to such organization.

has likewise refused to become identified with movements which afford representation to organizations which aim to disrupt or divide established national trade union movements.

The American Federation of Labor entered the postwar period firm in its conviction that the future prosperity of America depends upon the success of our free economic system—a system of free enterprise and free association of workers, and release from wartime government controls.

The American Federation of Labor had a paid-up membership in July 1945 of 6,946,218. Its resident officers are William Green, president, and George Meany, secretary-treasurer, with headquarters in the A. F. of L. Building, Washington, D.C.

WILLIAM GREEN,
President, American Federation of Labor.

AMERICAN GEOGRAPHICAL SOCIETY. Oldest geographical society in the United States, founded in 1852 "to collect and disseminate geographical information by discussion, lectures, and publications; to establish in the chief city of the United States a place where may be obtained accurate information concerning every part of the globe; and to encourage such exploring expeditions as seem likely to result in valuable discoveries in geography and related sciences."

The society has taken a leading part in the advancement of geographical research. It issues two periodical publications—a quarterly journal, *The Geographical Review*, and a monthly bibliography of current geographical literature—and has edited and published some 60 books in several special series. Most recent among the latter are (1) *Mirror for Americans: Likeness of the Eastern Seaboard, 1810*, by Prof. Ralph H. Brown, a scholarly reconstruction of the geographical aspects of the eastern United States in Thomas Jefferson's time; (2) *Japan: A Geographical View*, by Prof. Guy-Harold Smith and Dr. Dorothy Good, a factual analysis of Japan's geographical position, with its strategic and economic implications and (3) *Pioneer Settlement in the Asiatic Tropics: Studies in Land Utilization and Agricultural Colonization*, by Dr. Karl J. Pelzer, dealing with the background and operations of the agricultural settlements sponsored by the Netherlands Indies and Philippine governments in the years before the war.

For 24 years the society has been engaged upon the production of a map of Latin America which conforms essentially in style and standards with the "International Map of the World on the Scale of 1:1,000,000." The 107th and last sheet of this map has now been completed. The society has issued a set of alphabetical indexes, by countries, to the location of all of the 200,000 or more names on the map, and during 1944 issued a civil divisions base map of Latin America in three sheets (1:5,000,000).

The advent of the airplane has brought revolutionary changes in exploratory surveying methods. The society has for many years been engaged in research in the application of air photography to map production. Studies of map projections and other aspects of mathematical geography are also being conducted. A map on an azimuthal equidistant projection showing true directions and distances from New York City was prepared in the summer of 1944 at the request of the Port of New York Authority and has been published. A large part of the society's activity during the war years was devoted to work for the departments of State and of War. Some eighty projects of varying magnitude have been carried

out for the Department of State since 1942, when the society's research and cartographic facilities were placed at its disposal. In May 1944 a conference of medical men and geographers was held to discuss an atlas of diseases which the society proposes to produce with the collaboration of medical scientists. As a pilot project in this connection an investigation is being made of the geographical distribution of fluorine in the water supplies of the United States.

The society's collection of geographical books and maps, one of the largest of its kind, has been placed unreservedly at the service of many different government agencies by whom it has been extensively used during the past four years. A regular program of six lectures is given each winter. The society awards four gold medals in recognition of particularly distinguished work in exploration or geographical research.

Officers and professional staff: president, Roland L. Redmond; vice presidents: H. Stuart Hotchkiss, William A. Rockefeller, Frederic C. Walcott; domestic and foreign corresponding secretary, Robert Cushman Murphy; recording secretary, Carl C. Shippee; treasurer, R. McAllister Lloyd; director, John K. Wright; editor of *The Geographical Review*, G. M. Wrigley; librarian, Nordis Felland; map curator, Ena L. Yonge; Hispanic American research, C. B. Hitchcock, R. R. Platt; survey and maps, O. M. Miller; exploration and field research, Walter A. Wood (on leave of absence in U.S. Army).

JOHN K. WRIGHT,
Director, American Geographical Society.

AMERICAN HISTORICAL ASSOCIATION.

Founded in 1884 and incorporated by act of Congress in 1899, it publishes an *Annual Report* (usually in two volumes, and containing the *Proceedings*); *The American Historical Review*, a quarterly; and in co-operation with the National Council for Social Studies, *Social Education*. The membership of the association numbers 3,628. The 1944 prize awards were: the Herbert Baxter Adams Prize (without stipend), to R. H. Fisher for his study, *The Russian Fur Trade, 1550-1700*; the John H. Dunning Prize of \$100 to Lieut. Elting E. Morison, U.S.N.R., for his volume, *Admiral Sims and the Modern American Navy*. The John H. Dunning Prize Committee also gave honorable mention to Charles L. Mowat, *East Florida as a British Province, 1763-1784* (early American history); Lieut. Jeter A. Iseley, U.S.N.R., *Horace Greeley and the New York Tribune* (national political history); and Richard A. Hofstadter, *Social Darwinism* (history of thought).

Officers of the association for 1945 were: president, Carleton J. H. Hayes, Columbia University; vice president, Sidney B. Fay, Harvard University; treasurer, Solon J. Buck, Washington, D.C.; executive secretary and editor, Guy Stanton Ford, Library of Congress Annex; assistant secretary-treasurer, Patty W. Washington, same address. Headquarters: Study Room 274, Library of Congress Annex, Washington 25, D.C.

AMERICAN INDIAN. See INDIAN AFFAIRS; MUSEUM OF THE AMERICAN INDIAN.

AMERICAN LEGION, The. An organization of honorably discharged veterans, male or female, of the First and Second World wars. It was originally chartered by Congress in 1919 as an association of veterans of the First World War; it became a two-war organization on Oct. 29, 1942, when President Roosevelt signed an act making veterans of the Second World War eligible for membership. As of July 25, 1945, the

membership totaled 1,618,446, enrolled in 58 departments and more than 12,000 posts. It was stated that up to June 30, 1945, more than 500,000 veterans of the Second World War had affiliated themselves with the American Legion, making it the largest Second World War organization as well as the largest First World War organization. Membership dues vary according to posts with an average of about \$3 to \$5 a year. The organization publishes two monthly magazines—*The American Legion Magazine* and *The National Legionnaire*. Officers on July 30, 1945, included Edward N. Scheiberling, Albany, N.Y., national commander; and Donald G. Glascoff, Indianapolis, Ind., national adjutant. Headquarters: 777 North Meridian Street, Indianapolis, Ind.

AMERICAN LIBRARY ASSOCIATION (A.L.A.).

Organized Oct. 6, 1876, in Philadelphia, it is the official association of librarians, library trustees, and others interested in libraries in the United States and Canada, although its membership, which is open to all persons and institutions, is drawn from all continents. In 1945 the A.L.A. membership numbered over 14,000. Affiliations or relations are maintained with other library groups and numerous organizations, societies and institutions. While the association's main objective is complete and adequate library coverage for the United States and Canada, especially in rural areas without library service, since the beginning of the Second World War it has devoted its efforts to wartime tasks and plans for the postwar period. Over 600 volunteer workers serve on approximately 80 committees in carrying on the work of the association, in conjunction with its officers and a staff of 87. Carl H. Milam is executive secretary. Headquarters of the association, established in 1909, are located at 520 N. Michigan Ave., Chicago 11. During 1945, the association purchased an historic Chicago mansion at 50 East Huron Street, which will become its headquarters as soon as remodeling is completed.

The A.L.A. International Relations Office, located in the Library of Congress Annex, Washington, D.C., is under the direction of Harry M. Lydenberg. A library information bureau in Washington, financed from funds contributed by librarians and friends of libraries, and operated by the association was opened in October 1945 at 1709 M St., NW, Washington, D.C. Paul Howard directs activities of this office.

Conferences.—The usual summer and winter conferences have not been held since 1942 because of the war and transportation difficulties, but a mid-winter meeting is planned for January 1946 and an annual conference in Toronto in the summer of 1946 is tentatively scheduled. At the conclusion of an officers' meeting on June 22, 1945, the following officers were inaugurated: president, Ralph A. Ulveling, Public Library, Detroit; first vice president and president-elect, Mary U. Rothrock, Tennessee Valley Authority, Knoxville; second vice president, Emerson Greenaway, Enoch Pratt Free Library, Baltimore; and treasurer, Rudolph H. Gjelsness, University of Michigan, Ann Arbor.

At the same time the annual citations for distinguished service as library trustees were presented to M. M. Harris, president of the San Antonio (Texas) Public Library Board, and Mrs. Albert W. Errett, president of the board of directors of the Public Library, Kewanee, Ill. A third citation was awarded posthumously to Charles Whedbee, former trustee of the North Carolina

Library Commission, Hartford, who was chosen in 1942 but wished to defer receiving his citation until he could attend an A.L.A. conference.

The 24th annual Newbery Medal, for the outstanding contribution to children's literature, was conferred on Robert Lawson for *Rabbit Hill*, and the 9th annual Caldecott Award, for the most distinguished picture book, to Elizabeth Orton Jones for the illustrations of Rachel Field's *Prayer for a Child*. Both medals were presented on June 9, 1945, in New York City.

Halsey W. Wilson, president of H. W. Wilson Company, was elected an honorary member of the A.L.A. by the council because of his "contribution to library efficiency and to every field where books and periodicals are used." Since its founding the A.L.A. has conferred honorary memberships on only 27 persons.

Income.—The association's endowment is approximately \$2,110,000. The income in 1944-45 (excluding cash balance of \$197,000 on Sept. 1, 1944) was about \$1,133,800. Approximately \$223,700 was derived from membership dues, sales of publications, advertising subscriptions, etc., and was used primarily for membership and publication activities. Publications are sold practically at cost as this aspect of the association's activities are conducted not for profit but in the interest of library progress. The sum of \$76,500 was income from endowment funds; \$188,000 was in payment of group retirement annuity premiums; and \$592,000 came from outside sources in the form of grants or payments for specific purposes.

Publications.—Some 20 new projects were begun, over 100 were considered, and 10 titles were published. The publishing program, which had not paid its own costs for several years, wiped out its deficit. Pamphlets and books on library work, book-buying lists for public, school and college libraries, and a growing list of indexes are published by the association, in addition to its periodicals, the *A.L.A. Bulletin*, the *Booklist*, *Subscription Books Bulletin*, *College and Research Libraries*, and the *Hospital Book Guide*. Among the 1945 publications were: *National Medical Library, School Libraries for Today and Tomorrow*, *Librarian and the Teacher of Home Economics*, *Catalogers' and Classifiers' Yearbook No. 11*, *Patrons Are People*, *Activity Book No. Two*, *Buying List of Books for Small Libraries*, 7th. ed., and *Books Published in the United States, 1939-43*.

During the fall of 1945 the association began the distribution of phonograph recordings of classic children's stories told by Mrs. Gudrun Thorne-Thomsen. This project is in co-operation with the A.L.A. Division of Libraries for Children and Young People, which is interested in the preservation of fine examples of the storyteller's art. See also *Library Progress*.

MILDRED OTHMER PETERSON,
American Library Association.

AMERICAN METEOROLOGICAL SOCIETY. See METEOROLOGICAL SOCIETY, AMERICAN.

AMERICAN MUSEUM OF NATURAL HISTORY. The. Several organizational changes were made to achieve a more effective and coherent administration of the large biologic units of the museum collections. The two departments of Fishes and Invertebrates were combined as one Department of Fishes and Aquatic Biology, under the chairmanship of Dr. Charles M. Breder, Jr. All activities in the geological and paleontological sciences were united and co-ordinated into a single Department of Geology and Paleontology, with Dr. G. G. Simpson as chairman.

With a special grant from the Viking Fund the organization of the Institute of Human Morphology, a new project in the Department of Anthropology, was begun. Dr. Erwin K. Ackerknecht, formerly research fellow at the Institute of the History of Medicine at Johns Hopkins University and recently appointed assistant curator in this museum, is in immediate charge under the direction of Dr. H. L. Shapiro, departmental chairman. The plan is to make available to research students, biologists, physical anthropologists, physicians, and X-ray specialists comprehensive collections of skeletal material for the study of the structure and form of the human skeleton. Further, such skeletal archives (osteology, wet specimens, various types of sections) are to be classified according to age, sex, normal and abnormal development, with accompanying files of X-rays, and as the collection accumulates, a series for exhibition will be selected as a nucleus for a museum of human morphology.

The post of chairman and curator of the Hayden Planetarium was filled September 1 with the appointment of Gordon A. Atwater.

Several individuals of the naval personnel stationed in the Aleutian Islands collected and presented archaeological material revealed by deep cuttings made in the course of military construction. Dr. Helge Larsen, associate curator of archaeology, excavated at several sites to test the chronology of this area. This field trip is financed by the Viking Fund and was made possible through the courtesy of the military and naval authorities. Preliminary reports from Dr. Larsen assure us of some success. He sectioned and sampled some of the deepest refuse heaps, which indicate the presence of two successive cultures possibly related to the important Ipiutak culture at Point Hope, Alaska.

Studies on the thermal requirements of reptiles were continued in Arizona by Mr. C. M. Bogert, chairman of the Department of Reptiles and Amphibians, who spent a month assembling field data at the Boyce Thompson Southwestern Arboretum near Superior. With the information already gained by experiments in Florida in 1944 it will be possible to compare the requirements of lizards in humid regions with those living in a desert. Some of the earlier results were published in *A Preliminary Study of the Thermal Requirements of Desert Reptiles* by Mr. Bogert and Dr. Raymond B. Cowles of the University of California, Los Angeles, and a record of the Florida experiments on temperature tolerances of the American alligator was prepared with these two authors by Dr. E. H. Colbert. Dr. Colbert, the curator of fossil amphibians, reptiles, and fishes, carried on a reconnaissance also in Arizona, jointly with a University of California party, and located a rich fossil reptile deposit, to be worked in the future. Fossil shells and other marine life were collected by Dr. Otto Haas in Indiana. Dr. Frederick H. Pough made an extensive field study of mineral occurrences in Brazil, continued his study of the new volcano Parícutin in Mexico, collected interesting minerals in New Mexico and Colorado, and completed his work on a remarkable new mineral, brazilianite.

The end of the war permits definite planning for more active field work. The Vernay Nyasaland Expedition (sponsored by the Department of Mammals and participated in also by the Kaffrarian Museum, King William's Town, South Africa), the first large-scale expedition since 1939, plans to be in Africa by May, 1946, and to make large collections of mammals and plant material.

A detailed report of its activities will appear in 1946.

The Department of Birds also hopes that an expedition can be sent into the Pacific to finish the work of the earlier Whitney South Sea Expedition in collecting birds and accessories to complete the five final habitat groups in the Whitney Memorial Hall. In 1945 four decorative exhibits of birds-of-paradise and other colorful species of Pacific birds were installed in this hall.

Interest in the entire Pacific area is reflected in an exhibit of the more spectacular insects collected and donated by members of the armed forces from many remote Pacific stations. A pamphlet prepared by the Department of Insects and Spiders available to these men stimulated and assisted their collecting. Dr. C. H. Curran, associate curator, prepared a handbook on *Insects of the Pacific World* for the armed services and laymen. The insect exhibits were further enriched by a fine series of color sketches by Miss Alice Gray of the successive stages of development of the saturnid moth, *Automeris io*, from egg to adult. An unusually fine collection of North American moths, over 12,000 specimens, collected by Viola H. dos Passos during her lifetime, was presented by her husband, Research Associate C. F. dos Passos.

Mounted skeletons of *Thomashuxleya*, the oldest mammal skeleton from South America, and of *Notharctus*, the oldest fossil skeleton of a primate, both prepared by Charles Lang, chief preparator in geology and paleontology, were placed on exhibition.

The list of publications in 1945 is large and important and includes: a monograph on the family Anatidae (ducks, geese, and swans) by Captain Jean Delacour, research associate, and Dr. Ernst Mayr, curator of the Whitney-Rothschild Collections, Department of Birds, which presents a large new classification of a family that has always presented many taxonomic difficulties; a large monograph on *North and South American Ascidians* (sea squirts) by Associate Curator Emeritus Willard G. Van Name; *The Principles of Classification and a Classification of Mammals* by Dr. G. G. Simpson, which, as its title shows, is a complete classification, with extensive explanatory and historical notes and bibliography, of all the higher groups of mammals and all well-defined genera; *Tempo and Mode in Evolution*, also by Dr. Simpson; *The Dinosaur Book* by Dr. E. H. Colbert, an attractive handbook for popular use; *A Preliminary Analysis of the Herpetofauna of Sonora* by Mr. Bogert and Dr. James A. Oliver; *Supraspecific Groups of the Pelecypod Family Corbulidae* (fossil mollusks) by Dr. H. E. Vokes; *Archaeology of the Hopedale Area* by Assistant Curator Junius B. Bird; *Costa Rican Stonework* by J. Alden Mason, a beautifully illustrated report on the Minor C. Keith collection; *Giant Early Man from Java and South China* by Franz Weidenreich; and numerous other reports and technical and popular articles, shorter but not less in value.

The Department of Animal Behavior included in its year's work field and laboratory investigations of the instinctive reactions of several vertebrate and invertebrate species. A six-month field study in southern parts of Mexico yielded valuable new information regarding the migratory habits of the army ant and the relation of the colony's raiding behavior to the queen's reproductive cycle. Experiments on the African mouth-breeder fish showed that the female's egg-laying rhythm is controlled by her sight of the male. No actual

contact is necessary, but if the female is to construct a nest and deposit eggs she must be able to see another fish of her species. Presumably the control is exerted through the visual nerves to the pituitary gland and thence to the sex glands. Investigations of the importance of hormones to courtship and mating in various mammalian species have revealed several significant points concerning the evolution of human behavior. It is becoming more and more apparent that in the course of evolution the higher brain centers have gained increasing importance in reproductive activity, while the regulatory function of sex hormones has correspondingly decreased.

The Department of Education laid emphasis upon the following: the completion (by March 1945) of the specialized work for the army, navy, and marine corps in landfall recognition techniques; the organization of a special division for guest services; the incorporation in the department of the division of "Man and Nature Publications" (for popular distribution and sale), with a consequent expansion both in capital outlay and additional activity; the development of a greatly expanded division of special exhibition with emphasis on special showings of current interest.

AMERICAN SOCIETY OF COMPOSERS, AUTHORS AND PUBLISHERS (ASCAP). See PERFORMING RIGHT SOCIETIES.

AMPHIBIOUS WARFARE. A term that came into common usage during the Second World War to describe combined land, sea and air operations. It was not however coined during the Second World War, as it had been used in naval and military parlance for many years before. In the past it referred only to combined land and sea operations. With the advent of air armaments, a new word might well have been adopted to connote the combined operations of all three types of forces, but the classical term has been retained and is now usually understood to include the employment of air power in addition to sea and land power. The mission of an amphibious operation may be to gain a foothold on an enemy-held shore in order to make it possible to come to grips with the enemy's ground forces, for example the invasion of France through the Normandy beach-head, or it may be to capture an island or other point as a step in a more extensive military-naval campaign, for example the capture of Okinawa on the way to Japan.

Proficiency in amphibious warfare has been throughout history a prerequisite to the growth of insular nations, such as Greece and England. The British Empire may well be said to have its roots in the genius of the English speaking people for amphibious warfare and of the recognition by British political leaders through the centuries of the importance of sea power. All warfare of this character to be successful involves the possession of sea power, but sea power, while essential, is not enough in itself to insure the success of amphibious enterprises, just as air power, while essential, is not enough in itself to win land battles. Although Great Britain has, in the main, throughout her history been highly successful in amphibious warfare, she has also met with a number of conspicuous failures in this field. The amphibious

operation which by itself had perhaps the greatest influence on the growth of the British Empire was the capture of Quebec by General Wolfe in 1759. The capture of Quebec led to the inclusion of Canada in the British Empire where it has remained since and still is the most important dominion in the British Commonwealth of Nations. Against this success during that era may be cited the failure of the British Fleet to come to the support of General Cornwallis at Yorktown in 1781, due to the fact that Admiral deGrasse with the French Fleet dominated the entrance to Chesapeake Bay for the short period of time necessary for Washington on land to force the surrender of Cornwallis. The failure of this amphibious operation on the part of the British led to the recognition by England of the independence of the American colonies. Both Quebec and Yorktown strikingly illustrate the principle that command of the sea is necessary to the success of such operations. The naval forces at Quebec consisting of some 140 ships provided control of the St. Lawrence to the British from the beginning of the operation early in June 1759 until its successful termination on the Plains of Abraham on September 13 of that year. The naval forces were under the command of Admiral Saunders. The heroic and spectacular death of General Wolfe during the battle of Quebec so over-shadowed every other aspect of this undertaking that only students of history know the name of the naval commander or realize the magnitude of the role which the sea forces played in the capture of Quebec. In more recent times, up to the Second World War, extensive amphibious operations were infrequent. Napoleon assembled a large fleet and a large army to invade England, but never undertook the invasion because of the difficulties involved in such an operation, and because of his inability to gain command of the sea. One of the most serious setbacks to the cause of the Allies in the First World War was the failure of the amphibious attack on Turkey at Gallipoli. The elaborately prepared raid on Dieppe during the Second World War failed because the techniques for aiding the offensive, which later came into use, had not yet been perfected.

Amphibious warfare played a very large part in the Second World War. The extent to which the four principal powers of the United Nations engaged in this type of warfare differed, however, very greatly. The warfare carried on by the United States during the Second World War was almost wholly amphibious in character especially in the Pacific. In the case of Great Britain, it became amphibious after the British Army was driven out of France at Dunkerque and remained so until France was reoccupied. On the other hand, amphibious operations played practically no part in the war carried on by Russia and by China, against the Axis powers. The reasons for this require no elaboration. In the case of both the United States and Great Britain, it was necessary to invade enemy-held territory in order to get at the enemy's ground forces. This involved landing operations on stubbornly defended beaches. Russia fought a purely land and air war, at first defensive in character and later offensive. China's preoccupation throughout the war was to resist the spread of invasion by Japanese forces, to protect her supply lines, and to loosen the hold of the enemy on her economic resources.

Amphibious warfare is the most difficult of all forms of warfare to wage successfully. It involves many elements that must be timed and co-ordinated exactly. Surprise in the initial assault is

usually essential but is very hard to achieve, especially in the case of operations of any magnitude. The most serious problem of the assaulting forces lies in overcoming the great natural advantages possessed by the defending forces in fighting from behind well protected positions of various forms, elaborately prepared in advance such as pillboxes, redoubts, trenches, caves, etc. The defensive has the advantage also of better artillery emplacements, easy ammunition supply, the use of mines and under-water obstacles of many kinds to obstruct actual landing operations and, as a rule, fewer logistic problems. The last mentioned frequently becomes the main problem of the offensive in amphibious operations. It may be said that, in general, the advantage lies decidedly with the defensive in amphibious warfare. Even before the entry of the United States into the Second World War it had been realized that any war in the Pacific would be largely amphibious in character. A program of research had, therefore, been started to develop devices and techniques that would neutralize some of the advantages of the defensive and would assist the assaulting forces in gaining a foothold on their objective without excessive casualties. Such research was stepped up intensively with the actual entry of the United States into the war.

The most elaborate and costly of all of the aids to amphibious warfare developed during the Second World War were the many types of craft, each serving its own special purpose, designed to land personnel and materials on hostile beaches. There were over one hundred different designs of such craft put into production, ranging in size from small boats and barges to large ships. Such craft were designated by letters and serial numbers instead of by names as is the normal custom in the case of naval vessels. The term "landing craft" was generally applied to nonocean-going vessels of less than two hundred feet length over-all, designed for use in landing operations. The designation LC followed by a letter to still further describe its purpose, was adopted to identify each type. For example, a vessel of this kind for ferrying tanks from cargo ships to the beach was designated as an LCT (Landing Craft Tank). Ocean-going vessels over two hundred feet in length, specifically designed for landing operations were designated as LS (Landing Ships) with a letter added to describe its special use. For example, an LSI is a landing ship for carrying infantry. Both of these categories of vessels were designed for grounding on the beach. They have large bow ports closed by ramps which are let down for discharging personnel and cargo. Their underwater shapes, especially at the stern, and their rudders and propellers are such as to facilitate backing off the beach.

A third type of landing craft represents an even more radical departure from the conventional, namely, the landing vehicle. These are true amphibians capable of operating in the water as well as on land. A standard automobile truck power plant and chassis formed the basis of the design. A watertight body was developed to provide for operation afloat. Two main types were developed, one fitted with a propeller and standard rubber tired truck wheels, and the other a tracked vehicle with the treads of the tracks acting as paddles to drive the vehicle through the water. The propeller driven type is known as the DUKW and was developed for landing on sandy beaches having a hinterland of roads good enough for normal truck use. This vehicle was especially useful in the Normandy campaign. The

tracked type known as the LVT (Landing Vehicle Tracked) is especially adapted to operation in the Pacific, where the vehicle had to travel over sharp coral formations which would have destroyed rubber tires, and through swamps and lagoons back of the beaches. The great usefulness of these vehicles consisted in their ability to carry men and materials from ships lying many miles off shore, through the surf, up onto the beaches, and directly inland to unloading points. Although originally intended only for landing assault forces, they were found of tremendous value in keeping up a steady stream of ammunition and supplies in support of such forces.

Under the landing craft building program there were produced about 3,300 landing ships (LS category), 40,000 landing craft (LC category) mostly of the smaller sizes, such as 36- and 50-footers, and about 19,000 landing vehicles (LV category), in addition to the DUKW program. In spite of these numbers, astronomical by any previous standard, there were never enough such craft. A simple example will suffice to illustrate the requirements, in this respect, of a major amphibious operation. The beach area assigned to the American forces in the Normandy assault totaled about 10,000 yards in length. Provision had to be made for landing craft to touch down at H-hour, on this length of beach at 75 yard intervals, loaded with assault troops. This first wave had to be followed by wave after wave of additional craft to land troops and supplies. The British sector of about the same length made equivalent demands on such craft. Until regular port facilities were restored, months afterward, the landing craft, mostly the landing vehicles, continued to deliver on the average 30,000 tons of supplies and 30,000 troops to the beach every 24 hours.

Other weapons and devices were invented especially to meet the requirements of amphibious warfare. Among these were the developments in radar making it possible for ships to find their way at sea and to exact spots on distant shores at night and under all weather conditions. The ability to land exactly where planned was found to be imperative, but had always been one of the problems of amphibious operations. These developments freed navigation from the need of celestial observations, lighthouses and other aids to navigation. Range finding is also no longer dependent on daylight and on clear weather. The development of rockets and rocket launchers make it possible to deliver a great volume of high explosives on to beaches from small boats. The rocket having no recoil requires no heavy foundations like the cannon, and is, therefore, suitable for installation in small craft. Methods and devices were developed for locating and destroying underwater obstacles and mines placed there by the defending forces to obstruct the passage of boats. Demolition crews were specially trained in the technique of demolishing such obstacles. Long-range flame throwers were developed to attack pillboxes, caves and other hideouts back of the beaches.

On the command and tactical side, the harmonious integration in amphibious operation, not only between the forces of Allies, but also within and between the sea, land and air forces of each country is particularly important. As a general principle, during the Second World War all naval forces were placed under a naval commander of the nation that had the primary naval responsibility in the area of operations. For example, during the invasion of Normandy and in the

Mediterranean, the United States naval forces operated under British naval commanders, but the combined operation of all air, sea and land forces was under a United States commander in chief. In the Pacific, the British and Australian naval forces were under the operational control of a United States naval commander. The combined operations in the Pacific theater were under the command of a United States naval officer, and in the Southwest Pacific under a United States Army officer. In any specific amphibious operation, command of all forces engaged rests in the hands of the naval commander, until the troops have been put ashore and have established their command organization. At this point, the land force commander advises the naval commander that he has assumed command of the troops ashore.

The function of the navy in an amphibious operation falls into four main phases. During the approach phase the navy commands passage to the area of landings for the invasion forces, bombards shore batteries, landing beaches and supporting areas, conducts minesweeping operations and removes beach obstacles. Frequently, the bombing of landing beaches and shore defenses is a joint function of army and navy aircraft. In the landing phase the navy by employment of special landing craft, which have been briefly described above, puts the invasion forces and all their equipment ashore under cover of ships' guns and carrier aircraft. In the support phase, after the consolidation of the beachhead, the naval forces continue to provide artillery and air support to the forces ashore as long as they remain within range of ships' guns and until shore-based aviation can relieve aircraft carriers of the task of air support. In the supply phase, the navy must guarantee the security of supply lines of the invasion forces and must obstruct the enemy's efforts to reinforce his troops by sea. This, for example, was the main problem and mission of the navy in maintaining the American foothold on Guadalcanal during the early months following the assault operations.

Modern amphibious warfare demands a balanced fleet of aircraft carriers and the conventional types of naval ships in addition to the special types of landing craft already mentioned. This was found particularly true in the Second World War in the Pacific where the air coverage had to be provided for amphibious operations by carrierborne aircraft. There was no argument, especially in this theater, of carriers versus battleships as both were found to be essential. Such carrierborne aircraft had to control the air during landings and after landings until runways could be provided on shore. In the case of the amphibious operations in the European theater, shore-based aircraft largely performed these functions because of the close proximity of air bases. Attacks by Japanese suicide planes added a new problem to amphibious warfare during the Okinawa campaign in the spring and early summer of 1945, but despite the fact that 30 combatant ships were sunk and 223 were damaged by such attacks, there was no interruption in the complete control of the sea by the Allied naval forces.

Naval gunfire plays an important role in preparing the way for the assault troops in amphibious operations. The main batteries of battleships provide the only guns that are sufficiently powerful and accurate to knock out reinforced concrete pillboxes 8 to 10 feet thick and other similar gun emplacements such as make up the modern defense of beaches. After the initial bombardment

by heavy ships and support aircraft, the lighter ships move in. Just prior to sending in the first wave of assault troops, destroyers, gunboats and rocket ships lay down heavy barrages of fire. Ships and aircraft continue to give support as the troops advance inland from the beaches. It is considered that the risk of exposing ships is justifiable if the objective is sufficiently important, more especially when command of the sea is not in jeopardy. The Normandy landing was an especially convincing demonstration of the value of naval gunfire in support of amphibious undertakings particularly gunfire from battleships because of its power and accuracy.

The proportionate size of the land, sea and air forces needed for an amphibious operation depends largely on the distance of the operation from the nearest base of supplies or staging area. The largest operation of this kind during the Second World War, in point of numbers of troops and material landed, was the Normandy invasion during June 1944, but from the point of view of problems encountered it was not the most difficult operation of the war because it had the advantage of being based on England only about 50 miles away, whereas the operations in the Pacific were based on the United States some 6,000 miles away. During the 90 days from June 5 to Sept. 5, 1944, 2,086,000 Allied troops and 3,446,000 tons of stores were landed on the Normandy beachhead. About 2,500 naval ships and craft took part in this operation, most of them of the smaller sizes. This naval force was manned by about 124,000 naval personnel. Compared to this operation, the Lingayen Gulf operation of Jan. 9, 1945, in the Philippines is of interest. The naval attack and covering forces for this operation consisted of 1,033 ships, ranging in size from battleships and carriers on down through landing craft. The naval personnel in this force numbered upward of 273,000 men. The army forces put ashore on D-day and during the following four days were slightly more than two thirds of this number.

J. A. FURER,

Rear Admiral, U.S.N. (Retired).

ANATOLIA. See TURKEY.

ANDAMAN and NICOBAR ISLANDS. Two groups in the Bay of Bengal, together constituting a chief commissioner's province of British India. The province has an area of 3,143 square miles and a population (1941) of 33,935. The Andamans (2,508 square miles; pop., 21,483), 120 miles from Cape Negrais, Burma, consist of five large islands, collectively known as Great Andaman, and one small island to the south termed Little Andaman. The provincial capital is at Port Blair, finest of numerous good harbors. The Nicobars (635 square miles; pop., 12,452), 75 miles south of Little Andaman, consist of 19 islands divided into three groups; Car Nicobar, principal island of the northern group, contains the headquarters of an assistant commissioner. Coconuts and rubber are cultivated on the Andamans, and coconuts on the Nicobars. A penal settlement for convicts from India was established in the Andamans in 1858. It has now been abolished and on Sept. 1, 1945, the government of India announced a program for the Andaman and Nicobar Islands which included development of timber production, expansion of agricultural resources, and exploitation of the fisheries, this last to include establishment of a shark oil industry. The islands were occupied by Japanese forces in June 1942 and, although shelled and

bombed from time to time, remained in their possession until conclusion of hostilities.

ANDERSON, Clinton Presba, United States Cabinet member: b. Centerville, S. Dak., Oct. 23, 1895. Mr. Anderson was appointed Secretary of Agriculture in the Truman Cabinet, effective July 1, 1945, to succeed Claude Wickard. Prior to his appointment, he was one of New Mexico's two representatives-at-large in the 77th, 78th, and 79th sessions of the United States Congress; chairman of the special House committee studying problems of the nation's food shortages (79th Congress); chairman of the House committee to investigate campaign expenditures (78th Congress); and member of the House Ways and Means Committee.

Mr. Anderson was educated at Dakota Wesleyan University, 1913-15, and the University of Michigan, 1915-16. From 1918-22, he did newspaper work in Albuquerque, N. Mex. He was New Mexico's treasurer, 1933-34, and in 1935-36, directed the state's rural rehabilitation and relief. In 1936-38, he was chairman and executive director of the Unemployment Compensation Commission, and in 1939-40, managing director of the Coronado Exposition Commission. He entered Congress in 1941.

ANDORRA, ăn-dŏr'ă, a republic in a valley of the Pyrenees under the joint suzerainty of France and the Spanish Bishop of Urgel, to each of which an annual tribute of 960 francs and 460 pesetas, respectively, is made. The area is 191 square miles and the population about 5,231, scattered in some six villages. The capital, Andorra la Vieille (Andorra Vicella) has a population of about 700. Since 1278 Andorra has enjoyed undisturbed sovereignty and was granted a constitution as a republic by Napoleon in 1806. It is governed by a council general. The council is presided over by an official called the first syndic, who exercises the executive power. A second syndic serves as deputy of the first syndic. In 1941 universal male suffrage was abolished and the right of suffrage restricted to heads of families. In civil matters the judicial power is exercised in the first instance by two civil justices normally appointed jointly by the Bishop of Urgel and by the French government. The higher courts consist of a judge of appeal, a Supreme Court (held at Perpignan) and an Ecclesiastical Court, of the bishop, at Urgel. A permanent delegate, the prefect of the Pyrénées Orientales, is in charge of French interests and public services, established by France, such as education, posts, and telegraphs. An excellent motor road crosses the country, connecting the Spanish and French frontiers. The inhabitants speak Catalan and are chiefly Roman Catholics. Sheep raising is the principal industry, grains, tobacco, wine, iron, and lead also being produced. On Nov. 14, 1944, Andorra was occupied, for security reasons, by French gendarmes under the authority of General de Gaulle, as its ex-officio co-ruler.

ANGLO-AMERICAN CARIBBEAN COMMISSION.

A joint organization to facilitate co-operation in matters of common concern in the Caribbean area. As announced on March 9, 1942, by the United States and British governments, it was created in the first instance as a war measure to co-ordinate research and to advise the appropriate agencies of the two countries responsible for administrative action. The membership of the commission was increased in June 1945 from six to

eight, four members from each country, two of the British representatives being unofficial West Indians. The co-chairmen are Charles William Taussig for the United States and Sir John Stuart Macpherson for Great Britain, the latter succeeding Sir Frank Arthur Stockdale in 1945. The secretariat, with co-secretaries, is in Washington, D.C. The United States section of the commission has been included in the Caribbean Office of the Department of State; and the British co-chairman, who is also Comptroller for Development and Welfare in the West Indies, has his headquarters in Jamaica. The scope of the commission's activities is not restricted to territories under the American and British flags, other countries in the area being invited to participate. The Caribbean Research Council, an advisory body formed in 1943, was established on a permanent basis on March 1, 1945, with headquarters and a central secretariat in the Caribbean area, the membership numbering not more than 15 and not less than seven. The council is divided into five committees, namely, public health and medicine; industries; building and engineering research; social sciences; and agriculture, nutrition, fisheries, and forestry. A second advisory body, the West Indian Conference, was formed in 1944 to provide a channel for the discussion and formulation of plans for co-operation; the membership comprises two delegates from each United States territory and each British colony in the Caribbean. The conference met for the first time on March 21-30, 1944, in Barbados, being attended by delegates and advisers from the Bahamas, Barbados, British Guiana, British Honduras, Jamaica, Leeward Islands, Puerto Rico, Trinidad, Virgin Islands of the United States, and Windward Islands; subjects discussed embraced local food production, expansion of fisheries, re-absorption of labor into civil life, planning of public works, health protection and quarantine, and industrial development.

ANGLO-EGYPTIAN SUDAN. A condominium in Africa extending southward from Egypt as far the borders of the Belgian Congo, Uganda Protectorate, and Kenya Colony; it is bounded on the east by Eritrea and Ethiopia, and on the west by Libya and French Equatorial Africa. The area is 967,500 square miles, and the population is estimated at 6,590,996, of whom 44,496 are non-natives. Geographically and culturally the Anglo-Egyptian Sudan falls into two parts: north from lat. 12° N. lies steppe and desert country; and south of that line, and separated from it for the most part by swamp and river, is the Sudan proper, "the Country of the Blacks." The capital is Khartoum (pop. 44,950), and other towns include Omdurman (104,513), capital under the earlier Dervish rule, and Port Sudan (21,535), located on the Red Sea.

Government.—A governor general (Lieut. Gen. Sir Hubert Jervaise Huddleston appointed Oct. 16, 1940) named by Egypt with British assent, administers the eight provinces into which the country is divided through provincial governors, under whom tribal sheikhs have been given increasing powers of self-government; natives administer the municipalities, townships, and rural areas of the Sudan, and preside over the Sharia (Mohammedan religious) courts and the lower civil and criminal courts.

Finance.—The central government obtains its revenue from direct taxation, royalties, and customs, and from profits derived from the railways, postal, and telegraph services, all owned and op-

erated by the state. In 1943 revenue amounted to £E5,861,944, and expenditure was £E5,801,790. These figures do not include revenue and expenditure in 11 rural areas, where native authorities have considerable financial authority. Their combined budgets in 1942 amounted to £E202,566 (revenue, £E110,594; expenditure, £E91,972).

Education.—In the northern sphere of the country most of the schools are owned and operated by the government, and in the southern portion are mission schools which, to a considerable extent, are in receipt of state grants. Separate elementary and intermediate schools are provided for boys and girls; in the northern sphere, in 1942, there were 186 schools of both categories, public and private, with 33,551 pupils, and in addition some 20,000 boys received an elementary education in religious (Koranic) schools subsidized by the government. There were 63 schools up to intermediate standard in the southern sphere in 1942, and some 450 "bush" schools giving rudimentary instruction. Boys are trained as builders, carpenters, painters, fitters, and blacksmiths, and for the public health, railway, and other departments of the government; and girls are trained as nurses and midwives. Gordon Memorial College, Khartoum, developed as a secondary school under government control, was given in 1945 an independent governing body to promote its expansion into a future University College of the Sudan; as a first step, the higher schools of art, science, and engineering were unified with the institution in February 1945. The diploma of the Kitchener School of Medicine, which has been functioning for 21 years, has been given partial recognition by the Royal Colleges of Medicine and Surgery in Great Britain; its qualified doctors find employment in the Sudan Medical Service, many holding responsible administrative, specialist, and research posts.

Production.—The Sudan supplies 80 per cent of the world's needs for gum arabic. The principal grain crop is durra (millet), and beans, corn (maize), peanuts, sesame, chillies, and dates are also cultivated. Soya beans were planted for the first time in 1944. The principal commercial crop is cotton, cultivated by irrigation in the Gezira, between the Blue and White Nile rivers. Production in 1944-45 was a record for at least the past 20 years—206,578 feddans yielding 4,959 kantars per acre. On a partnership basis, the government guaranteed loans amounting to over £E11,500,000, and supplied the water, main canalization, and scientific research; the Sudan Plantations Syndicate supplied skilled supervision and marketed the crops; and the cultivator supplied the labor and, to an increasing extent, is associated through local boards with supervision and administration. The government and the cultivator take equal shares of 80 per cent of the profits, and the Syndicate gets the remaining 20 per cent. In 1945 the government served notice that it would terminate the concession of the Sudan Plantations Syndicate in 1950, when the Gezira fields are to be nationalized. Cotton is also grown on the Gash and Baraka deltas, and American long-staple is produced in the northern sphere under irrigation and in the southern sphere as a rain crop. The total area under cotton in 1941-42 was 401,546 acres, and the crop totaled 295,107 bales of 400 pounds each.

Much damage has been done to native crops in southern Sudan by herds of elephants, and in 1944 professional white hunters were engaged from Uganda to help reduce the numbers. Peri-

odically, locusts are also destructive. In Darfur province, in 1945, four *dambaris* (locust charm-ers) surrounded a large swarm of flying locusts to prevent them damaging the native crops. The locusts, unable either to escape by flight or to settle on the ground, remained stationary in the sky until, according to an unconfirmed report, American pilots, by some secret device, succeeded in bursting them in mid-air.

Forests in the north are limited in extent, and constantly threatened with encroachments of the desert. The mesquite tree has been successfully introduced from the United States; it has proved a valuable antierosive agent in semidesert conditions and, in addition, it provides highly nutritive fodder for cattle and an edible flour for human consumption. During the war, *podocarpus*, a soft tropical wood, was cut on the mountain slopes near Uganda and transported to the markets farther north. Camels are inoculated against trypanosomiasis, and cattle against rinderpests and pleuropneumonia. In 1942, exports of cattle amounted to 50,937, and of sheep to 153,943; and hides, skins, and ghee (clarified butter) were also exported in considerable quantity. Gold is mined at Gabait, on the Red Sea, and industries developed during the war include tanning, glass-making, and the manufacture of perfume, buttons, and tomato-juice.

Defense.—Since Egyptian troops were withdrawn from the condominium in 1924, the country has been garrisoned by the Sudan Defense Force, of natives under Sudanese and British officers. Aided by Sudan Police and three battalions of British infantry, for four months during 1940 the S.D.F. held 1,000 miles of frontier against Italian-led troops who attempted to invade the Sudan from Eritrea and Ethiopia. In March 1945 a detachment of officers and men of the Saudi Arabian Army arrived at Khartoum for training with the S.D.F.

Communications.—The Sudan Railway, a government undertaking, runs southward from Wadi Halfa, on the Egyptian frontier, as far as Jebel-lein, south of Khartoum, a branch westward from Abu Hamed going to Kareima. From Atbara, there is also a line eastward to the Red Sea at Port Sudan and Suakin; and from Haiya, on that line, a railroad runs to Kassala (whence a spur into Eritrea was built during the war), and continues through Sennar, on the Blue Nile, to join the main line again at Khartoum. The railroads had a total length of 1,991 miles prior to the war. Magnificent harbor works have equipped Port Sudan with the finest quay-side and fueling facilities between Port Said and Singapore. Government-operated passenger steamers proceed up the Nile from Jebel-lein to Wantiak, a river port constructed during the war, whence is an all-weather road to Juba (the former steamer terminus), where connection is made with the Belgian Congo and Uganda transportation systems. Including other services on the Nile and its tributaries, there are 2,325 route miles of river transport operated by the government. Several airfields constructed during the war supplement those previously existing along the course of the Nile.

ANTARCTICA. South circumpolar continent lying almost entirely within the Antarctic Circle

and surrounded by the Antarctic Ocean. In winter its surrounding waters are frozen over, and in summer they are strewn with drift ice. The continent itself, covered for the most part with an ice sheet hundreds of feet thick, and swept by polar winds, has an area of more than 5,000,000 square miles. Its longest axis—which passes near the South Pole—is 3,630 miles. It has a high mean elevation—6,000 feet above sea level—the elevation at the Pole, which is situated on a wide plateau, being 9,070 feet. Life found in the region is confined to certain marine animals, birds, and nonflowering plants. Various countries have asserted claims to portions of Antarctica—the United States, Germany, Chile, and Argentina being the principal claimants.

ANTHROPOLOGY. Wartime inhibition of field research in anthropology encouraged the re-examination of discarded concepts. In part this may have been favored by the passing of the older generation of anthropologists and the maturing of the younger group. For example V. Gordon Childe, the distinguished English prehistoric archaeologist, in his Huxley Memorial Lecture for 1944, reconsidered the old basic concepts of Stone Age, Bronze Age and the Iron Age as defining world horizons in culture. The American School of 1900 vigorously reacted against the general validity of these concepts except within the narrow confines of Western Europe, but Childe calls attention to the wealth of new data and the discovery of many localized chronological sequences, independent of absolute cross-dating, whence we are justified in treating sequences as relative. Thus we may find instances of bronze following an age of stone in non-contemporary horizons, to be followed in turn by the use of iron, whence the order of sequence becomes a reality. Once such sequences appear to be relative, it becomes more difficult to deny that there is such a phenomenon as culture evolution. Further, it may follow that the relatively contemporary appearances of pottery, agriculture and the domestication of animals are not fortuitous events as often claimed, but closely correlated steps in culture evolution. Dr. Childe cites a number of tool sequences which appear to have several localized distributions not strictly contemporary in historical chronology. A somewhat similar critical evolution of technological sequences is suggested in Linton's discussion of pottery types and their distribution, which he believes best interpreted as indicating the independent evolution of pottery in several areas instead of wholesale distribution from a single center of origin. (*American Antiquity*, 1944.)

Geographers have given unusual attention to culture and chronological problems. Special emphasis has been placed upon plant distribution. A discussion led by Cleland has contended that the native flora of Australia rendered the evolution of civilization impossible in that area, since neither a potential wild cereal nor root plant was available. Likewise, the fauna offered no encouragement to the domestication of animals. The native Blacks displayed sufficient intelligence to have taken advantage of such opportunities had they existed. Turning to the general subject of plant utilization, three papers deserve notice as attempts in scientific synthesis in human ecology: (1) D. Whittlesey, "The Horizon of Geography," in the *Annals of the Association of American Geographers*, 1945; (2) C. O. Sauer, "A Geographic Sketch of Early Man in America," *Geographic Review*, 1944; (3) G. F. Caster, "Plant Geography

and Culture History in the American Southwest," *Anthropology*, 1945.

The first paper proposes that the evolution of culture was intensively accelerated by the final circumnavigation of the world and the accumulation of sufficient geographical knowledge to comprehend the world as a whole. This knowledge was utilized by European peoples in their competitive struggle for the exploitation of the non-European world and its natural resources. A further proposal is that the time has come when every war will be a world war, followed by increased standardization in ways of living. The second paper deals with the natural distribution of the American wild flora, the changes in the distribution produced by man, as possible causal factors in some of these transformations, for example the creation of the great grassland area in middle United States by burning off the original forest cover. The third publication is a synthetic review of the data on plant utilization so far accumulated, pointing to the dawn of a new scientific horizon on which we shall be able to reconstruct the history of culture in terms of agronomy and animal industry. Tentative reconstructions are proposed which incline one to believe that agriculture in the New World, for example, may well be as ancient as agriculture in the Old World.

Some published data and interpretations by the late Aleš Hrdlička suggest that the Aleutian chain of islands was first inhabited by a people resembling certain surviving North American Indian tribes. This population was fairly homogeneous anatomically and culturally and its period of occupation relatively long. It was rather long headed, suggesting to Hrdlička later Siouan and Algonkin types. As to time relations, Hrdlička, always reluctant to believe any human occupation of America more remote than 2,000 years, suggests very late B. C. dates, even though the lowest levels in midden refuse excavated by him rested upon virgin glacial deposits of boulders and sand. Further, the successive layers of refuse indicated marked changes in post-glacial climate during the period of occupation; in all, pointing to a greater antiquity than Dr. Hrdlička was willing to accept. However, the significant finding is that before the Russians began to trade in the islands, the ancestors of the historic Aleuts spread over the same territory, displacing the earlier population. Hrdlička proposes that the pre-Aleuts resemble Tungus Siberian tribes, whereas the Aleuts seem closely affiliated with the Eskimo and are assumed to have entered the Aleutian chain from Alaska. Observations recently reported by military and naval observers all seem consistent with this concept of a pre-Aleut people, so we seem justified in noting this definite contribution to the archaeology of Arctic America.

An important contribution to American Indian Linguistics was the publication of a new map of North American Language Stocks, compiled by C. F. and E. W. Voegelin, Indiana University. The text upon which this new map is based forms a chapter in *Language, Culture and Personality*, Menasha, Wisconsin, 1941. The original list of families in the Powell classification is recognized, but these are presented as constituting six super-families, or groups, based upon structural resemblances between the recognized families. The distributions of these six groups reveal dominant geographical blocks, suggesting as many main centers of differentiation. The most consistently segregated groups are the Eskimo and the Algonkin-Salish clusters. The other super-groups show

large contiguous geographical distributions with small, scattering, outlying, more or less isolated families. The tendency to consolidated distributions supports the genetic interpretation accorded to the super-family grouping.

Several years ago we announced in these annual summaries of progress in anthropology the Swedish discovery of a chemical technique applicable to the locating of archaeological sites. Now Professor Bray, University of Illinois, has tested this method and recommends it to field workers in America. Excessive amounts of phosphorus in the soil indicates human habitation sites, historical and ancient, and the quantity of this substance is an index of size and length of occupation at the place.

The reader may be advised that each year T. F. McIlwraith issues an annotated bibliography of ethnology, anthropology and archaeology, published in the *Canadian Historical Review*. These lists were begun in 1925 and have continued until the present, thus comprising an accumulative index of the literature of our subject.

ANTIGUA. See LEEWARD ISLANDS (B.W.I.).

ANTIMONY. Domestic production of antimony ore in 1944 decreased 20 per cent below the 1943 output, the total metal content of the ore declining 15 per cent, according to the United States Bureau of Mines. Primary antimony raw materials were consumed by producers of the intermediate products, antimony metal, oxide, sulphide, and by manufacturers of finished metal and nonmetal products; the two groups in 1944 used 22,675 short tons (antimony content) of antimony ore, 4 per cent less than the 23,505 tons in 1943. Only 45 per cent (10,163 tons) of the total consumed was from mixed or oxide ore—mostly from Mexico—as compared with 56 per cent (13,224 tons) in 1943. Nine plants consumed 22,000 tons of antimony in raw materials, including 19,000 tons in ores and concentrates, and produced antimony metal, oxide, and sulphide containing 20,000 tons of antimony, slightly less than the output in 1943. Flame-proofing of canvas for military uses such as tents, tarpaulins, camouflage netting, life preservers, and the like continued to be the largest end use for antimony, using 7,063 short tons of contained antimony in 1944.

APPLES. In many respects and especially in certain sections of the country, the 1945 apple crop of the United States was close to a failure. Only in the Western states did production hold up to something close to normal. Throughout other sections of the Union, the yield dropped from as much as one half to but little over one fourth the normal crop. In the North Atlantic states the 1945 crop dropped from a ten-year average (1934-43) of 33,747,000 bushels and a 1944 crop of 34,941,000 bushels to 8,308,000 bushels. In New York alone the drop was from 17,010,000 bushels in 1944 and a ten-year average of 15,887,000 bushels to 2,700,000 bushels. In the South Atlantic states the drop was from 23,451,000 bushels in 1944 and from the ten-year average crop of 18,978,000 bushels to 6,354,000 bushels in 1945. In the North Central states the drop was from 18,891,000 bushels in 1944 and the 1934-43 average crop of 20,825,000 bushels to 7,920,000 bushels in 1945. In the South Cen-

tral states production dropped from an average crop of 1,342,000 bushels and a 1944 crop of 1,104,000 bushels to 979,000 bushels in 1945. However, in the Western states the drop was very slight: from an average crop of 44,153,000 bushels and a 1944 crop of 46,367,000 bushels to a 1945 crop of 43,193,000 bushels. Virginia, the second Southern state in production, like New York, was hard hit, her crop dropping from 14,580,000 bushels in 1944 and an average crop of 10,903,000 bushels to 3,330,000 bushels in 1945. A late freeze was responsible for most of the damage throughout the Eastern states. The country's total crop, in bushels, was as follows: 1945, 66,754,000; 1944, 124,754,000; 1934-43 average, 119,046,000. Washington, now the leading producing state, had a 1945 crop of 26,180,000 bushels, a drop from 31,100,000 bushels in 1944. California went into second place in 1945 with 9,240,000 bushels against 6,144,000 bushels in 1944, while Virginia took third place with the crop referred to above.

APRICOTS. The Department of Agriculture estimated the 1945 United States crop of apricots at 211,600 tons, as compared with the 1944 crop of 854,900 tons and the 1934-43 average crop of 215,415 tons. Commercial production is reported for only the three states of California, Washington and Utah. California is by far the leading producing state, being credited with 177,000 tons in 1945, 324,000 tons in 1944, and a ten-year average crop of 197,700 tons.

AQUEDUCTS. See **TUNNELS**.

ARAB LEAGUE, The. A regional bloc in the Middle East, constituted to safeguard the common interests of signatory monarchies and republics whose inhabitants were predominantly of Arab stock and Moslem in religion. Conscious of dangers lurking in separatism, these countries had been drawn together during the war by ties of blood, however diluted, of language, and religion. Threatened submergence of the Arab majority in Palestine by an influx of Jews and newly-awakened foreign interest in Arabia because of its petroleum deposits formed the background of the unity movement spurring the Arabs into preliminary talks in the fall of 1943. These were carried a stage further in September-October 1944, when representatives of Arab states met in Alexandria, Egypt, to draw up tentative plans for a permanent federation analogous to that of the Pan American Union. Discussion was resumed in Cairo on Feb. 14, 1945, and the outcome was adoption on March 22 of the charter of the Arab League. The constitution, consisting of 22 articles, stated, *inter alia*, that the league's aim was to promote co-operation among member states, particularly in matters of culture, trade, and communications, and to settle questions of passports and nationality among its members; the use of force to settle disputes was forbidden; if a dispute between members was arbitrated by the league, the latter's decision must be accepted as final and binding; treaties and alliances concluded by member states must be deposited with the league; states may withdraw from the league at any time, or may be expelled by unanimous vote of the other members.

The first members of the organization were Egypt, Iraq, Lebanon, Saudi Arabia, Syria, Trans-Jordan, and Yemen. While Palestine, as a British mandate, was not accepted as a full and equal member, she was admitted to the league's deliberations and, by Article XXI of the charter, given

a vote in the decisions of the council. Lebanon was the only state whose inhabitants, although Arabic in race, were predominantly Christian in religion; and Trans-Jordan and Yemen were the only two who were not members of the United Nations Conference for International Organization held in San Francisco in the spring of 1945. These seven states covered an area of some 1,500,000 square miles, and their combined populations totaled 33,000,000. Since, with the exception of Lebanon, the member-states of the Arab League were overwhelmingly Moslem in religion, and within their borders lay most of the Islamic Holy Places, the influence of their organization was bound to extend far beyond its membership. The world's 250 million Moslems include 90 million in India, 48 million in China, 20 million in Soviet Russia, and other millions in south-eastern Europe, north, west, and east Africa, the East Indies, and the Philippines. It is against this vast background of religious ties that the important problems of the Moslems, as now voiced by the Arab League, will have to be viewed.

On May 1, 1945, with the express purpose of presenting a united front, the five states who were members of UNCIO officially deposited a copy of the constitution of the Arab League with the secretariat of the new world body, shortly thereafter known as The United Nations. The Arab League soon was called upon to assume a position in the dispute between France and the republics of Syria and Lebanon, where fighting had broken out on the issue of unfettered independence. During June 4-11, 1945, the council of the league met in Cairo, where it discussed measures to be taken to support the demands of its member-states, and expressed gratitude to Great Britain for her intervention in the interests of the Arabs. Beyond the confines of the council body discussions were also proceeding, at this time, for expansion of the Arab League into a larger non-Arab federation in the Middle East where Jews and Christians might take their place with the Moslems. In order that the Arab point of view might be presented more fully before western opinion, during 1945 the governments of the states constituting the Arab League opened an Arab Office in London and a second one in Washington. The league council met in Cairo once more in November, mainly to concert measures for countering the campaign for further Jewish immigration into Palestine (q.v.); on Dec. 3, 1945, it was announced that the seven member states intended, with effect from the first of the new year, to boycott all Palestinian goods produced by Jews.

ARABIA. A peninsula in southeastern Asia, bounded northeast by the Persian Gulf and the Gulf of Oman, southeast by the Indian Ocean and the Gulf of Aden, and southwest by the Red Sea and the Gulf of Aqaba; on the north it is bounded by Iraq and Trans-Jordan. The total area is rather more than 1,000,000 square miles, and the population is estimated to exceed 9,000,000. Saudi Arabia and Yemen are wholly independent states; all other territories in Arabia are under British control in varying degrees, namely Aden and Aden Protectorate, Oman (or Muscat and Oman), Trucial Oman, Qatar, Bahrain, and Kuwait. The foregoing are treated below. Countries outside the peninsula with predominantly Arab populations are Egypt, Iraq, Lebanon, Palestine, Syria, and Trans-Jordan (qq.v.)

Saudi Arabia.—A kingdom having a long coastline down the Red Sea and a shorter one on the Persian Gulf. The area is 721,000 square miles, and the population is estimated at 4,500,000. The kingdom comprises Nejd (area, including Hasa, 557,000 square miles; pop. 3,000,000) and Hejaz (area, including Asir, 164,000 square miles; pop. 1,500,000), each with a distinct system of government; the capital of Nejd Riyadh (pop. 30,000), and that of Hejaz is Mecca (pop. 80,000). King Ibn Saud conquered Nejd, Hejaz, and Hasa during and after the First World War and organized the kingdom in 1932, adding Asir two years later. Amir Saud, eldest son of the king, administers Nejd, and Amir Faisal, the second son, is governor of Hejaz; administration of Nejd is patriarchal, while Hejaz has a constitution providing for a Council of Ministers subject to the governor's wishes. Foreign diplomatic and commercial representatives have their headquarters at Jidda (pop. 30,000), on the Red Sea. Mecca and Medina (pop. 30,000) are the Holy Places of Islam; the provincial capital of Hasa is Hofuf (pop. 30,000); and Sabiya (pop. 20,000) is the capital of Asir province.

Saudi Arabia produces cereals, fruits, wool, tobacco, sugar cane, clarified butter, dates, sorghums, and vegetables, and raises camels, horses, donkeys, sheep, and goats. Coffee is cultivated in Asir. Copper and brass cooking utensils are manufactured at several places, and at Mecca, a type of dagger, black coral prayer beads, and silver and gold filagree ornaments; Arab robes ("mesh-las") are made at Hofuf and elsewhere, as well as tents and carpets from woven sheep wool and camel or goat hair. Copper, gold, and silver are mined by American companies in the northwestern area of the kingdom, but the most important enterprise in the country is the production of petroleum. In Hasa, on the Persian Gulf, are oil reserves which have been proved at five billion barrels and may amount to 20 billion; only the United States and Iran have greater known reserves of petroleum. Oil was first located, at Dammam, in 1935, and in 1939 the Arabian American Oil Company ("Aramco"), a joint interest of the Standard Oil Company of California and The Texas Oil Company, obtained a concession for 450,000 square miles; besides the installations at Dammam, oilfields were developed at Abu Hadriya, Qatif, and Abqaiq, and refineries at Ras Tanura, a deep-water port, with a 50,000-barrel daily capacity were completed in 1945. Headquarters of "Aramco" are at Dhahran. King Ibn Saud is paid a royalty of four gold shillings for each ton of oil extracted. Plans for construction of a pipeline more than 1,000 miles in length from the oilfields to the Mediterranean were under consideration in 1945. Possible Mediterranean outlets were Tripoli or Saida, in Lebanon; Haifa or Gaza, in Palestine; El Arish, Port Said, or Alexandria, in Egypt; but political factors would undoubtedly control the decision.

Exports of minerals and petroleum products are of prime economic importance; lesser exports include charcoal, clarified butter, dates, hides, honey, salt, and tobacco. Besides much mining equipment, imports comprise automobiles, foodstuffs, textiles, household hardware, light structural steel, and cement. Though Saudi Arabia has its own silver coin, the riyal, equal in value to the Indian rupee, the British gold sovereign is the basis of the kingdom's currency. There are few modern highways, motor traffic and camels making use of the many tracks across the country. The principal centers are served by good radio

telecommunications, and air services link the country with the outside world.

In 1945 Ibn Saud aligned his country with its neighbors as a member of the Arab League (q.v.), Saudi Arabia's delegate signing the final draft of that body's constitution on March 22. The kingdom also declared war against Germany and Japan on Feb. 28, 1945, though excluding the zone of the Holy Places of Islam. Thus Saudi Arabia qualified for representation at the United Nations Conference for International Organization, and on April 12 her minister in Washington signed the Declaration of the United Nations.

Yemen.—An independent imamate lying between the Asir province of Saudi Arabia and Aden Protectorate; it has an estimated area of some 75,000 square miles, including several semi-independent districts, and a population of about 3,500,000. The Imam is Yahya Muhammad Hamid ed Din. Yemen contains some of the most fertile sections of Arabia, producing—in the highlands—wheat, barley, alfalfa, grapes, figs, and other fruits and vegetables; in the coastal plain of the Tihama and adjoining valleys—dates, sorghums, corn, tobacco, sesame, senna, indigo and vegetables; and on the terraced western mountain slopes, at altitudes of between 3,500 and 6,800 feet—the world-famed Mocha coffee, and "kat or khat," a narcotic plant which rivals coffee in value. The principal towns are San'a (the capital), a walled city with eight gates and a population of between 20,000 and 25,000; Dhahmar, and Taciz (Ta'izz), the principal seaports are Hodeida (Hodeda, Hadedda) (40,000), and Mocha (Mokha).

Aden.—The British colony of Aden, and Aden Protectorate, are in the southwestern portion of the peninsula, bordering on the Gulf of Aden. The combined area is about 112,000 square miles, of which only 75 square miles constitutes the colony. The population is estimated to amount to 600,000, of whom 65,000 reside within the colony; the port of Aden has 48,000 inhabitants. The seaport has a large transshipment trade, and is an important naval base and fueling point for commercial vessels. Besides mainland territory, the colony includes the islands of Perim (5 square miles) and Kamaran (22 square miles) and the Kuria Muria islands (30 square miles). The governor is Reginald Stuart Champion, appointed Dec. 15, 1944. Revenue in 1943-44 amounted to Rs.11,623,347, and expenditure was Rs. 4,695,466. There were 65 schools in the colony in 1944, some of them conducted or partially supported by the government. The principal exports comprise coffee, gums, hides and skins, opopanax oil, and salt, while the chief imports are coal, cotton textiles, foodstuffs, and fuel oil.

Aden Protectorate, controlled by the governor of the colony though not directly administered, consists of western and eastern groups of territories: the former comprises 19 sultanates; and the eastern portion contains the Hadhramaut (within which are two Arab states), three sultanates, and two sheikhdoms. Butter, dates, fish, gums, honey, and tobacco are the principal products. Lack of rains caused a complete failure of the scanty agricultural crops due to be harvested in February 1945, with the result that a severe famine ensued. Besides camels, the livestock comprises sheep, humpless cattle, and goats.

Oman, or Muscat and Oman.—A sultanate in treaty relationship with the government of India, is situated on the southeastern corner of the Arabian peninsula. The area is 82,000 square miles,

and the population is estimated to amount to 500,000. Muscat (pop. 4,200), the capital, contains the palace of the sultan (Sir Saiyid Said bin Taimur succeeded in 1932); Matrah (pop. 8,500), 3 miles north of the capital, is an important commercial center. Dates are the chief agricultural product, and camel raising the principal animal industry. Besides dates, dried fish, fresh and dried limes, and pomegranates are exported; coffee, rice, and sugar are the main imports. In addition to its own copper piece, known as the baiza, the Maria Theresa dollar is current in Oman; however, the legal currency is the Indian rupee, which circulates in the coastal districts. The larger towns are connected by motor roads; elsewhere camels and donkeys are used for purposes of transportation.

Trucial Oman.—Extending for about 400 miles along the south end of the Persian Gulf, Trucial Oman comprises the domains of seven sheikhs who have agreed not to enter into relations with, or cede territory to, any other Power than the British. The sheikhdoms (Abu Dhabi, Ajman, Debai, Kalba, Ras al Khaimah, Shargah, and Umm ul Qawain) have an aggregate area of 6,000 square miles and a population estimated to amount to 80,000; Sharja (pop. 5,000) is the capital. The British government is represented in Trucial Oman (also termed the "Trucial States") by a Political Officer and a Residency Agent who are subject to the Political Resident in the Persian Gulf (Lieut. Col. Sir Geoffrey Prior). Dates and grain crops, particularly sorghum, are cultivated; fisheries along the coasts yield a high grade of pearl. Surveys have failed to disclose evidence of petroleum deposits. Abu Dhabi and Debai are the principal ports.

Qatar.—A sheikhdom on the Persian Gulf north of Trucial Oman, and in like treaty relationship with Great Britain. The area is 6,000 square miles, and the Sheikh (Abdullah ibn Jassim al Thani succeeded in 1913) has his residence at Dohar (pop. 5,000), the capital. Dates are cultivated and stock is raised, while in the interior vegetables are grown by irrigation from wells. Pearl diving is the principal industry on the coast. American and European oil interests obtained a concession in 1935 to seek petroleum deposits. Two wells commenced commercial production in 1941, this being an undertaking of the British-owned Iraq Petroleum Company, a quarter interest in which is shared by the Standard Oil Company of New Jersey and the Socony-Vacuum Company. There are indicated reserves of one billion barrels of petroleum.

Bahrain.—A sheikhdom under British protection comprising an archipelago in the Persian Gulf within 20 miles of the Saudi Arabian mainland province of Hasa. The principal islands are Bahrain, Muharra, Sitra, Hawar, Umm Nasan, Jidda, and Umm A'Sabaan; the total area of the sheikhdom is 270 square miles, and the population is estimated to number 120,000. Manama (pop. 40,000), the capital, is on Bahrain Island, which is linked with the neighboring island of Muharra by a causeway and swing bridge. The Sheikh (Sulman, succeeded Feb. 3, 1942) has for his principal adviser an Englishman, C. Dalrymple Belgrave, chief of the police and magistracy; the British Political Agent is E. B. Wakefield. Pearl-oysters have long been plentiful in the waters of the archipelago, center of the famous pearl fishing industry of the Persian Gulf, but the pearl market has shown decline in recent years. Other industries are boat building, date cultivation, manufacture of sailcloth and reed

mats, and the breeding of white donkeys. The petroleum industry is of greatest economic importance. Oil was first found in 1932, and has been produced since then by the Bahrain Petroleum Company, jointly owned by the Standard Oil Company of California and The Texas Oil Company (which also own "Aramco," of Saudi Arabia); the headquarters of the oil company is at Manama. The capacity of the refinery was increased to 58,000 barrels daily in 1945. Royalties on oil production constitute the sheikhdom's main revenue. While the Indian rupee is the legal currency, the Maria Theresa dollar and the Turkish lira are also in circulation.

Kuwait.—An independent sheikhdom under British protection, lies at the head of the Persian Gulf, between Iraq and Saudi Arabia, with small neutral zones to the south and west. The area is 1,950 square miles, and the population is estimated to amount to 60,000; the capital is Al Kuwait (pop. 25,000). The Sheikh (Sir Ahmad al Jabir al Subah, succeeded Feb. 23, 1921) is assisted in administration by an advisory council composed of 14 chiefs. Al Kuwait is a seaport which has long provided a medium for trade with the interior of the Arabian peninsula. Dates, donkeys, horses, and sheep are the principal interests of the people, who also engage in fishing, pearl diving, and boatbuilding. The country is rich in petroleum deposits. Oil was struck in 1938, and reserves of nine billion barrels of petroleum have been indicated. Production is conducted jointly by the Anglo-Iranian Oil Company and the American-owned Gulf Oil Company. Although the Indian rupee is the legal currency, Maria Theresa dollars are in circulation.

WHEELER B. PRESTON,
Author and Publicist.

ARCHAEOLOGY. The year 1945 saw little concentrated excavation, although considerable study and research took place. This was most evident in the large number of books produced in Europe during the years of the war which in the fall of 1945 were just beginning to reach this country. Ten pages in double column of these new books appeared in the *American Journal of Archaeology*, 1945, and bear witness to the great activity of scholars during this time in France, Germany, Italy, and Russia. Some of these books are already out of print and many may not be available because of bombings.

Mesopotamia.—The most important excavation in Mesopotamia during 1945 was conducted at 'Aqar Quf, 20 miles west of Baghdad. Here was the capital city of the Kassite kings, Dur Kurigalzu. A ziggurat, 69 by 67.60 meters, made largely of well-tempered sun-dried brick with staircases of kiln-baked bricks, was uncovered. The core of the structure, which was oriented to the four points of the compass, rises 57 meters above the plain. After every eight or nine courses of brick was a layer of reed matting of tough texture, bedded in sand and gravel. Plaited ropes of the same material run at intervals through the structure and reinforce it.

In addition to the ziggurat, four temples were partially excavated, the most important of which is known as the House of the Great Lord. The walls are of solid brick; the pavements, of brick, show that they were sometimes coated with bitumen. Fragments of a diorite statue inscribed with the deeds of the king (probably Kurigalzu) were found. Clay tablets give an approximate dating in the 15th century (see Supplement 1944).

Also in northern Iraq, excavations were conducted at Tell Hassuna, south of Nineveh. The earliest human remains yet known in Iraq, dating from Neolithic times, were uncovered in the lowest stratum. The new Hassuna culture dates at the beginning of the 5th millennium. The excavations prove that Samarra ware is earlier than the Tell Halaf period (*Palestine Exploration Quarterly*, 1944).

Greece.—A still unpublished nude male figure, a kouros dating after 510 B.C., was found at Anavysos, in Attica. The statue, after it was discovered, was buried in order to protect it from the Germans, but it is now in the National Museum. The figure is not in a frontal position, the weight having been shifted to one foot. The face is not completely preserved.

The Museum of Fine Arts in Boston, Mass., has acquired a marble sphinx dating c. 540 B.C. The head is missing, the color in a good state of preservation. The sphinx rests on a capital with two volutes and palmettes (*Bulletin, Boston Museum of Fine Arts*, 1945).

A new acquisition by the Metropolitan Museum in New York City was a bronze hydria of the second half of the 4th century. A representation of Eros in relief, looking into a mirror and leaning on an archaistic statue, adorns the vase.

The famous Græco-Iberian statue of the Lady of Elche, long one of the treasures of the Louvre, was exchanged by the Vichy government with Spain and is now in Madrid. It is the subject of an elaborately illustrated book by A. G. y Bellido (*La Dama de Elche y el conjunto de piezas arqueológicas reintegradas en España en 1941*, Instituto Diego Velasquez, Madrid, 1943).

A racial analysis of the Greeks, presented in several studies, shows unusual heterogeneity expressed in six artificial types. The main trend is Alpinoid, and genetic continuity is striking. A study of 40 sub-Mycenaean skulls from Kephallenia (after 1100 B.C.) shows that they are dominated by Basic White (especially "megalthic") and Mediterranean types, with mixed Alpine and Alpine minorities. Where they diverge from Mycenaean Greeks (1600-1100 B.C.) they resemble chalcolithic Sardinians, Sicilians or Minoans, and contrast with Alpinoid Isthmian Greek contemporaries. The problem is raised: What Trojan War activities explain 32 per cent of male head wounds?

Among the most elaborate publications during the war was a new volume on Delphi, containing 248 plates (De la Coste Messelière, *Delphes*, Paris, 1943).

The decipherment of the Cretan script was furthered by a study of the language of Linear Class B on the "chariot" tablets from Knossos, which indicates that it was inflected (*American Journal of Archaeology*, 1945).

Medieval Athens of the 12th century was also studied (*Speculum*, 1944).

Italy.—No new discoveries were reported, but a number of articles on the fate of art treasures and the looting of works of art appeared. The Medici Venus in Florence appears to have been one of the victims. The *London Times* for Oct. 6, 1944, gave a list of the more important works of art sequestered by the Nazis for "safekeeping." These include between 450 and 500 paintings and statues, some of which have been recovered. The famous head of Nefertiti from Berlin was found hidden in a cave in Germany along with hoards of gold.

Enemy bomb attacks revealed new discoveries in regard to Roman London. New views of the

Roman wall resulted from air raids near Cripplegate and belong to the most impressive remains still above ground. One of these views is just north of Tower Hill and is thought to be preserved to its original height. Another section, back of the Crescent, stands 20 feet above the present ground level, but the ancient level was 15 feet deeper. A drawing of a reconstruction of Roman London, showing the line of the wall appeared in *Illustrated London News*, Sept. 16, 1944. (Compare Sept. 9, 1944.)

Bulgaria.—A most significant discovery of a Hellenistic tholos tomb, dating between the 3d and 1st centuries B.C., is reported from Kazanlik. A circular section at the top of the vault contains paintings perfectly preserved, with representations of a funeral banquet with servants and horsemen, and an inner ring with chariot races in honor of the dead (*American Journal of Archaeology*, December 1945).

Spain.—Excavations in Spain at Silos, Catalonia (Catalonia), unearthed in a Benedictine monastery there a strongly fortified town of importance around 100 B.C. It was inhabited for about 1,500 years and contained Bronze Age, Hispano-Roman, and Hispano-Visigothic objects. It is reported that these discoveries "have helped to clear up some points regarding the first Aryan invasion of Spain, and throw light on the Roman and Visigothic periods in Spanish history."

Russia.—The most spectacular discoveries continue to be those in Russian territory, especially in the Black Sea region at Phanagoria, in the Caucasus, and the Saian and Altai expeditions. At Phanagoria, 10 strata dating from the 6th century B.C. to the 13th century A.D. were reported. Greek traces appear first in the Late Archaic period and the beginning of the classical period (10th level). No architectural structures of importance are found before the classical period, but a flourishing building activity is attested for the Hellenistic age. Fragments of wall paintings used as interior decoration were found. The Roman period marks a decline (V. D. Blavatskii, "Otchet o Raskopkakh Fanagorii V," *Trudy*, 16, pp. 5-74).

The Saian Altaian Expedition, under L. A. Fvtiukhova and S. V. Kiselev, reported on burial structures on the Kurai steppe forming a continuous series from the Bronze Age to the 9th century A.D. and on stone statues in the northern Altai.

Publications.—Books covering the significant discoveries in the Caucasus are not yet available in this country. The Smithsonian Institution continues to publish important articles of interest to the general public, one on the "Culture of Indonesia," *Smithsonian Report*, pp. 513-22, 1943); another on "Aboriginal South American Culture," *Ibid.*, pp. 429-61; still a third on "French Indo-China," *Smithsonian Institution War Background Studies*, 19, 1944); the *Geographical Review*, pp. 529-73, 1944, gives a sketch on "Early Man in America." See also PEABODY MUSEUM.

MARY HAMILTON SWINDLER,
Editor in Chief, *American Journal of Archaeology*.

ARCHITECTURE. With the rapid disintegration of the German armies during the first half of 1945, the building industry which had already been poised for postwar activity was given its first go-ahead. On May 29, the War Production Board amended Order L-41 so that some civilian construction might proceed. After that time, and particularly after the defeat of Japan, govern-

mental controls were rapidly relaxed. On October 1, the ban on house construction was lifted to permit the building of 32,000 units for nonveteran, nonwarworking citizens, and on October 15, all restrictions were removed. The Producers' Council estimated that this upturn would result in a four billion dollar total for the industry in 1945. To be sure public construction fell off rapidly but this was offset by a rise of 42 per cent in private construction over 1944 totals.

Under the guise of lend-lease the United States Foreign Economic Administration promised England 30,000 "pre-fab" houses to be used in bombed-out areas. The first units arrived in Britain before May. American designers showed great ingenuity in constructing and packaging these houses within the restrictions imposed by available materials and labor. These homes are 24 by 24 feet with a porch projecting 4 feet on one side. They contain a living room, two bedrooms, kitchen, bath and entry with ample closet space. They set upon a 4-inch concrete slab and, since the heating unit is above ground, no basement is needed.

Meanwhile architects and manufacturers turned their hands toward speeding up housing for the masses. The prefabrication field was entered by many concerns which had built "pre-fab" structures for the nation at war. Some of these concentrated upon panel or sectional construction, others upon the familiar TVA system of delivering the assembled house in sections.

A house of laminated-arch "pre-fab" construction, based upon methods developed in connection with wartime procedures, was designed by architects Kump, Wurster, and Bernardi. A major advantage of this system of construction is the total absence of interior bearing walls and the freedom in planning or replanning room arrangements that results. In such houses the walls and roofs are supported on laminated plywood arches spaced four feet apart and tied together by continuous members at floor, eaves, and roof. Hollow frame wall and roof panels, with any desired surface can be attached to these arches; likewise windows and doors.

Two Texas state colleges collaborated on a small house for Texas habitation. This unit was so planned that each room had maximum cross ventilation. The cost, not including the lot or furniture, was pegged at \$2,000. Architects are more and more recognizing the need for regional differences in houses.

An interesting development was the production upon a "pre-fab" basis of the much-heralded Solar Home designed by Architect George Fred Keck. In this house solar orientation and panel heating are combined in such a way as to insure maximum efficiency of both. A gas-fired furnace is used to produce warm air in a closed system circulated through underfloor, clay tile ducts.

Materials and Construction.—Many materials and processes developed in response to wartime needs were directed toward the building field. This was particularly true of aluminum which is destined for a wide use in the kitchen.

The Heating Research Home at the University of Illinois experimented with a novel method of heating. Here a baseboard made of hollow cast iron is used along the outside walls of rooms. This is supplied with circulating hot water from a standard domestic heating boiler. It provides an easy-to-clean source of heat which results in evenly distributed room temperatures.

A new water- and flame-proof upholstery material (Naugahyde) in a wide range of light,

bright, clear colors and not affected by perspiration, salt water, alcohol, gasoline, oils, greases, most acids, and alkalis, was announced.

Design.—Innovations in design were seen in Frank Lloyd Wright's plans for the Guggenheim Gallery in New York. The architect proposed to display Guggenheim's modern pictures along a continuous ramp ascending by imperceptible degrees for three quarters of a mile. Elaborate designs were worked out for a United Nations Center by architects Wurster, Bernardi, and Burn. Planned to occupy a 1,000-acre bay-side site on Stanford University's vast campus, the design calls for a group of structures including two secretariats, an auditorium, office buildings, a library, a museum, and an archives building, together with the necessary courts, plazas, and landing areas to make this highly modern ensemble a related whole. Another outstanding design was the great research center planned by architects Saarinen and Swanson for the General Motors Corporation. It consists of a group of buildings arranged around a central lake on a 350-acre tract providing flexible space for the corporation's vast program of product development research.

At Rochester, Minn., a thoroughly modern design was adopted for the Kahler General Hospital. Aside from its aesthetic interest, the building will be the first in America to discard riveted-steel construction in favor of an all arc-welded steel frame. The New Tripler Hospital, under construction near Honolulu, in addition to interesting design innovations, presents an earthquake resistant rigid concrete frame with stuccoed concrete-block walls.

Architects.—Postwar planning projects put many architects back to work and many new architectural firms were announced. Several prominent architects died. Among them was J. Andre Fouilhoux of New York, collaborating architect of the Trylon and Perisphere at the New York World's Fair and of the Rockefeller Center. Associated with the late Raymond Hood, Fouilhoux worked on the designs for the Chicago Tribune Tower, and the McGraw-Hill and Daily News buildings in New York. Another loss was John A. Holabird of Holabird and Root, Chicago, whose firm had designed such important buildings as the Palmolive Tower, the Palmer House, the Stevens Hotel, and Northwestern University's Institute of Technology in the Chicago area, and Hotel Statler in Washington. Other losses were N. Max Dunning, architect of Chicago and Washington, and Leon C. Gillette of Walker and Gillette of New York.

The American Institute of Architects elected the following officers: James R. Edmunds, Baltimore, president; Samuel E. Lundeen, Los Angeles, vice president; Alexander C. Robinson, Cleveland, secretary; Charles F. Cellarius, Cincinnati, treasurer.

Foreign Architecture.—French architects, among them the well-known Auguste Perret, Le Corbusier and Andre Croize, were ready with well prepared plans for rebuilding large ruined areas. Perret and Le Corbusier headed reconstruction commissions in Le Havre and La Rochelle respectively. In Athens an underground staff of 250 who, during the war, mapped the destruction in Greece, prepared plans for rebuilding the country. These plans were shown in America by Constantinos Doxiades, director of the Greek Department of Town Planning. The Greek government is taking advantage of great population shifts to put into operation a national master plan. Mexico had a building boom centering in Mexico City. Much

work in an alleged *moderne* style, lavishly employing colored native stone, resulted in rather sad results. Argentina planned to build 20,000 houses a year for the next 20 years. For a population of 14,000,000, this seems an ample program. Brazil continued to build, promoting among others a scheme for a great national stadium with facilities for all the sports popular in the nation. Architect Roland Rohn's new University of Basle, Switzerland, presented a modern, informal functional approach to the housing of a modern teaching institution. At Dornach a new concrete Catholic church by Herman Baur is likewise of thoroughly contemporary design. Baur's school and kindergarten in Basle also presents a functional but definitely human expression for an elementary school. In Sweden the New City Theatre and Concert Hall at Malmö attracted applause from laymen and architects alike. Sweden's beloved Ragnar Östberg, architect of Stockholm's matchless city hall, died on February 5; aged 78. The city hall had received the gold medals of both the Royal Institute of British Architects and the American Institute of Architects. In England the replanning of bombed-out cities was promoted. Manchester exhibited plans for the city and environs. The program calls for breaking the area into districts of 50,000 population each. For these districts complete civic centers, containing public halls, baths, library, health clinics, cinema, church, fire and police stations are planned. The county borough of Middlesbrough held a town-planning show exhibiting one of the finest models of a town so far produced to illustrate modern principles of community development. Sir Giles Gilbert Scott produced designs for the new Coventry Cathedral. Designed to seat 1,000 people, it is definitely modern with echoes of the Gothic.

REXFORD NEWCOMB,
Dean, College of Fine and Applied Arts, University of Illinois.

ARCHIVES, National. See NATIONAL ARCHIVES.

ARGENTINA. A republic of South America extending from Bolivia to Cape Horn a distance of almost 2,300 miles, and having an area of 1,079,965 square miles, or 2,794,024 square kilometers. The areas of subdivisions in square kilometers are: federal district, 196; Isla Martin García, 2; Islas del Sur, 13,133; provinces, 1,584,004; territories, 1,196,689. Bounded on the north by Bolivia, northeast by Paraguay, Brazil and Uruguay, southeast and south by the Atlantic Ocean and Chile, and west by Chile, Argentina consisted of 14 provinces, 10 territories and one federal district until a decree of Sept. 24, 1943 abolished the territory of Los Andes and divided its area among the three neighboring provinces of Jujuy, Salta and Catamarca, thereby diminishing the number of territories to nine.

The population estimate of Dec. 31, 1943, was 13,909,950, including 10,986,636 Argentinos and 2,193,587 foreigners. Chief cities are Buenos Aires, the federal capital, with an estimated population on the same date of 2,457,494 (2,608,333 on April 30, 1945); Rosario, 522,403; Córdoba, 310,070; La Plata, 247,515; Avellaneda, 386,372; Tucumán, 157,926; Bahía Blanca, 115,148; and Santa Fé, 154,173. Since the middle of the 19th century the urban population has steadily increased in relation to the rural. While the census of 1869 indicated 33 per cent urban to 67 per cent rural, an official estimate of 1938 showed the urban percentage increased to 74, compared with a diminished rural percentage of 26. In

1944, for the first time in the country's history, emigration exceeded immigration, 3,713 persons leaving the country to 2,627 arriving.

Religion and Education.—Although the Roman Catholic religion receives state support, there is no state religion. There is complete freedom and tolerance of all creeds. Civil marriage was established in the country in 1888. By decree of Dec. 31, 1943, the teaching of the Catholic religion became a regular part of the curriculum in all primary, post-primary, secondary, and special schools, except when parents object on religious grounds.

In general there is free, secular and compulsory elementary education provided for children, of whom there are about 2,500,000, from 6 to 14 years of age. In 1943 there were 14,565 public primary schools, including 444 for adults. A census taken the same year indicated that of children between the ages of 6 and 13 there were 2,259,642 attending school, while 307,738, or 13.7 per cent of that number, were receiving no education. Minors in the age bracket 14 to 21 numbered 1,874,660, of whom 143,278, or 7.6 per cent, were illiterates. The census was tabulated by provinces and territories, and showed that the federal capital had the lowest illiteracy rate in the two age brackets, amounting to only 1.4 per cent. In 1941 secondary, normal, and special schools under the Ministry of Public Instruction numbered 718, with 135,456 students. Incorporated provincial secondary schools numbered 421, with 42,064 students. Universities are located at Córdoba, Buenos Aires, La Plata, Tucumán; the National University of the Litoral at Santa Fé, with branches in Rosario and Corrientes; and the National University of Cuyo at Mendoza. University students numbered 39,595.

Army and Navy.—Military service is compulsory in Argentina. On May 18, 1944 the government decreed that all high school boys should serve in the army for 12 months instead of 3 months as previously required, and on November 17 it declared citizens between the ages of 12 and 50 subject to military training. Boys and girls below 20 are to be given athletic training. Men between the ages of 20 and 22 are to receive military training, and girls between those ages are to form a "Women's Auxiliary Service." Post-military training is continued for those from 22 to 50 years of age. Married men with one dependent are exempt. All drafted workers are to be re-employed within 30 days after discharge, and half of their service pay comes from employers. Late 1944 figures indicate 2 Argentine armies, each composed of 6 divisions; 3 army air force squadrons, with 4 airbases; and 4 military institutes; a navy composed of 2 battleships, 3 cruisers, 4 coast defense ships, 15 destroyers, 3 submarines, 3 surveying vessels, 2 river monitors, 4 transports, 2 oilers, and 5 tugboats. There are 2 naval bases, 3 naval training schools, and a naval air force of 3 squadrons.

Communications.—There are 26,805 miles of railways of which 8,420 miles are government owned. This is approximately 43 per cent of the railroad mileage of South America. Nearly \$6,000,000 was earmarked (1943) for railway construction in the Province of Mendoza, to connect existing lines with oil wells and coal mines in the region. But railways suffered from wartime restrictions on importation of steel and replacement parts, and from fuel shortage, coal being often replaced by wood, corn, wheat, and oilseed residues. Despite this fact, railroad construction

continued and on March 24, 1944 the Transandine Railroad was opened to traffic.

At the beginning of 1943 there were 32,787 miles of national highways and complementary roads, and 22,686 miles of rural roads. By June 30, 1943, government highways totaled 39,782 miles, and by the beginning of 1944, some 14,000 miles of highway were all-weather roads. During 1943, 2,140 miles of various types of roads were completed. By the end of 1943 nearly 200,000,000 pesos were earmarked for improvement and construction of highways. A highway link with Chile is available through the use of the Transandine Railroad tunnels. The Buenos Aires-Mendoza road, 1,114 kilometers long, is now paved. The four main arteries which represent Argentina's part of the Pan American Highway system are now open to traffic, and the main highway to Bolivia was almost completed at the close of 1943. The link to Paraguay was partly paved, and the artery connecting with Brazil was open to traffic. A road-paving project costing 25 million pesos was carried out in the municipality of Buenos Aires in 1944. Each year October 5 is designated by the government as "Highway Day."

Arrivals of seagoing vessels in Argentine ports during 1944 totaled 1,485 ships of 3,324,407 net register tons, compared with 1,334 vessels of 2,765,393 tonnage in 1943. In 1945, on the third anniversary of the creation of the State Merchant Fleet, it was announced that 27 ships, totaling 134,811 tons, had transported 2,552,446 tons of cargo, and had made 244 outbound and 223 return voyages.

There were in Argentina on May 1, 1945, 11 airports of customs entry, 40 public airdromes, 82 landing strips, 3 hydroplane bases and 11 landing fields. By decree of April 27, 1945 the government provided for preferential ownership and operation of all internal air transport services by the state, or by the state and private Argentine capital. In 1944 the airlines of Argentina (national and international) covered 3,103,027 kilometers in 13,602 flying hours. Passengers carried numbered 78,537; first class mail 106,279 kilograms; parcels 401,002 kgms.; and express 433,384 kgms. A new airport is being built at Buenos Aires for which 20,000,000 pesos was allotted in the 1945 budget.

Agriculture and Industry.—The nation's total area of 279,843,000 hectares (1 hectare = 2.471 acres) is subdivided as follows:

Use	Hectares	Per cent of total
Under cultivation	30,000,000	10.72
Forests	89,683,000	32.72
Lakes, lagoons and wide rivers	3,019,000	1.08
Salt marshes and swamps	2,390,000	.86
Railways	210,288	.07
Cities and towns	500,000	.18
Other unproductive areas, small rivers, canyons, mountains, etc.	38,000,000	13.58
Pasturage, natural and artificial	115,152,628	41.15

Land suitable for the cultivation of cereals amounts to 50,000,000 hectares; of cotton, 4,000,000 hectares; and for cattle and sheep ranges, 88,493,000 hectares.

The Ministry of Agriculture published statistics of the total number of livestock in the country as of June 30, 1945:

Item	Number as of June 30, 1945	Number as of June 30, 1937	Percentage increase over 1937 census
Cattle	34,010,300	33,207,287	2.4
Sheep	56,181,800	43,882,728	28.0
Hogs	8,009,700	3,965,945	102.0

The pampas, withered by one of the worst droughts in recent times and blackened by prairie fires, yielded disappointing crops of wheat, linseed, barley, and rye during the 1944-45 season. The linseed crop amounted to only 767,000 tons, the lowest yield since 1918 and insufficient for domestic requirements, since the oil is now being used as a fuel oil substitute and its export is forbidden. The wheat harvest amounted to only 4,249,300 tons, less by 2,550,000 than was previously estimated. Barley production dropped to 574,300 tons, less by 144,300 than estimated. More than half the rye crop was destroyed, leaving a yield of only 259,400 tons. However, during the August sowing season, weather conditions improved, although scant rainfall augured a small flaxseed crop and the government, to stimulate larger plantings, guaranteed a minimum price to farmers for the 1945-46 crop. In midsummer the Ministry of Agriculture made the following estimates in metric tons of crop productions for the 1944-45 season: corn 3,069,700; rice 141,150; sunflower seed 1,028,600; peanuts 158,400. In August the ministry published its first estimate of the 1944-45 cotton crop as 72,300 metric tons, also an estimate of the sugar crop as 5,772,720 metric tons, an increase of 4.7 per cent over the previous year.

A recent industrial development is the establishment of 20 factories in the Mar del Plata and Necochea areas beginning early in 1943 for the extraction of vitamin A from shark livers. A production of about 20 trillion units in 1944 placed Argentina second only to the United States in world production. Various by-products of shark-liver oil promise the development of new industries, and shark meat has found a local market.

Plans have been made for the erection of two factories as well as for expansion of the existing rayon plants at Berazatagui. One of the factories will manufacture nylon while the other will make cellophanes.

Mining.—Argentina's mining industries are small and account for only a small fraction of the country's total industrial output. According to a 1941 survey of the Argentine General Office of Statistics, 374 of a total of 57,978 industrial establishments were engaged in mining, quarrying and oil-drilling; and these 374 establishments employed only 23,847 workers.

A very small part of the total mineral output is shipped abroad. In 1942 total mineral production amounted to about 9,000,000 metric tons valued at 79,000,000 pesos (\$24,000,000), of which the exports were about 133,000 tons valued at 20,000,000 pesos (\$5,600,000). During the war the government controlled all mineral exports.

Petroleum.—During the first six months of 1945 petroleum production reached 1,839,401 cubic meters, a decrease of 5.6 per cent compared with the corresponding period of 1944. Of this production, 1,238,840 cubic meters was from the state oilfields and 600,561 was from privately owned fields. It is estimated that the country contains a net oil reserve of 262,000,000 barrels of which 100,000,000 barrels will remain by 1950. A fuel shortage in 1944, continuing into 1945, was caused by lack of oil drilling equipment. Approximately 1,000,000 tons of linseed oil were used for fuel oil in 1944, and the necessity of employing this substitute caused the government early in 1945 to ban the export of linseed oil.

Finances.—The Farrell-Perón government's budget for 1945 amounted to 2,339,000,000 pesos, or 60 per cent more than was spent in

1942, the last complete year before the army revolution which placed it in power. Revenue for the year as forecast in mid-September was not expected to amount to much more than half this amount. Military expenses soared both actually and relatively, though Argentina took no active part in the war. In 1942 they amounted to 274,000,000 pesos, or 18 per cent of total expenditures; in 1945 they climbed to 947,000,000 pesos, or 39 per cent of the budget. Expenditures for public works in 1945 were set at a maximum of 343,326,000 pesos (approximately \$100,000,000), about 7 per cent more than in 1944; but it will be noted that this figure is little more than a third of the sum devoted to military expenses. The Ministry of Education received a meager increase of 7,000,000 pesos; that of Justice and Public Instruction obtained an additional 18,000,000; that of Agriculture less than 2,000,000 more than in 1944.

The internal debt has progressively increased from 3,845,000,000 pesos in 1941 to 8,941,000,000 in 1945, occasioning severe criticism of the government's financial policy by the Bondholders' Corporation in its report for the biennial period ended June 30, 1945. The external debt (sterling, dollar and Swiss franc), however, showed a substantial decline in the period from June 30, 1944 to June 30, 1945.

Foreign Trade.—During the first half of 1945, Argentine foreign trade, exclusive of gold, dropped more than \$54,000,000. It fell from 1,672,555,000 pesos in the first half of 1944 to 1,455,339,000 pesos in the first half of 1945, a decline of 217,216,000 pesos (1 peso = approximately 25 cents, United States currency). Exports dropped from 1,186,091,000 pesos to 988,354,000, a decline of 16.7 per cent. Imports dropped from 486,464,000 pesos to 466,985,000, a decline of more than 4 per cent.

Exports of linseed oil to the United States in 1944 amounted to 22,771,397 kilograms, compared with 29,771,425 kgms. the preceding year. The government embargo on export of linseed oil early in 1945 will be reflected in a still more drastic reduction in the total 1945 figure. Exports of casein increased from 15,022,000 kgms. in 1943 to 23,282,893 in 1944.

For the first five months of 1945, exports of cotton totaled 2,508 metric tons, compared with 3,227 in the corresponding period of 1944. More than 50 per cent of this export was absorbed by Chile, and most of the remainder by Uruguay, Bolivia and Cuba. During the period October 1944 to May 1945 wool exports totaled 95,533 bales, compared with 158,126 bales in the corresponding period of 1943-44.

Traditionally Britain has been Argentina's best customer, and consequently Britain has taken the lion's share of the export trade to that country. A 3-year trade agreement signed in 1936 was extended for the period of the war. By announcement of the United Kingdom's Board of Trade on Sept. 28, 1945, this pact was terminated as of Feb. 21, 1946; but continued meat shipments were provided for in a separate contract agreed on in principle. Britain's mounting unfavorable balance of trade appears in the following statistics. Britain's exports to Argentina in the first half of 1938 amounted to £9,669,000 and her imports from Argentina to £19,000,000. For the corresponding period of 1945 the British export figure dropped to £2,130,000, while imports increased to £20,502,000. As a consequence of the conclusion of the meat agreement it is expected that the amount of British

imports will again rise sharply, perhaps to the neighborhood of the £41,000,000 which represented Argentina's sales to Britain for the first half of 1944.

GOVERNMENT AND PRINCIPAL EVENTS

Briefly noted, the main features of Argentina's governmental organization and structure established by the Constitution of 1853 are as follows: The president, who by the constitution must be a Roman Catholic, is indirectly elected for a six-year term by a college of electors. He may not be re-elected without an intervening six-year period. The executive, administrative and legislative powers of the Argentine president are more numerous and much more comprehensive than are those of the president of the United States. This is partly due to constitutional grants of power and is partly based on constitutional development. The executive power is shared with a Cabinet of eight ministers and two heads of secretariats, who are appointed by the president. Senate confirmation of these and other important executive appointments is not required. The ministers are responsible to the president and not to the Congress even though in past years they have appeared before the Congress for interrogation.

Legislative power is lodged in a Congress of two houses. The Senate of 30 members (2 from each of the 14 provinces and two from the federal capital), is elected by the provincial legislatures, also a copy of the original American practice. Their term is six years, and one third of the membership retires each two years. The Chamber of Deputies has 158 members, chosen by direct popular election (manhood suffrage only), for a four-year term, one half retiring each two years. The constitution provides for annual sessions running from May 1 to September 30, but it has been the practice of the Congress not to begin its legislative work until the president was ready to present the annual message. This has often delayed the opening of congressional sessions as much as three or four weeks. Of the 158 deputies 32 are elected from the city of Buenos Aires and 42 by the Province of Buenos Aires. This indicates in some degree the extent of control which Buenos Aires city and province exercise over the political affairs of the entire Argentine nation.

The judicial branch of the government is composed of a Supreme Court, which resembles that of the United States in both powers and organization, and inferior federal courts.

In normal times the provinces have a governmental organization, including executive, legislative, and judicial departments, closely resembling the government of an American state.

As a result of the military coup d'état of June 4, 1943, the regular constitutional guarantees and the governmental organization described above were summarily suspended. The Congress was dissolved, all provincial and municipal governments intervened, and the totality of political power and authority was lodged in the military group which planned and carried through the revolution.

The actions and maneuvers, international and domestic, of the Argentine government during 1945 kept that country on the front page of the world press much of the time. The year began with attention on the international position of Argentina and closed with questions of domestic concern holding the center of the stage. During October 1945 Argentina experienced both a revolution and a counterrevolution, violent and to

some extent bloody, and at the time of writing (October 1945), there are many indications that significant and perhaps violent changes may yet occur.

As noted in the 1945 *AMERICANA ANNUAL*, the Argentine government, late in 1944, requested that the Pan American Union examine the Argentine "situation" in an attempt to ascertain whether or not that country was living up to its inter-American obligations and commitments. This examination precluded, however, any discussion of domestic policy or action, so often the cause of the failure of that government to comply with what was believed by many American nations to be its inter-American responsibilities. Certain events of December 1944, occurring too late to be included in last year's summary, need noting to provide background for later developments. On Dec. 16, 1944 the government by decree adopted a new military conscription program that applied to all males between the ages of 12 and 50. This naturally caused apprehension among many of Argentina's neighbors; Colonel Perón later explained that boys of 12 to 18 would get only physical training in the schools, but under army direction. In the same month a strike occurred among workers of the government oil plant at La Plata. It was called as a protest against the jailing of labor leaders and the secretary of labor, (Perón) had to threaten use of naval personnel in order to break this stoppage. Late in December the three commissioners to draft the "statute of political parties" were named, all judges of moderate and supposedly democratic views. Finally, at the end of 1944 there was formed at Montevideo the so-called *Patria Libre* (Free Fatherland) Committee of 4 members, one representative from each of the four political parties, Conservative, Radical, Socialist, and Communist.

On Jan. 8, 1945, the Pan American Union voted to reject the Argentine request for a consideration of her case, only the Argentine delegate voting in the affirmative. On the same date it was announced that there would be a meeting of the foreign ministers of the American republics at Mexico City on Feb. 15, 1945 (later postponed to February 21) to discuss war and post-war problems. Argentina was not to receive an invitation to attend. One week later General Peluffo, the foreign minister and the last of Perón's opponents in the Cabinet, resigned over "differences on policy." It was known that he opposed Perón's saber-rattling tactics. On January 29 the government promulgated the Security of the State Decree, banning strikes and other acts against the authority of the state, regulated public meetings to the point of prohibiting them except under unusual circumstances, and subjecting the press to further controls.

The Conference of the American Republics on Problems of War and Peace opened at Mexico City February 21, with neither Argentina nor El Salvador invited to attend. It was obvious that despite its absence Argentina would play an important role. On February 9, perhaps with the conference in mind, the government announced that the "phase of pre-electoral organization" had been entered and 70 school teachers dismissed at earlier dates were reinstated. Late that month many of the professors dismissed for pro-democratic views or writings were reinstated, and two of the ultra-nationalistic dailies of Buenos Aires were closed. On February 26, Colonel Perón made the enigmatic statement to the press that he had long favored friendly relations with Rus-

sia, just three months after his incendiary anti-communistic speech before the Chamber of Commerce of Buenos Aires.

The conference at Mexico City took two important steps with reference to Argentina. One was the so-called Act of Chapultepec, by which the American republics agreed to aid each other against aggressive acts even though made by an American state. This proposal, obviously aimed at Argentina, was introduced by Brazil, Colombia, and Uruguay. The second step, March 19, was the declaration intimating that Argentina could re-enter into the good graces of the American states if it would "co-operate with the other American nations by identifying itself with the common policy." Exactly one week later Perón secured the declaration of war against Germany (in February of 1945 he stated in a press interview that Argentina would not take this step inasmuch as it would make her the laughing stock of the world), and the government instituted a few measures to implement this declaration. The Nationalist Alliance was closed, the crew of the *Graf Spee* was really interned, German language papers were closed—including at least one that had been consistently anti-Nazi, Fritz Mandl was arrested (to be released shortly), and the munitions firm in which he was interested was intervened. On March 31 the Pan American Union resolved that Argentina could sign the Declaration of Chapultepec, which she did on April 4. Venezuela recognized the Farrell government on April 8, and on the following day it was recognized by the United States and the other American republics. The Argentine government, however, continued to have internal difficulties. While the declaration of war was approved of by perhaps a majority of the Argentine people, the most of these felt that a government that had shown itself to be so reluctant to aid in the cause of the United Nations could not take such a step with either grace or honor. Another strike occurred, this time involving 20,000 packing plant workers and a number of dock workers. It was in protest against the failure to live up to an oft repeated promise to release political prisoners.

Mr. Spruille Braden was appointed as United States Ambassador to Argentina on April 19. Despite the fact that Argentina was at war with Germany, a police edict forbade any celebration of the fall of Berlin, and forbade the newspapers to use their sirens or eight column heads to announce the event. Late in April, claiming a wide-spread plot against the government led by General Espindola, a new wave of arrests took place. Over 400 persons were rounded up and jailed, among them many representative leaders of Argentine intellectual and social life.

Early in May, Argentina once again made international news over the question of her admission to the United Nations Conference at San Francisco. On May 7, Russia's Foreign Minister Molotov made his speech against this proposed action, asked for a delay, and to support his stand cited remarks of the late President Roosevelt and former Secretary of State Hull on the Fascist nature of the Argentine government. Only three states supported the Russian position and Argentina was admitted, a step that clearly strengthened the government internally and weakened and demoralized any opposition. Apparently heartened by this very favorable action, the government, late in May, increased the tempo and vigor of its campaign against all opponents within the country. A new wave of arrests took

place, the press was threatened and even more closely regulated, both of which measures were in violation of at least the spirit of the Act of Chapultepec. Arnaldo Cortesi of the New York *Times* reported to his paper on May 30 that the actions of the Argentine government exceeded anything he had seen during his 17 years' stay in Fascist Italy. This time the opposition, which had supporters among almost all economic groups within the nation, fought back. On June 16 there was published as a full-page advertisement in most Argentine dailies a declaration originally signed by 319 representatives of Argentine business, industry, farm groups, and labor. Many other groups adhered to this declaration in the succeeding days. It accused Perón of fomenting class hatred and of embarking upon unwise and dangerous economic policies. Incidentally, at about this same time the Treasury announced that the deficit for 1944 was 1,006,600,000 pesos, the largest in Argentine history. This gave credence to the claims made by José Aguirre Camara, in his widely circulated underground pamphlet, *Demagogues, Inflation, and Armaments* (published December 1944), that the military plans and expenditures of the government would bankrupt the nation.

These moves of the opposition did have some effect. Late in June it was announced that political prisoners would be freed, and many were. Many of the Montevideo emigrés were allowed to return to Argentina; they were given noisy and enthusiastic welcomes upon their arrival at the Buenos Aires port. It was again announced that press controls would be lifted. It also became more evident at this time that a significant number of army officers were opposed to Colonel Perón's plan of using the army as a stepping stone into the presidency. Perón's statement to the press of July 3 perhaps referred to this when he said, "I have enough forces in the army and in the army of labor to put down any insurrection."

The failure of Argentina really to implement her declaration of war against Germany was referred to late in June by Assistant Secretary of State William Clayton. Testifying before a Senate military affairs subcommittee he reported that little had been done to control about 104 Axis firms in Argentina, except to note that "four were in process of elimination."

On June 18 the students of the National University at Santa Fé (who in July and August of 1943 were among the most consistent and vigorous opponents of the then newly emerging dictatorship) organized a demonstration supporting the restoration of constitutional government and individual liberty. Nearly 500 were jailed and this touched off student demonstrations in all Argentine universities. A 24-hour strike was called for and held on June 28, in which many high schools joined. Many of the professors openly expressed their sympathy with the aims of the students. On July 6, the students of the University of Buenos Aires adopted a resolution asking the dismissal of all professors known to have anti-democratic views.

In the face of this mounting opposition and pressure the government again acted. On July 16 President Farrell announced that free elections would be held "before the end of the year." Almost coincident with this announcement there was held a meeting of the Radical Party at the town of Nueve de Julio, located about 200 miles from Buenos Aires. Although political party meetings had been banned since December 1943

under the decree abolishing all parties, it was reported that this meeting was allowed on the suggestion of Admiral Teisaire, acting minister of interior, who believed that the party would not oppose the government and might even vote its support. Such an appeal undoubtedly would have influenced Colonel Perón who was seeking the backing of a legitimate party in his campaign for the presidency. The meeting turned out to be one in which the government was bitterly denounced. Eduardo Teisaire, a Radical Party leader and brother of the admiral, was quoted as saying, "There are no Argentines in government house." An ironic note was added to this disturbed internal and international situation late in July when a German submarine surfaced in Argentine waters to surrender to Argentine authorities. Some in Brazil believed it to be the submarine that sank a Brazilian naval vessel in the last days of the European war.

Ambassador Braden, who by his public speeches had gained an enormous popularity among Argentine democratic forces, was made the object of a bitter smear campaign in late July and early August by Argentine Nationalists. He was accused of being an advance agent of intervention, and was falsely linked to the Braden Copper Company of Chile, which had recently experienced a mine disaster in which several hundred lives were lost. Almost 400 Argentines published a manifesto branding this campaign as an attempt to sow discord, mistrust, and hate.

Colonel Perón continued with his plans to obtain the backing of a political party for his presidential ambitions, and made some overtures to the Radicals. This caused the party to adopt a resolution which provided for automatic expulsion of any member that collaborated with the government in any way. A group of army and navy officers visited with General Farrell and expressed their approval of the plan to call elections and their strong disapproval of Perón's candidacy. On August 1 a declaration signed by the rectors of the six national universities denounced this candidacy. The lifting of the "state of siege," in effect since December of 1941, was announced by the acting minister of interior, Hortensio J. Quijano, (an expelled Radical) in late July. The Statute for the Security of the State, which gave the government almost the same controls, was still in force however.

The surrender of Japan was a signal for demonstrations and counterdemonstrations in August. The Nationalists rioted in front of the paper *Critica*, and although property was damaged and destroyed, the police made no real effort to restrain the group. On August 25, Nelson Rockefeller resigned as assistant secretary of state and the same day Ambassador Braden was nominated for the post. He was reported as saying that "my policy respecting Argentina and the United States will not alter in the slightest." This shift in our State Department without any doubt deeply affected the trend of events in Argentina. Mr. Braden's views were widely known in Argentina, and many Argentines associated Mr. Rockefeller, rightly or wrongly, with the move to admit Argentina to the San Francisco Conference.

Another strike of university students occurred on August 20, a protest against the continued wave of arrests and invasions of personal liberty. The government countered by dismissing 24 professors. On August 24, the foreign minister and the minister of finance resigned, and two expelled members of the Radical Party were named

to their posts. The Supreme Court made another assertion of its independence in its opposition to the government on August 31. It annulled the sentences against General Espindola and 11 others that were imposed by the War Council for complicity in the alleged plot of April 1945.

On September 5, the correspondent of the New York *Herald Tribune* reported that Colonel Perón was holding conferences with Radical Party leaders in the province of Córdoba. He also stated that Perón would resign his posts as minister of war and secretary of labor, to be replaced by Gen. Eduardo Avalos and Col. Domingo Mercanté. Perón did announce his formal candidacy for the presidency to an army officer reunion in early September. In mid-September the new foreign minister stated that Argentina would proceed against German firms in Argentina, and that it would lift press restrictions.

The March for the Constitution and For Freedom was staged in Buenos Aires on September 19, and an estimated crowd of 400,000 took part despite the efforts of the government to prevent the gathering. On September 24, there was published an open letter signed by 42 navy admirals and captains demanding immediate return to constitutional government. The next day the government announced the discovery of another plot against the regime in the province of Córdoba, headed by General Rawson and Luciano Molinas, ex-governor of Santa Fé province. This was the excuse given for the reinstitution of the "state of siege" the next day. A large number were arrested, including two former foreign ministers, and members of the directing staffs of both *La Nación* and *La Prensa*. These acts, in turn, led to further student protests and demonstrations; it was at this time that the students of the University of Buenos Aires staged their widely publicized sit-down strike in the university buildings. On October 5, affected perhaps by the disturbed situation in Argentina, it was announced that the meeting of the foreign ministers of the American republics, scheduled at Rio for October 21, had been postponed.

Army officers, mainly younger officers with the rank of major or below, began to arrive in Buenos Aires by plane from all parts of the country on October 8. The next day General Avalos, commander of the garrison at Campo Mayo, just outside of Buenos Aires, moved troops on the city. No resistance was encountered and that afternoon it was announced that Perón was deposed, and that a new government would be formed at once. Despite his ouster Perón addressed a large labor gathering outside of the offices of the Secretariat of Labor the following day. That evening he was placed under arrest, although his detention proved to be a short one.

The new military group headed by General Avalos differed over one fundamental policy, a difference that gave Perón the opportunity to stage his comeback. Part of the group, General Avalos among them, wished General Farrell to continue as president until the elections could be held. Others favored turning the government over to the Supreme Court, which could act as an interregnum governing agency. The view of General Avalos prevailed but, given the attitude of the political parties and most of the opponents of the military regime, it meant that the government could not count on their collaboration nor their co-operation. These groups had stated more than once that they would accept posts only in a democratically chosen govern-

ment. On October 12, it was announced that elections would be held on April 7, 1946, and on the following day Generals Farrell and Avalos, with Admiral Lima, constituted themselves as a sort of governing triumvirate. This alienated all who wished to see a democratic government at once, and paved the way for the return of Colonel Perón. He was back in control on October 17.

A demonstration of workers was held in the Plaza de Mayo on the afternoon of the 17th, at which there was an attendance of perhaps 50,000. It should be recalled that as Secretary of Labor, Perón followed a policy of organizing unions personally, and restricting unions that reflected the real will of the members. This, of course, gave him a labor following. It must also be stated that regardless of the reasons behind his actions he had secured the adoption of measures that attempted to better the economic position of labor in Argentina, both urban and farm workers. The demonstration at the Plaza closed with General Farrell and Colonel Perón embracing each other; there followed shortly thereafter the resignation of the Avalos government. On the next day Colonel Perón resigned from all of his governmental posts, and since then he has directed all of his attention to his campaign for the presidency. Although out of the government officially he, of course, controls it.

On October 23 he appeared at the ceremony of the new government's inauguration at which his close personal and ideological friend, Gen. Juan Pistarini was sworn in as vice president, Perón's old post. At the ceremony the new minister of interior stated that the elections would be held as earlier announced, that they would be free, and that they would be administered by the army, the navy and the air force.

The political views of the new government are in part indicated by others who attended the ceremony. Among them were Enrique Osés, formerly editor of the ultra-nationalistic and openly pro-Axis paper *El Pampero* (later *El Federal*); Manuel Fresco, former governor of Buenos Aires province and a widely known nationalistic leader; and Carlos Ibarguren, author and biographer of the 19th century dictator Rosas.

As noted earlier, the situation on November 1 was far from resolved. It seemed unlikely that the democratic forces which took part in so many of the movements noted here would remain politically quiescent for long. Repercussions were expected to take place in Argentina as the result of the ousting of Vargas in Brazil at the end of October, as well as of the recent confirmation of Mr. Braden as assistant secretary of state by the United States Senate. As is known, Mr. Braden's views and position were given an airing in the Senate hearings.

Other international events and international organizations will also play a significant role. As this article went to press the news arrived that on Oct. 31, 1945 the delegates representing Argentine labor to the Paris meeting of the International Labor Organization (not the government nor the employer representatives) were barred from the meetings by unanimous action of the delegates on the ground that they did not represent Argentine labor but were hand picked by the Secretariat of Labor. Argentina's domestic problems continue to make her front page news in the international scene.

A. N. CHRISTENSEN,
Associate Professor of Political Science, University
of Minnesota.

ARIZONA. Mountain state, United States; admitted to Union Feb. 14, 1912. Population (1940): rural 325,280; urban 173,981; total 499,261. Land area, 113,580 square miles, divided into 14 counties. Chief cities, with 1940 populations: Phoenix, the capital, 65,414; Tucson, 36,818.

Chief State Officers, 1945.—Governor, Sidney P. Osborn; secretary of state, Dan E. Garvey; treasurer, William T. Brooks; auditor, Ana Frohmiller; attorney general, John A. Sullivan.

Judiciary.—Chief justice, Arizona Supreme Court, Rawleigh C. Stanford; associate justices, Arthur T. LaPrade and Joseph H. Morgan.

Legislature.—The state legislature (Senate, 19 members; House of Representatives, 58) convenes biennially in odd years on the second Monday in January.

Education.—Public elementary schools (as of May 28, 1945), 466; teachers, 2,694; pupils, 91,893; average yearly salary of elementary school teachers, \$1,705. Public senior high schools (as of May 28, 1945), 81; teachers, 942; students, 20,435; average yearly salary of senior high school teachers, \$2,160. All public schools in Arizona are open to pupils between the ages of 6 and 21 years, inclusive; education is compulsory for those between the ages of 8 and 16, inclusive. There are 5 teacher training schools in the state. State per capita aid apportioned to counties for direct use (1943-44), \$6,217,553; state moneys paid direct to school districts for vocational education programs, teachers salaries, current expenses (1943-44), \$16,426. Superintendent of public instruction, E. D. Ring.

Finances.—The following figures were furnished by William T. Brooks, Arizona's state treasurer:

Balance (general fund), July 1, 1944....	\$ 6,002,587.57
Receipts, 1944-45	8,858,331.42
Transfers to general fund, 1944-45	4,851,336.46
Expenditures, 1944-45	12,310,162.67
Returned checks	13,636.17
Transfers from general fund, 1944-45	3,351,625.53
Balance (general fund), June 30, 1945..	4,036,831.08

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1, estimates of the 1945 crops, are shown in the following table:

Crop (and unit of production)	Production		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bus.).....	411	361	437
Oats (1,000 bus.).....	219	319	416
Wheat (1,000 bus.)....	844	528	550
Barley (1,000 bus.)....	1,159	2,812	2,508
Sorghums for grain (1,000 bus.)	856	2,176	1,802
Flaxseed (1,000 bus.)..	315	456	304
Cotton (1,000 bales)...	185	136	135
Hay:			
Alfalfa (1,000 tons)...	448	628	585
Tame (1,000 tons)....	539	783	729
Beans, dry edible (1,000 bags)	56	64	66
Potatoes (1,000 bus.)...	327	1,342	1,365
Grapefruit (1,000 boxes)	2,530	3,750	4,400
Oranges (1,000 boxes)...	502	1,150	1,240
Grapes (tons)	920	1,500	1,000

ARKANSAS. West South Central state, United States; admitted to the Union June 15, 1836. Population (1940): rural, 1,517,477; urban, 431,910; total, 1,949,387. Land area, 52,726 square miles, divided into 75 counties. Principal cities, with 1940 populations: Little Rock, the capital, 88,039; Fort Smith, 36,584; Hot Springs, 21,370.

Chief State Officers, 1945.—Governor, Ben L. Laney; lieutenant governor, J. L. Shaver; secre-

tary of state, C. G. Hall; treasurer, J. Vance Clayton; attorney general, Guy E. Williams.

Judiciary.—Chief justice, Arkansas Supreme Court, Griffin Smith; associate justices, Frank G. Smith, E. L. McHaney, J. S. Holt, R. W. Robins, Ed F. McFaddin, Minor Millwee.

Legislature.—The state's General Assembly (Senate, 75 members; House of Representatives, 100) meets biennially in odd years.

Education.—Public elementary schools (1944), 3,894; teachers, 8,644; pupils, 311,255; average yearly salary of elementary school teachers, \$721. Public high schools (1944), 719; teachers, 3,657; students, 100,066; average yearly salary of high school teachers, \$1,060. Education in Arkansas is compulsory for all children between the ages of 7 and 15, inclusive. There are two teacher training schools in the state, and one college for Negroes. Total state appropriation for education (1944), \$13,391,997; appropriation by cities and counties (1944), \$8,695,146. Commissioner of education, Ralph B. Jones.

Finances.—The following statement of finances for the fiscal year 1944-45, was supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 32,492,619.99
Receipts, 1944-45	63,878,968.68
Total	\$ 96,371,588.67
Transfers to all funds	45,133,628.26
Total	\$141,505,216.93
Transfers from all funds	45,162,885.24
Total	\$ 96,342,331.69
Disbursements, 1944-45	61,326,058.24
Balance, beginning of fiscal year 1945-46	\$ 35,016,273.45

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1, estimates of the 1945 crops, are shown in the following table:

Crop (and unit of production)	Production		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bus.).....	33,844	32,300	34,722
Oats (1,000 bus.).....	5,464	9,405	8,559
Wheat (1,000 bus.)....	516	588	483
Barley (1,000 bus.)....	126	170	162
Sorghums for grain (1,000 bus.)	150	144	119
Rice (1,000 bus.).....	9,537	14,469	14,352
Cotton (1,000 bales)...	1,322	1,394	1,300
Hay:			
Alfalfa (1,000 tons)...	163	191	187
Tame (1,000 tons)....	1,075	1,266	1,399
Wild (1,000 tons)....	163	171	186
Soybeans for beans (1,000 bus.)	1,139	3,612	3,875
Peanuts (1,000 lbs.)....	9,050	6,000	4,800
Pecans (1,000 lbs.)....	3,585	4,200	5,040
Sweet potatoes (1,000 bus.)	2,122	1,955	1,805
Potatoes (1,000 bus.)...	3,278	3,196	2,394
Apples (1,000 bus.)....	753	568	312
Peaches (1,000 bus.)...	2,061	2,646	2,967
Pears (1,000 bus.).....	172	228	231
Grapes (tons)	8,430	10,600	4,700

ARMY AND NAVY POSTWAR EDUCATIONAL PROGRAMS. See EDUCATION, REVIEW OF.

ARMY EMERGENCY RELIEF. Organized and incorporated under the laws of the District of Columbia, Feb. 5, 1942, to render emergency financial assistance to army personnel, regardless of rank, who are on extended active duty, and their dependents, regardless of relationship. This organization is officially connected with the War Department. Army personnel located at posts, camps, and stations may apply to the local AER officers or the Red Cross field directors, while their dependents located in communities may ap-

ply to the nearest Red Cross chapters for such assistance.

HENRY H. DUVAL,
Colonel, United States Army.

ARMY OF THE UNITED STATES. Just before Germany's surrender the War Department announced that the army had reached a strength of 8,300,000. Since this total included the sick and wounded in army hospitals and men in process of rotation from combat theaters, the strength of the army in terms of military effectiveness was actually less than the previously planned maximum of 7,700,000. At the peak of deployment against Germany and Japan in 1945, approximately 66 per cent of the army was overseas. Of the overseas forces, about 3,500,000 men were in Europe on V-E Day. The others were deployed on all of the other continents and on island outposts from the tropics to the Arctic.

In the early stages of the war, the allied strategy had been to deploy to the Pacific forces sufficient to contain the Japanese advance and prevent a threatened junction of the Axis powers. It was considered essential to destroy German military power before turning the combined might of the Allies to the crushing of Japan. Hence the bulk of the army's combat forces had been sent across the Atlantic. With our Allies, they had by the fall of 1944 knocked Italy out of the war and driven the Germans out of Africa, Sicily, most of Italy, all of France, Belgium and Luxembourg and southern Holland.

Following the failure of a strong German counterattack in the Ardennes in December 1944 (See *WORLD WAR, SECOND*), the heavy assaults of the Western Allies and the massive attacks of the Red Army against the German front in the east made it abundantly clear that the end of Germany's military domination of Europe could not be long delayed.

Meanwhile, the limited American forces in the Pacific, with their British and Chinese Allies on the Asiatic mainland, had more than performed their mission of stopping the Japanese advance. Starting with Guadalcanal in the Solomons and the arduous New Guinea campaign, Americans, Australians, and later Dutch forces had destroyed or neutralized the Japanese garrisons in the Aleutians, the Marianas, the Carolines, and parts of the Dutch and British East Indies. The taking of Guam and Saipan in the summer and fall of 1944 had opened the road to the Philippines and supplied air bases for the B-29 bombers which were laying Japanese war industry in ashes. With the liberation of the Philippines under way, the assault moved into Japan's inner defenses. Iwo Jima fell to the United States Marines in March 1945, and Okinawa was taken by a combined Army-Marine Corps task force in June.

Anticipating long and determined resistance by undefeated Japanese armies numbering several millions, the army in May 1945 bent all its energies to redeployment from Europe to the Pacific. At the same time demobilization was begun, with the announced objective of discharging 1,300,000 enlisted and commissioned personnel within twelve months. Preference in discharge was given to men with the highest point scores in an army-wide rating based upon length of service, overseas service, combat credit including decorations, and number of children (up to three) under eighteen years of age.

While redeployment was in full swing, a series of momentous events resulted in the surren-

der of Japan. The growing destruction of Japanese war industry by bombing, the preparation of a mighty invasion force, and a shortage of food and raw materials due to naval and air blockade had prepared the Japanese High Command for desperate measures. The dropping of two atomic bombs by Army Air Forces planes on Hiroshima and Nagasaki together with the Soviet declaration of war on Japan, supplied the final push which resulted in the signing of the Japanese surrender instrument in Tokyo Bay on Sept. 2, 1945. With the ending of hostilities, occupation of Germany and Japan and demobilization of surplus personnel, became the principal missions of the army.

Organization and Administration.—The War Department was guided through the war by Henry L. Stimson, Secretary of War, assisted by Robert P. Patterson, Under Secretary (now Secretary) of War; John J. McCloy, Assistant Secretary of War; Robert A. Lovett, Assistant Secretary of War (Air); and by numerous military and civilian officials who complete the personnel of these and other secretarial offices. Under the Secretary of War was the Chief of Staff, General of the Army George C. Marshall. He was assisted by the Deputy Chief of Staff, Gen. Thomas T. Handy, and by the War Department general and special staffs. The five assistant chiefs of staff on the General Staff are: Maj. Gen. Stephen C. Henry, G-1; Maj. Gen. Clayton Bissell, G-2; Maj. Gen. Idwal H. Edwards, G-3; Maj. Gen. Russell L. Maxwell, G-4; and Lieut. Gen. John E. Hull, Assistant Chief of Staff in charge of Operations.^o Besides other divisions, the Special Staff includes the offices of the Legislative and Liaison Division headed by Maj. Gen. W. B. Persons; the Civil Affairs Division headed by Maj. Gen. J. H. Hildring; the War Department Manpower Board headed by Maj. Gen. C. H. Bonesteel; and the office of the Inspector General headed by Lieut. Gen. Daniel I. Sultan. Additions to the Special Staff are the Special Planning Division and the New Developments Division. The former is concerned with duties and functions which relate to planning for postwar military and related industrial demobilization. The latter is concerned with the innovation, development, and application of new weapons, devices, and techniques of military value. Since the establishment of the Civil Affairs Division in the Office of the Chief of Staff on April 7, 1943, close co-operation has been maintained between it and the Operations Division of the War Department General Staff, the commanding generals of theaters of operations, and the Army Service Forces. In addition to the School of Military Government at Charlottesville, Va., since 1943 courses in military government have been carried on for military personnel at Yale, Harvard, Northwestern, and Leland Stanford universities, and at the universities of Michigan and Chicago. The War Department Manpower Board, established in January 1943, scrutinized the nation's employment of manpower and made recommendation for the correction of misuses of manpower and the elimination of unnecessary jobs. The Budget Division, which supervises all War Department and army budgetary matters; the National Guard Bureau, which is the War Department administrative agency for the National Guard and the State Guards;

^o On each general staff there are four "G's," officers who are directly in charge: of personnel (G-1), of intelligence (G-2), of plans and training (G-3), and of supply (G-4).

and the Office of the Executive for Reserve and ROTC Affairs, also belong to the Special Staff.

Since the reorganization of the War Department and the army in 1942, the army's air, ground, and supply divisions have been progressively welded into the most effective and best equipped military force in the country's history. Under the direction of the Joint Chiefs of Staff, headed by Fleet Admiral William D. Leahy as chief of staff to the commander in chief, operations of the army and navy have been more closely co-ordinated than at any time in our history. The Joint Chiefs of Staff have represented the United States in the co-ordination of American striking power with that of fighting elements of the other United Nations under presidential directives. The services have been represented on the Joint Chiefs of Staff by Generals of the Army G. C. Marshall and H. H. Arnold and Fleet Admiral E. J. King.

Under General Marshall's direction, domestic operations of the army have been conducted under Army Air Forces, Army Ground Forces, and Army Service Forces, which were commanded at the close of hostilities by General of the Army H. H. Arnold, Gen. Jacob L. Devers, and Gen. Brehon Somervell respectively. Following the assignment, equipping, and training of troops for overseas service, they passed from the control of these commands to that of the theater of operations, task force, overseas base, or defense command to which they were assigned. The commanders of these latter headquarters are under direct War Department control.

Army Air Forces directs the development and expansion of all phases of the army air arm. Army Ground Forces include the Infantry, Cavalry, Field Artillery and Coast Artillery, together with such newer commands as the Armored Command, the Tank Destroyer Command, the Airborne Command, and the Antiaircraft Command. In Army Service Forces are grouped the technical services—Quartermaster Corps, Ordnance Department, Chemical Warfare Service, Corps of Engineers, Signal Corps, Office of the Surgeon General, and the Transportation Corps, together with such staff divisions as the Office of the Adjutant General, the Office of the Judge Advocate General, the Special Services Division, Office of the Fiscal Director, and Office of the Chief of Chaplains.

Under the Commanding General of the Army Service Forces function the nine service commands which perform the administrative and housekeeping tasks of the vast military establishment in the United States, together with the Northwest Division with headquarters in Whitehorse, Yukon Territory. In the headquarters of the commanding general of the Army Service Forces are additional staff divisions through which the vast procurement program of the army is directed and administered. Under his command also functions the Provost Marshal General who directs the Corps of Military Police, the prisoner of war information bureaus, and the training of Allied Military Government personnel.

Army Air Forces.—The president's directive of 1942 assured a centralization of all aviation components under a single head, General of the Army Henry H. Arnold. His general staff, roughly comparable to that of the War Department, consists of: A-1 (Personnel), A-2 (Intelligence), A-3 (Operations, Commitments, and Requirements), A-4 (Matériel and Services), a Plans Division and a Training Division. On Aug.

22, 1945 the numerical strength of the Army Air Forces was announced by the War Department as approximately 2,300,000.

Army Air Forces statistics for an eight-week period in one theater present a striking example of the scope of our air operations. It has been estimated that between D-Day, June 6, 1944, and July 30, 1944, our bomber losses were approximately 2 per cent and our fighter losses approximately 1 per cent. (Bomber losses during late winter and spring (1944) had run between 3 and 4 per cent.) During the same period our air forces dropped 61,872 tons of bombs on strategic targets in Germany, Austria, Poland, Czechoslovakia, Hungary, Rumania, Bulgaria and Albania. In these raids we lost 601 of our bombers and 196 of our fighters, and destroyed 1,391 enemy aircraft in the air.

Army Ground Forces.—The present triangular division is organized into three regimental combat teams, each team consisting of an infantry regiment directly supported by a battalion of light field artillery (105 mm. howitzers). A fourth field artillery battalion (medium—155 mm. howitzers) lends general support to all three combat teams or performs specific missions as directed by the division artillery commander. The Garand rifle has replaced the Springfield and Enfield rifles as the basic infantry weapon. New and more powerful machine guns and new weapons such as the carbine, submachine gun, mortar and bazooka vastly increase the fire power of the infantry division. The general employment of 105 mm. howitzers in place of the old 75's as the light element of the division's artillery adds considerably to the division's punch.

Technical improvements in the design of our tanks, in their speed, resistance to enemy fire, maneuverability and fire power, have produced some of the best armored vehicles in the world. Among these are the M-4, medium and the M-5, light. In his address to the House of Commons, Aug. 2, 1944, Prime Minister Churchill paid high tribute to the American M-4 (Sherman) tanks: "In the hands of our troops," he said, "the Sherman tank has maintained its reputation gained in Africa, at every stage in battles in Italy and Normandy . . . we succeeded in mounting a 17-pounder gun on the Sherman—a remarkable feat—I saw with my own eyes an example of the work of the 17-pounder. Generals Montgomery and Dempsey brought me to the spot and invited me to count the broken down Panther (German) tanks which were littered about. I counted nine in the space of about a thousand yards. The generals told me that all these nine had been shot by the 17-pounder of one British Sherman tank. . . ."

Despite occasional successes such as that mentioned by the Prime Minister, the proved folly of pitting tank against tank resulted in the development of the tank destroyer and, in this country, of the Tank Destroyer School at Camp Hood, Texas. The tank destroyer, which in physical outline and general appearance bears a striking resemblance to the tanks it is designed to destroy, is a lightly armored, heavily armed vehicle capable of great speed and great maneuverability. The M-10 is a full-track vehicle the main fire power of which is a three-inch gun. The M-3 is an armored half-track mounting a 75 mm. gun.

The basic training of enlisted men and the training of officer candidates for the ground forces are accomplished in the various replacement training centers, specialist schools and officer

candidate schools which come under the jurisdiction of the Replacement and School Command.

The Antiaircraft Command is charged with the responsibility of guarding against, spotting, warning of the approach of, and combating enemy aircraft.

Army Service Forces.—The most variegated section within the army is the Army Service Forces, as is indicated under the subheading *Organization and Administration* in this article. The heroic and almost miraculous achievements of our Engineer, Transportation, Quartermaster and Medical Corps are a matter of common knowledge. The accomplishments of our Signal Corps, Chaplains, Special Services Division, in fact the accomplishments of all elements of the Army Service Forces are themselves the highest tribute to the individual soldiers, officers and civilian employes concerned and to the success of the reorganization which grouped these diverse elements under one head.

Despite the magnitude of the production problems that had to be solved in equipping our forces, on Aug. 10, 1945, the third anniversary of the presentation of the first Army-Navy "E" Award, it was announced that the award had been granted to 4,044 plants. Production levels which had mounted sharply in 1943 maintained a satisfactory level in 1944 and reached a peak early in 1945. Deliveries in 1944 were valued at 23.5 billions. Production figures have been in sharp contrast to figures established in the First World War.

During the First World War we produced a total of 132,000 machine guns; in two months of 1943 we produced 150,000 machine guns and 132,000 submachine guns. In 1918 we were producing small arms ammunition at the rate of 278,000,000 rounds a month. As the two-front war reached its climax of fury, we were producing this amount about every week. We were producing more than 18,000,000 artillery shells a month, as compared with 2,700,000 a month during the First World War. During the First World War we produced only 80 tanks. In 1943 we produced 5,000 tanks in a two-month period. We were making the Garand rifle at the rate of more than 80,000 a month and we were making more than 419,000 aircraft bombs a month.

However, the problem was not merely to supply our own soldiers with arms and equipment, but to supply also the armies of Britain, Russia, China and the numerous governments in exile.

The movement of supplies and equipment from the United States to the fighting fronts was a task ranking in size and importance with combat operations and war production. For every one of the more than five million men who had been moved overseas at the peak of deployment, it was necessary to transport initial equipment and supplies weighing five tons. Continuing maintenance after arrival in the theater averaged one ton per man per month. These supplies traveled 4,200 miles to Naples, 8,200 miles to Basra, 10,000 miles to Calcutta, and 6,200 miles to Brisbane. From San Francisco to the Southwest Pacific the average round trip required 129 days. The success of Army Service Forces in delivering the product of American industry to the fighting fronts, in sufficient quantity and on time, was unquestionably one of the vital factors in victory over the Axis.

Women's Army Corps (WAC).—See under that heading.

Personnel.—By May 1945 our army was over twice the size of the one we developed for the First World War. When that war ended we had an army of 4,057,101 officers and enlisted men of whom 2,086,000 were serving overseas, the majority in France. In May 1945 the comparable figures, including female personnel, were 8,291,336 and 5,472,282.

An executive order of December 1942 put an end to army enlistments and directed that the induction of men over 38 years old be ended. Prior to this order Congress had authorized the induction of 18-year-olds. While the army was in its early stages of growth to wartime strength, restrictions against the induction of illiterates and of men with minor physical defects were dropped. In the summer of 1943 the drafting of "limited service" men was stopped and the army released men who could not qualify for general service. Following the surrender of the last of the Axis powers in 1945, an intensive recruiting program for the Regular Army was instituted, looking toward eventual replacement of drafted men in the occupation forces who desired discharge. Selective service was also continued for the same reason, but drafting of men over 26 years of age was stopped. Recruiting for the Women's Army Corps also ceased.

In the early months of the war, promotions in both the enlisted and officer ranks were necessarily rapid. The tremendous expansion of the army necessitated the rapid filling of many positions which called for rank. By 1944, however, the pace had slowed down considerably. New regulations lengthened the time required in all commissioned grades before promotions could be made. Rapid promotions are permitted now in only the most exceptional cases.

The prewar army of 1940 had 100 general officers (brigadier general and above), which total amounted to two thirds of 1 per cent of all officer personnel. On V-J Day there were approximately 1,600 generals, or one fifth of 1 per cent of total officer personnel numbering 800,000. In September 1945 the War Department announced that 170 general officers had either left active duty, were about to do so, or were being reduced in grade as a part of the army's demobilization program.

Orientation, Training and Education.—While hostilities were in progress, military training became increasingly realistic and correspondingly severe. It was found that exposure to simulated battle conditions and what the soldiers described as a "rugged" training course paid off substantially in keeping casualties down and maintaining physical efficiency on the battle field. A series of marches of graduated length up to twenty and thirty miles under full packs increased endurance, and the running of obstacle courses developed agility. On the infiltration course, the trainee crawled under barbed wire, cradling his rifle in his arms, while machine guns sprayed bullets a few feet above his head. Instruction in house-to-house fighting was given in specially constructed "villages" where moving dummies were bayoneted and shot. In desert, jungle, and mountain training centers the soldier learned to care for himself under the conditions of terrain and climate which he would soon face in the field.

The soldier's schooling follows a logical pattern developed from experience. His earliest orientation to a new and unfamiliar life is gained largely on the drill field and through carefully planned classes. He is taught the use and care

of his rifle and other equipment and the fundamentals of military courtesy and law, and he receives instruction in personal and group hygiene. Full use is made of training aids which can be seen and handled and of charts and training films. The soldier is taught to drive and care for military vehicles, to communicate messages, to use his gas mask and compass, and to read maps. The basic training course, which stood at seventeen weeks at the close of hostilities, prepares him for duty as an individual replacement.

In the unit training which follows, the soldier learns teamwork with his comrades in the ranks and begins to appreciate the co-ordination of his company with others in his battalion, of his battalion with other units in his regiment, and of his regiment with supporting ground, air and supply forces. This type of training reaches its climax in field maneuvers on a divisional or higher level in which military problems are worked to a conclusion, with all arms and services participating.

The Army of the United States is one of the best-informed armies in the world. Weekly orientation lectures are compulsory in all basic training programs. These lectures ground the soldier in the history of the war and keep him abreast of military developments and the army's changing mission. The officers conducting the orientation program have been guided by a weekly "newsmag" summarizing operations and by other publications of the army's Information and Education Division.

One of the most important and successful of army orientation programs has been a series of films under the general title "Why We Fight," which portray enemy and Allied forces in action as well as our own. These films, directed by Col. Frank Capra of the motion picture industry, have been seen by every member of the army. Other army films have taught the trainee the grim realities of war and the pitfalls he must avoid. Effective use of humor has been made in correcting less serious errors.

As in 1917-18, but under a different plan, the army has made full use of the nation's colleges for the training of troops. Modern war requires an endless variety of specialists in the ranks, and the colleges were able to supply the basic knowledge on which purely military training in the use of specialized techniques could be based. Young men of seventeen enrolled in the Enlisted Reserve Corps and qualified inductees up to the age of twenty-two took part in the Army Specialized Training Program, which utilized the services of more than 200 American colleges and universities. An urgent need for combat forces in Europe caused a drastic reduction in the ASTP program in 1944, but it was revived for 17-year-olds in 1945 as the Army Specialized Training Reserve Program.

Off-duty education of a general nature has developed during the war into a program of substantial importance. The United States Armed Forces Institute, operating from Madison, Wis., has offered nearly 300 different correspondence and self-teaching courses in high school, technical, and basic college subjects. A large number of colleges and universities have co-operated with USAFI in making correspondence extension courses available to army personnel. USAFI's program was received with unmistakable approval by thousands of soldiers, who were thereby enabled to continue their education during the war. Certificates of courses completed are supplied upon application.

The Army on Fighting Fronts in 1945.—The groundwork for the defeat of Germany and Japan was laid in the fall of 1944. In October the German army was a cornered beast, under determined attack from three sides and a mounting storm from the skies, but still dangerous. Savage counterattacks could not, however, disguise the fact that the initiative was with the Allies on all European fronts. The fall of Aachen shortly after the middle of October proved that the "holy soil" of Germany could be seized and held against all the power which the Wehrmacht and the weakening Luftwaffe could muster. But Germany still held the advantages of interior lines of communication and prepared fortifications, and difficulties in moving supplies from America to the German border were a source of constant concern. In the east, the Red Army had begun the advance into Poland and East Prussia which ended with the fall of Berlin. The Russians were, however, engaging the bulk of the German army along a front twice as long as that in the west, and the Germans, in mortal fear of revenge for the outrages inflicted on Russian civilians, were resisting to the death. In northern Italy a conglomerate Allied force was inching forward and waiting for spring.

General MacArthur had established his position on Leyte in the Philippines, and, as the Japanese well knew, American occupation of the island group would cut their supply lines from the Indies as well as make feasible the invasion of their homeland. The defeat of a dangerous Japanese naval attack on our fleet at Leyte late in October confirmed Japan's inability to sweep the American Army back into the sea.

The fall of 1944 also brought a halt of Japanese expansion on the continent of Asia and the beginning of a recession. American, British, and Chinese forces began a push into Burma which was to end in 1945 on the borders of Siam. In south China an army of Chinese patriots aided by American training, supplies, and air support repelled a Japanese spearhead thrusting west into Kweichow province and began to threaten the Japanese corridor extending south to Indo-China. The strategy of cutting across south China forced a general Japanese withdrawal to the Yangtze River line by the following summer.

The clearing of the port of Antwerp in Belgium during November greatly improved supply to General Eisenhower's forces for the advance into Germany, and a general squeeze all along the western front began. The Russians moved into Hungary and Slovakia. German troops of second-rate quality began to be met on the western front, indicating that manpower was running low.

It began to appear in December that the winter fighting would be uneventful, when suddenly a heavy German assault drove a deep dent into the western front in Luxembourg and the Ardennes. The Battle of the Bulge, Germany's last major offensive effort, recalls the stone-wall American resistance at the northern and southern hinges of the salient and the heroic defense of Bastogne in southeast Belgium.

In January the eastern front in Poland "exploded," to quote German press reports. The Red Army began its carefully prepared general advance and in a matter of weeks stood on the German border. Despite last ditch German resistance in isolated strong points, the big squeeze was on in the east as in the west, and Poland's ordeal under Nazi rule was ended.

In February the Red Army established bridge-heads across the Oder River and American forces continued their progress through the Siegfried Line west of the Rhine, Germany's defense in depth against attack from the west. British and Canadian forces at the northern end of the front continued to press into Holland and succeeded in flanking the end of the Siegfried Line defenses. Flood conditions impeded the Allied advance into the north German plain country.

It was estimated that in the first two months of 1945 Germany had suffered nearly two million casualties. Prisoners began to be taken in large numbers on the western front.

Meanwhile General MacArthur had launched a full-scale invasion of Luzon early in January and the complete liberation of the Filipinos from their hated conquerors was in sight. In all of the Philippine operations, American forces were aided by Filipino guerrillas. Armed with American weapons, captured Japanese equipment, or their native bolo knives, the Filipinos took a substantial part in the freeing of their native land from Japanese rule.

American forces crossed the Rhine at Remagen on March 8, 1945, and the last natural barrier in western Germany became valueless. With the air forces blasting the way, American tanks and mobile artillery began punching into the heart of Germany, closely followed by foot troops. Disheartened German troops surrendered more and more readily to the advancing Americans. The First French Army, equipped by the United States, was beginning to bear its part in the struggle to force an unconditional surrender. Hitler in desperation was attempting to salvage a compromise peace with unofficial "feelers" and incitement to fanatical resistance, but it was clear that Germany lacked the manpower, productive capacity, transport, and morale to fight on three fronts. The end came on May 8, with the Allies on the Elbe River, the German forces in northern Italy in rout toward the Alpine passes, and the Russians in Berlin.

The Allied view that Japan was the weaker enemy was amply borne out by Hirohito's surrender offer of four months later. It was evident that, without changing the Japanese form of government and with millions of foot soldiers still undefeated in the home islands and the East Indies and on the continent of Asia, the Japanese nation could have been bombed out of existence. Acceptance of the surrender offer under terms subordinating the emperor's rule to the will of the Supreme Allied Commander is estimated to have saved a million Allied casualties.

All army casualties as reported through July 29, 1945 totaled 920,917, divided as follows: killed, 197,676; wounded, 570,766; missing, 34,734; and prisoners of war, 117,741. Of the wounded, 351,317 had returned to duty, and of the prisoners 95,709 had been exchanged or returned to military control.

ARNOLD, Henry Harley, United States Army Air Forces officer: b. Gladwyne, Pa., June 25, 1886. As Commanding General of the United States Army Air Forces from March 1942, General Arnold was one of the chief architects in the building of American air power from a force of some 20,000 men and a few thousand planes to a vast global organization of 2,300,000 men whose plane production needs were met with an output of almost 10,000 military aircraft monthly in 1944. On Feb. 28, 1945, the European and Pacific wars still to be won, General Arnold warned the

United States it would be the first target for enemy air attack in the next war, and outlined a program of postwar preparedness. Two days later, he revealed that the army's first jet-propelled combat plane was already in production. In July 1945, General Arnold attended the Truman-Churchill-Stalin conference in Berlin (Potsdam). On November 20, it was revealed that General Arnold had submitted his resignation as commanding general of the Army Air Forces. It was stated that following his retirement he will locate on the West Coast and will become an advisor to airplane manufacturers. General Arnold is a graduate of the United States Military Academy (1907); commissioned second lieutenant in the infantry, he transferred to the air corps, and become one of the first five army officers given flight training by the Wright brothers. In the First World War, he commanded a flying unit in the Panama Canal Zone. He was promoted General of the Army in December 1944.

ASTON, Francis William, English physicist: b. Harborne, Birmingham, England, Sept. 1, 1877; d. London, Nov. 21, 1945. In the world of science the name of Dr. Aston was synonymous with isotopes, the science of which he developed, in the years after the First World War, along with Prof. Frederick Soddy, who, like Dr. Aston, won the Nobel Prize in Chemistry.

Dr. Aston was educated at Malvern College and the universities of Birmingham and Cambridge. He was assistant lecturer in physics at Birmingham University in 1909, and the next year entered Trinity College and Cavendish Laboratory at Cambridge. During the First World War, he served as a technical assistant in the Royal Aircraft Establishment, and in 1920 he was elected a fellow at Trinity College. He developed a high-precision instrument known as a mass spectrograph, by which he proved that most elements consist of a mixture of identical atoms of different weight, or isotopes. With this instrument some of the greatest discoveries in modern times have been made. One of these was the discovery of heavy water; and by means of a modified form of this instrument, the existence of the now famous isotope of uranium—uranium of atomic weight 235—the element that led to the development of the atomic bomb, was discovered at the University of Chicago by Prof. Arthur J. Dempster in 1935. Dr. Aston received the Mackenzie Davidson Medal of the Roentgen Society (1920); the Nobel Prize in Chemistry and the Hughes Medal of the Royal Society (both 1922); the Joykissen Mookherjee Medal, Calcutta, and the Royal Medal of the Royal Society (both 1938). In 1922 he visited the United States to deliver a series of lectures at several universities. He was the author of *Isotopes* (1922), *Mass-spectra and Isotopes* (2d ed. 1942), and numerous articles for scientific periodicals.

ASTRONOMY. With the ending of the Second World War we can expect many observatories to renew or increase their activity. Meantime news has gradually come as to the fate of those in the war zone. It has been fully confirmed that Pulkovo and Simeis observatories were wholly destroyed, though some equipment was saved. The majority of that at Simeis was seized and carried to Germany; whether it has been recovered is unknown. The Kiev Observatory has been rebuilt and is back at work. Many others in the USSR were far from the front and able to continue their activities. The French observatories seem to have been mostly unharmed. The same may be said of Leyden in Holland, but Uccle Observatory in Belgium had some of its instruments confiscated. Hamburg Observatory is said to have been destroyed, Leipzig to be damaged and Potsdam to have escaped. Reports on the condition of other German and Austrian observatories are not at hand. Arcetri in Italy escaped. With priorities removed and personnel available once more, the 200-inch Mt. Palomar, California, reflector should be in use within a year or two. However, of all countries, far the most ambitious program, on a national and long-period basis, has been planned for the USSR. They hope to have numerous fine observatories, new and rebuilt, in full activity within a decade.

Comets.—No bright comet was visible during the year. Several faint ones, already known, were observed and three new ones. Two of these were discovered by D. du Toit at the Boyden South African branch of Harvard Observatory. Comet 1945a, found on April 9 in the constellation Leo, was 10 magnitude. Not being found on plates at the two Massachusetts stations of Harvard Observatory, it was not announced until June 12. Meantime, however, it had been successfully followed from the Southern Hemisphere. Comet 1945b, found on June 11 in Cetus, was also 10 magnitude. It had a declination of -20° and rapidly went further south. According to an orbit by Dr. Jorge Bobone, the orbital inclination was 156° and it had passed perihelion on May 17. Periodic comet Schwassmann-Wachmann 1925 II was the only such object visible at the beginning of the year. Comet 1943a (Oterma) was observed again on April 14, having a coma only 6" in diameter and being 17 magnitude. This was found on plates taken by G. van Biesbroeck, using the powerful 82-inch reflector of the McDonald Observatory, Texas. By July 5 it was 18 magnitude. Pons-Winnecke's Comet was rediscovered by H. L. Gilcas at Lowell Observatory on May 3. It was 14 magnitude. This comet has a period of 6.23 years and has been observed at every return since 1909. Comet Kopff also was rediscovered by Gilcas on May 7, being diffuse but with a nucleus and of 13 magnitude. Comet 1944d (van Gent) was observed on July 5 at Lick Observatory by G. Herbig and was 18.5 magnitude. Comet 1944b (Väisälä) was 15.5 magnitude on August 7. The third new comet was discovered on November 22, by C. L. Friend of Escondido, Calif. It was then 7 magnitude, hence the brightest of the year.

Meteors.—Nothing of outstanding importance happened in meteoric astronomy. The annual Perseid shower was extensively observed in America. While the number of very brilliant meteors was small, many observers, who were favored with excellent skies, had after-midnight rates of considerably over 100 meteors per hour on August 11/12. On May 4 at 3:38 A. M., E.W.T., an enormous bolide passed over eastern Pennsylvania

and burst near Wilmington, Del. Though the sky was heavily overcast, the whole heavens were lighted by the passage and bursting of this body, while over a large area houses were shaken by the air waves and thousands awakened by the accompanying noise.

Eclipse.—The total eclipse of July 9, though with totality of very short duration, was extensively observed from many stations on both sides of the Montana-Manitoba boundary, and, after the shadow cone had crossed the Atlantic, from Scandinavia and the USSR. Despite the difficulties of transportation many expeditions were able to reach stations along the path of totality, and most had good weather. For America, the Sun was low in the east, the eclipse occurring early in the morning. The corona appeared of the usual shape typical of sunspot minimum, having two great equatorial wings. From aircraft of the Royal Canadian Air Force, 35 spectra were taken, some from an altitude of 5 miles. B. Lindblad in Sweden obtained good cinema films of the flash spectrum, as well as moving-plate records with higher dispersion. Aircraft were also used there for photographs at a 2 to 3 mile height. Details from numerous Russian parties are lacking but they report great success.

Solar System, New Theories Concerning.—Theories of the formation of the solar system have proved so difficult to square up with known facts that, at present, there is none which has general acceptance. Recently two have been published which diverge from the catastrophic type that, on the whole, have been in favor for the past half century. That due to von Weizsacher starts with an already existing Sun which collects a sort of nebulous envelope from a relatively dense region of the general interstellar cloud, through which it would be passing. The cloud would be in turbulent motion, the gas and dust particles moving in all planes. Internal frictions would cause the formation of a disk-like envelope, comparable in extent to the present diameter of the system, and about one hundredth as thick. Details of the theory from here on are too complicated for review, but it seems to evade the great difficulties in former theories to account properly for the angular momentum of the planets and to explain Bode's law of planetary distances. The other theory by H. Alfven of Stockholm also supposes the Sun to enter a nebula, but one consisting of neutral atoms. These will be attracted by the usual gravitational forces, but when they reach a critical distance from the Sun they become ionized. Unlike neutral atoms, the ions will be affected more by the magnetic field of the Sun than by its gravitational field, and in general will be repelled. An equatorial disk will then be formed and caused to rotate by these electromagnetic forces. Again details are very complicated, but a real advance seems to have been made by the insistence on the importance of electromagnetic forces as well as gravitational in the genesis of the solar system.

Stars.—Unusual stars of various kinds are being constantly discovered, due mostly to the application of photography to astronomy. Adriaan van Maanen determined the parallax of the star Ross 882 as $+0.146$, finding its magnitude varied from 13.2 to 11.8. This means that its absolute magnitude is from $+14.0$ to $+12.6$. Its type is dM4e, which means that it is a M4-type dwarf with emission lines. Very few dwarf stars of such great intrinsic faintness so far have been found variable. W. L. Luyten continued his work on white dwarfs, several being found among the

components of faint double stars. One single star in the south circumpolar heavens, LPM 445, with a photographic magnitude of 17.4, is probably by far the faintest white dwarf known. Eclipsing variables continue to hold the attention of many observers. The simultaneous study of these objects, by both the photometer to determine the light curves and the spectrograph to secure records of the accompanying physical changes, has led to surprising hypotheses as to some stars having extensive outer envelopes, some emitting streams of gas which curve around the main star, etc. Leon Campbell has worked up the observations of W Lyrae, a long-period variable, which cover the period 1896 to 1945. He proved that the mean period decreased from 198 to 193 days by 1925 and has since increased to 199 days. Many long-period variables do not exactly repeat their behavior period by period both as to its length and their extreme magnitudes. Such stars are objects particularly suited for observation by amateurs and literally tens of thousands of observations are made by them every year. The data for the study of W Lyrae was, for instance, mostly furnished by them. Another nova in Aquila, which rose to about 7 magnitude, was discovered by Nils Tamm of Stockholm on August 28. In the month after its discovery it had dropped about two magnitudes. Spectrum plates on August 29 showed broad emission lines typical of such objects. Measures at the Dominion Astrophysical Observatory of the hydrogen lines indicated velocities for its expanding shell of gas to be from 2,150 to 1,330 km/sec. Its absolute magnitude was calculated as being -6.8 , and its distance about 8,300 light years. Examination of old plates of the region, showing stars down to 16.5 magnitude, do not show the nova. If it follows the general course of such objects, which quickly return to their pre-nova brightness, it will wholly disappear within a few years at most. On April 7, Milton Humason at Mt. Wilson photographed a faint object, about 7" from NGC 5195, which turned out to be a supernova, caught, however, about 2 months after it had attained its maximum brightness which was calculated to have been 11 photographic magnitude. The "recurring nova" T Pyxidis came to a maximum of 7.1 magnitude in November 1944. Previous outbursts had occurred in 1890, 1902 and 1920.

ASTROPHYSICS. See under PHYSICS.

ATOMIC BOMB. On Aug. 6, 1945, President Harry S. Truman, then en route back to the United States from the Potsdam Conference, electrified the world with the announcement that 16 hours earlier an atomic bomb had been dropped from a United States Army plane on Hiroshima, Japan, a city with a population (1940) of 343,968, on the home island of Honshu. "That bomb," said Mr. Truman, "had more power than 20,000 tons of TNT. . . . It is the harnessing of the basic power of the universe. . . . What has been done is the greatest achievement of organized science in history."

Three days after Hiroshima was bombed another bomb, differing in some respects from the first, was dropped on Nagasaki, another Japanese city on the west coast of Kyushu Island. The results in both cases were devastation. Gen. Carl A. Spaatz, United States Army Air Forces, estimated that 60 per cent (4.1 square miles) of Hiroshima had been wiped out, while navy

headquarters at Guam reported that a third of Nagasaki's industrial area had been razed.

The bombings brought results. On August 10 it was announced that Japan had offered to accept the terms of surrender set forth in the Potsdam Declaration of July 26, 1945, which were "unconditional." Russia's entrance into the war on August 8 may have been a contributing factor, but Japan's sudden capitulation almost immediately after the dropping of the second bomb, accompanied by the statement that other bombs would follow, is significant.

The story of the bomb, development of which, according to Mr. Truman, required practically four years of effort and cost approximately \$2,000,000,000, was the biggest and best kept secret of the Second World War. Aside from the scientists, few, if any, of the nearly 65,000 persons who worked on blueprints, handled materials, erected buildings and otherwise expedited construction of the bomb, had any idea as to exactly what they were doing or what it was all about.

For several years scientists in the United States and abroad had been smashing atoms, but until the president made his announcement, only those on the inside knew that atomic energy was being investigated for military purposes. Nevertheless, its possible use in warfare had been under consideration in the United States since 1939, when the War Department was informed that physicists had succeeded in splitting the uranium 235 atom. In December 1941 the Office of Scientific Research and Development, headed by Dr. Vannevar Bush, president of the Carnegie Institution of Washington, decided to make an all-out attempt to develop atomic energy for military purposes.

Early in 1942 a heavy water plant, constructed by the Germans, was discovered in Norway by British and Norwegian volunteer Commandos. This discovery confirmed the suspicion that Germany, too, was endeavoring to develop an atomic bomb, and that it really was ahead not only of the United States but also of Great Britain, which likewise was at work along the same lines. Thereupon Britain and the United States decided to pool their interests, and the whole project was placed under the supervision of Maj. Gen. Leslie R. Groves of the United States Army Engineers.

Numerous American scientists were called into service; Britain and Canada supplied their quotas, and three great plants were constructed: one at Oak Ridge, Tenn.; one at Richland Village in northwest Washington; and one in a remote section of the Alamogordo Air Base in New Mexico, about 30 miles northwest of Santa Fe. Among the numerous scientists who worked on the project, in addition to Dr. Bush, were Dr. R. C. Tolman, dean of the Graduate School, California Institute of Technology; Dr. Karl T. Compton, president of the Massachusetts Institute of Technology; Dr. James Bryant Conant, president of Harvard University; Dr. J. R. Oppenheimer, professor of physics, University of California and California Institute of Technology; and many others.

The first test of the bomb was made in the New Mexico desert on July 16. A steel tower, about 100 feet high, from which the experimental bomb was suspended, was "vaporized" by the explosion, which sent a varicolored cloud 40,000 feet into the air, and lighted up the surrounding country for miles. Two men more than five miles away were knocked down by the

pressure wave, and the shock was felt throughout an area within a radius of 250 miles. The light produced by the bomb is said to have been unearthly, and the force of the explosion something almost beyond comprehension.

Though there was universal rejoicing throughout the Allied countries when the war ended, it nevertheless terminated on a solemn note. The realization that human ingenuity had produced an instrument capable of destroying every living creature in the world in comparatively short order produced solemn reflections. Immediately the question arose: "Now that we have the bomb, what is to be done with it?" The only secret connected with the bomb is the method of constructing it. Some felt that, possessing this secret, the United States should keep it; others, insisting that the secret cannot for long be kept from other nations, urged that it be turned over to the United Nations Organization, and outlawed for military use. The matter was of such importance that Prime Ministers Clement R. Attlee of Great Britain and W. L. Mackenzie King of Canada came to the United States in November to discuss the subject with President Truman. On November 15 the three officials issued a joint statement, the substance of which was that the three nations had agreed to keep the technical processes for making the bombs a secret until such time as it is possible to devise "effective reciprocal and enforceable safeguards acceptable to all nations" against the use of atomic energy for destructive purposes. With this object in view, they recommended the appointment by the United Nations Organization of a commission to study the subject and make recommendations as to how their ideas can best be carried out.

[In the following paragraphs, Dr. W. V. Houston, professor of physics at California Institute of Technology, explains the scientific development of atomic energy.—Editor.]

ATOMIC ENERGY

Although the details of the nature and construction of the atomic bomb have not been released, enough information has been made public to indicate the general principles used in this application of atomic energy. Many of these principles had been common scientific knowledge at the beginning of the war.

The first experiment in which the energy of an atomic nucleus had been released was reported by Sir Ernest Rutherford in 1919. Using alpha particles, which are helium nuclei, to bombard nitrogen, he found that occasionally a nitrogen nucleus was transformed into a nucleus of oxygen, with the emission of a proton, or hydrogen nucleus, of high kinetic energy. In 1932, Cockroft and Walton, working in the Cavendish Laboratory at Cambridge, England, bombarded lithium with high-speed protons and found that occasionally a collision with a lithium nucleus produced two energetic alpha particles. These were both cases in which the nuclear structure of the atoms was involved, and in which the energy present in a nuclear structure was released as energy of motion of the particles.

The real stimulus to the idea of obtaining useful energy from atomic nuclei came in the years 1939 and 1940 with the discovery of the so-called fission of uranium. Uranium is the heaviest of the known stable chemical elements. As a matter of fact, it is not entirely stable because it decays radioactively, with, however, a very long lifetime. Uranium exists in the form

of three different isotopes, that is, atoms of the same chemical properties but of slightly different atomic weight. The nuclei of all of these atoms contain the same number of protons, that is, 92. In addition, they contain various numbers of neutrons. Uranium 234 contains 92 protons and 142 neutrons. U-235 contains 92 protons and 143 neutrons. U-238 contains 92 protons and 146 neutrons. These three isotopes are present in normal uranium to the extent of .006 per cent, 0.7 per cent, and 99.3 per cent respectively. It was discovered that U-235, when struck by a very low-speed neutron, would split into two parts. These two parts were not identical, and were not always the same. Usually, one part had an atomic weight in the neighborhood of 90, and the other an atomic weight in the neighborhood of 140. This fission was accompanied by the liberation of some two hundred million electron volts of energy. The most striking thing, however, was the fact that the products of fission were themselves unstable, and emitted additional neutrons. Hence, a reaction set off by one very low-energy neutron could result in the production of several relatively high-energy neutrons. It was realized that if these additional neutrons could be used to cause fission of additional uranium nuclei, the whole process would be self-sustaining, and a tremendous amount of energy might be released in a very short time.

In order that this reaction be self-sustaining, it is necessary that at least one neutron from each fission process cause another fission. These are four possible fates of neutrons released in such a process:

(1) The neutron can entirely escape from the reacting material. This is very possible if the mass of the material is small. Certainly, if only one uranium atom is involved, all of the neutrons produced will escape. Because of the existence of this process of escape, a self-sustaining reaction requires the presence of a relatively large mass of material.

(2) The neutron can be captured by uranium in such a way that it does not produce fission. In particular, U-238 has a large probability of capturing neutrons in this way to produce the unstable U-239.

(3) Neutrons can be captured by impurities, in particular, by nitrogen. This removes them from further consideration.

(4) Neutrons can be captured by U-235 to produce fission.

In order that the reaction be self-sustaining, it is necessary that the fourth process, the capture of neutrons by U-235 to produce fission, have a sufficiently high probability relative to the other three. Each of the other three processes can be reduced in probability by suitable measures. The probability of escape can be reduced by using a large volume of material. The probability of capture by U-238 can be reduced by slowing the neutrons to a very slow speed, since capture by U-238 has a maximum of probability for neutrons of several electron volts of energy. Probability of capture by impurities can be reduced by removing the impurities. This is easily specified, but difficult to carry out to the required degree.

To reduce the capture of neutrons by U-238 it was found desirable to introduce a so-called moderator. This moderator can be any material that does not capture neutrons, and which has a sufficiently low atomic weight so that a neutron loses a considerable fraction of its kinetic energy in an elastic collision. Suitable metals

for this purpose are deuterium, beryllium and carbon. Carbon appears to be the most available and the most easily used. If, then, masses of ordinary uranium metal are distributed throughout a large mass of graphite, the neutrons will spend a good deal of time in the graphite, will have their kinetic energies reduced to very low values, and when they happen to meet a piece of uranium, the probability for capture by even a small amount of U-235 appears to be sufficient to keep the reaction going. Under these circumstances about two hundred million electron volts of energy will be transformed into heat for each fission process that takes place, and the mass of uranium and graphite will be heated up. This heat can then be used for the production of power in the usual ways. Nevertheless, up to the present it has not been found practical to obtain much power in this way, because of the relatively low temperature at which such reactions have been carried out. Means for handling the reaction at a higher temperature will have to be developed before this can be a very effective source of power.

On the other hand, if U-235 could be obtained in any considerable quantities and with any considerable degree of purity, the use of a moderator would be unnecessary, and, in fact, the reaction would grow with explosive violence as soon as a sufficiently large quantity of material is brought together. This is presumably one way in which an atomic bomb might be made.

The separation of U-235 from the other isotopes is an extremely difficult matter, and although a great deal of effort has been put on the problem, little information is available as to what success has been obtained.

In the process described above for maintaining a self-sustaining reaction, some neutrons will be absorbed by U-238 to form the unstable U-239. This is found to emit an electron very quickly and so to become a new element, neptunium, which has an atomic number 93 and a mass number 239. This again is unstable, and soon emits another electron to form a second new element, plutonium. Plutonium has the atomic number 94 and the mass number 239. This plutonium is relatively stable, although it apparently decays in time with the emission of an alpha particle to form U-235. However, the plutonium itself will spit in two parts when it captures an additional neutron in the same way as U-235. In other words, plutonium 239 can be used as well as U-235 for the production of an explosion or for the maintenance of the self-sustaining reaction.

If the process described above for maintaining a self-sustaining reaction in a suitable grid of uranium and carbon is allowed to go on, a certain number of the U-238 atoms will absorb neutrons and be transformed into plutonium. This plutonium can be separated from the uranium by chemical means, which are normally much easier to carry out than means for the separation of isotopes. Hence, one may consider plutonium itself as a material out of which a bomb might be constructed.

There are many details of the methods necessary for producing the requisite concentration of U-235 or the requisite quantity of Pu-239 that have not been made known. The very fact, however, that success has been attained in the production of an atomic bomb indicates that there is no fundamental principle that prevents utilization of this form of atomic energy. It

therefore becomes reasonable to look forward to the time when useful energy can be obtained in this way. It is possible that energy can be obtained from more abundant elements than uranium, but even if this is not the case, there may be circumstances under which it is desirable to be able to transport energy in a highly concentrated form, such as for use in propelling airplanes and automobiles. The convenience of this highly concentrated form might make it desirable to use atomic energy, even if it were more difficult to obtain than the ordinary fuels that are now widely used. For further information on the atomic bomb see under CANCER; CHEMISTRY; ELECTRICAL AND ALLIED DEVELOPMENTS; METALLURGICAL ADVANCES; PHYSICS; WAR POLICY, UNITED STATES; WORLD WAR SECOND—*The Death Blow*.
W. V. HOUSTON.

ATTLEE, Clement Richard, British statesman: b. Jan. 3, 1883. Now Prime Minister of Great Britain, Mr. Attlee spent his early life as one of a large, well-to-do English family; attended Hailbury College, and Oxford's University College where he was graduated with honors in modern history. He then studied law; was called to the bar at the Inner Temple in 1905; and for the next four years, practiced as a barrister. Meanwhile, as a settlement worker in London's East End, he had his first contact with British working class life, and saw the meaning of poverty. Except for the period of the First World War, he lived in the East End until 1922, helping to better conditions in the Limehouse district. These experiences and the writings of William Morris and John Ruskin aroused his interest in labour politics, and he joined the Labour Party in 1907. From 1913-23, he was social science tutor and lecturer at the University of London's School of Economics. In the First World War, he served at Gallipoli, in Mesopotamia, and in France; he left the army in 1919 with the rank of major.

In 1919, Attlee became mayor of Stepney, also in London's East End, and in 1921, was elected a Labour member of Parliament for Limehouse, and appointed parliamentary private secretary to James Ramsay MacDonald, then leader of the Opposition. Re-elected to the House of Commons in 1923, he was named undersecretary of state for war, when MacDonald formed Labour's first administration in January 1924. Labour was defeated at the general election of October 1924, and for the next five years, Attlee was once more in the Opposition. When Labour returned to office for a second time in 1929, he was given a seat in the Cabinet as chancellor of the Duchy of Lancaster; he proved a shrewd, patient negotiator at the Imperial Conference of 1930. With the reorganization of the MacDonald administration as a national government in 1931, Attlee became postmaster general. He retained his seat in Commons when Labour was defeated in 1932, and after the general election of 1935, became leader of his party. The position of "Leader of His Majesty's Loyal Opposition" was first officially recognized in 1937, and Attlee was the first to receive the salary attached to it.

In May 1940, with the formation of Churchill's national government, Attlee was appointed lord privy seal and deputy leader of the House of Commons. Both these posts he gave up in February 1942 to become secretary of state for dominion affairs; at the same time, he was named deputy prime minister. He retained the latter post after leaving the dominions office in Sep-

ATOMIC BOMB

HOW ATOMIC ENERGY IS PRODUCED FROM A URANIUM ATOM

THE ATOM

ALL MATTER IS COMPOSED OF ATOMS. ALL ATOMS CONTAIN ONE (OR MORE):

ELECTRON
A NEGATIVELY CHARGED
PART OF THE ATOM

PROTON
A POSITIVELY CHARGED
PART OF THE ATOM

NEUTRON
A PART OF THE ATOM
CONTAINING NO ELECTRIC CHARGE

This Uranium atom is U-235. It differs from U-238 only in that it has 143 Neutrons in its nucleus, while U-238 has 146. Their physical and chemical properties are alike; but while a Neutron thrown at U-238 has no effect on it, one which hits U-235 splits it apart, because its fewer Neutrons make it less stable.

EACH SYMBOL REPRESENTS 15

HOW THE ATOM IS SPLIT

If an electron from outside the atom tries to get through, the atom's electrons repel it.

And a proton from outside is repelled by the atom's nuclear protons.....

WHEN

the neutron bullet hits the atom of U-235 and splits it, the electrons, protons and neutrons rearrange themselves and form two new atoms, each roughly half the weight of U-235, and a few other much smaller fragments. A typical pair of atoms would be Krypton and Barium.

56 electrons, 56 protons and 82 neutrons make up the normal Barium atom.
36 electrons, 36 protons and 48 neutrons make up the normal Krypton atom.

However, if All the fragments were gathered up and weighed, they would weigh only 99.9 per cent as much as the original U-235 atom. The missing 1/10 of 1 per cent of weight has been changed into energy which immediately appears as terrific heat, causing a violent explosion.

tember 1943 to become lord president of the council, still with a seat in the War Cabinet. In April 1945, he was one of Britain's delegates to the San Francisco conference on world security. As spokesman for his party, after Germany's surrender on May 8, 1945, he refused Churchill's invitation to continue the national (coalition) government until Japan's defeat, and left California on June 13, to campaign for the pending election. He had earlier (June 6) been created a Companion of Honour, in recognition of his services to Britain. Churchill invited Attlee to accompany him to the Three-Power Conference, convened in Potsdam July 17, in order to insure continuity and unity in British foreign policy "no matter who wins the elections." This was the first time an opposition leader in British politics had been invited to accompany the government's representatives to an international conference. The conference adjourned to permit Churchill and Attlee to return to London to receive the results of the general election, announced July 26. The Labour Party's overwhelming victory gave Mr. Attlee his first opportunity to form an administration. On Nov. 10, 1945, Mr. Attlee arrived in Washington, D.C., with Prime Minister Mackenzie King of Canada for discussion with President Truman of the atom bomb problem. On November 13, he addressed a joint session of the United States Congress, explaining to American legislators the aims of the British Labour Party—planned economy at home, international co-operation abroad. On November 15, Prime Ministers Attlee and King and President Truman announced their joint decision to share the atomic bomb secret with other United Nations "just as soon as effective enforceable safeguards against its use for destructive purposes can be devised." Before returning to London, Prime Minister Attlee addressed a session of the Canadian parliament in Ottawa (November 19).

AUSTRALIA, Commonwealth of. A self-governing dominion of the British Commonwealth of Nations, located in the southern hemisphere to the southeast of Asia. The Australian Commonwealth, which has an area of 2,974,581 square miles and a population (June 30, 1944 est.) of 7,306,637, comprises five states and two territories within the continent of Australia, the island of Tasmania constituting a sixth state. These constituents of the Commonwealth, their populations as estimated on June 30, 1944, and their areas, are as follows: New South Wales (2,870,956), 309,433 square miles; Victoria (1,997,804), 87,884 square miles; Queensland (1,065,414), 670,500 square miles; South Australia (621,998), 380,070 square miles; Western Australia (485,407), 975,920 square miles; Tasmania (245,434), 26,215 square miles; Northern Territory (5,179), 523,620 square miles; and Federal Capital Territory (14,445), 939 square miles. The six states, formerly self-governing British colonies, were federalized as the Commonwealth of Australia in 1901. The Commonwealth also administers Papua, the southeastern portion of New Guinea (pop., white and native, 340,070), 90,540 square miles; Norfolk Island (896), 10.2 square miles; and Antarctic territories, other than Adélie Land, south of 60° S. latitude and between 160° and 45° E. longitude. In addition, the dominion holds a League of Nations mandate for the Territory of New Guinea (pop., white and native, 891,165), 93,000 square miles; and shares with the United Kingdom and New Zealand the mandate for

Nauru (2,672), 8.43 square miles. A bill introduced into Parliament in July 1945 provided that Papua and the Territory of New Guinea should be amalgamated temporarily until six months after conclusion of hostilities.

Canberra is the federal capital of Australia.

The People.—The aborigines of Australia are fast dying out, only about 48,000 of full blood remaining; reserves have been provided for them, and laws enacted for their protection. European settlement dates from 1788, when convicts from Great Britain landed at Botany Bay. Some 23,000 of the present population are Asiatics, and most of the remainder are of British stock, immigration having been encouraged in the past through governmental assistance. A policy of restricted immigration found general acceptance among Australians, who feared that the entry into the country of large numbers of Asiatics would lower the high standard of living.

The capitals of the states and territories, and their populations as of Dec. 31, 1943, are as follows: New South Wales, Sydney (1,398,000); Victoria, Melbourne (1,170,000); Queensland, Brisbane (370,500); South Australia, Adelaide (362,500); Western Australia, Perth (263,000); Tasmania, Hobart (70,800); Northern Territory, Darwin (4,400); and Federal Capital Territory (12,200).

Education.—Education is under the control of the state governments. Primary education is free, compulsory and secular. In addition to state, or "public" schools, there are so-called "private" schools, managed privately principally by religious denominations and catering to all classes of the community. In 1941 there were 9,535 state schools with 886,655 pupils; and comparable figures for private schools were 1,863 and 224,355 respectively. Higher state schools were available in all states for pupils completing primary grades. The state universities had a total enrollment of 10,761 students in 1942.

There is no state-established religion, and no religious tests for admission to any of the rights and privileges of citizenship. At the 1933 census, 99 per cent of Australians professed the Christian faith. The Church of England has the greatest number of adherents (2,565,118 in 1933), and the next largest denominations were, in order of size, the Roman Catholic (1,161,455), Presbyterian (713,229), Methodist (684,022), other Christian (603,914), and Jewish (23,553). In the intercensal period 1921-33, the greatest proportional increases were recorded by the Church of England, the Roman Catholics, and the Presbyterians.

Government.—Legislative power for the Commonwealth as a whole is vested in a federal Parliament consisting of a governor general, representing the British monarch, a Senate and a House of Representatives; the governor general acts on the advice of the Cabinet, composed of elected members of the majority party in Parliament. H.R.H. the Duke of Gloucester, brother of King George VI, took the oath of office as governor general on Jan. 30, 1945. The Senate consists of 36 members, chosen for six years, being six for each of the original six states; in general, one half is renewed each three years, though in case of a deadlock with the lower house the Senate may be dissolved and a new one elected in its entirety. As nearly as may be, the number of representatives is twice that of the senators, all elected for three years unless the House of Representatives is sooner dissolved; the House had a membership of 75 in 1944. At the general elec-

tion on Aug. 21, 1943, the Labour Party was returned to office with a decided majority, obtaining 49 seats in the House of Representatives and 22 of the 36 renewed in the Senate. John Curtin continued as Labour prime minister until his death on July 5, 1945. Francis M. Forde, deputy leader of the Labour Party, filled an interim premiership until July 12, when Joseph Benedict Chifley (born at Bathurst, New South Wales, Sept. 22, 1885) was sworn in as prime minister. Chifley retained his Cabinet post of Commonwealth treasurer, and enlarged the Cabinet by creating the two new portfolios of Housing and Immigration. Legislative powers of the federal Parliament comprise defense, external affairs, finance, banking and currency, commerce, shipping, railroads, posts and telegraphs, census and statistics, copyright, and arbitration in interstate industrial disputes. Money bills must originate in the lower house, and may not be amended by the Senate.

The relationship between the government of the Commonwealth and the governments of the constituent states is analogous in many respects to that obtaining in the United States between Congress and state legislatures. In Australia, too, state loyalties are intense. The Parliament of each state exercises legislative control over such matters as land settlement, agriculture, water conservation, fisheries, forestry, mining, education and police, and generally is reluctant to relinquish these powers. Early in 1944 the Commonwealth government sought 14 additional legislative powers for postwar reconstruction, these requests covering such subjects as employment, unemployment, and the production and distribution of goods, all matters hitherto reserved to the states. Since these proposals necessitated amendment of the Australian Constitution, they were submitted to the people by referendum on August 19, with the result that the electors refused by a substantial majority to transfer these powers from the states to the federal government; the government obtained 1,963,400 votes, and its dissidents 2,305,418.

Finances.—While Australia's expenditure on defense was only £A14,000,000 in 1938–39, the last financial year prior to outbreak of the Second World War, in six years of that conflict (down to the end of the fiscal year June 30, 1945) Commonwealth defense expenditure totaled £A2,111,000,000; of this sum, £A717,740,000 was raised from revenue, and the rest was provided by loans. Total expenditure for the year ended June 30, 1945, was £A609,000,000 (£A149,000,000 for nonwar purposes); it was financed by taxation (£A304,000,000), other revenue receipts (£A39,000,000), public loans (£A234,000,000), and the temporary use of Treasury balances (£A32,000,000). In 1944–45 war expenditure amounted to £A460,000,000, of which £A26,000,000 were expended overseas. This compared with a war expenditure of £A544,416,000 in 1943–44, the decrease of £A84,416,000 being due to a reduced program of capital works necessary for war purposes, and to the need for diverting manpower from the armed forces and from the production of munitions in order to provide essential supplies required by Great Britain and the Allied countries. During the war period Australia repaid £A12,000,000 of the £A18,000,000 borrowed for defense and war purposes, and, in addition, overseas debt of the states and the Commonwealth, totaling £A62,000,000 was repatriated; the latter accomplishment saved £4,000,000 sterling annually in overseas interest.

The budget for 1945–46, the first for six years to cover 12 months of peace, estimated that revenue would amount to £A340,284,000 (as compared with £A343,000,000 in 1944–45). While the special tax of 1s. 6d. to the pound on taxable income to meet the cost of social services was retained, personal income taxes were reduced and sales taxes were lowered over a wide range of commodities; the net effect was that the combined individual levies, including those on members of the armed forces, would average about 12½ per cent lower for the year than the existing income tax levy alone. War expenditure in 1945–46 was estimated at £A360,000,000, and nonwar expenditure at £A132,000,000, making a total of £A492,000,000. Despite the rapid reduction in strength of the forces, expenditures for pay and allowances for members of the armed forces would remain high, and health and social services showed an increasing cost.

Lend-lease and reciprocal aid (lend-lease in reverse) were vital wartime factors in Australia's external financial position, the flow of essential supplies during that period being unimpaired by financial considerations. It was estimated unofficially that the value of lend-lease goods received in Australia down to the end of March 1945, was £A350,000,000, while Australian expenditure from April 1942 to June 30, 1945, on reciprocal lend-lease supplies and services for the United States Forces in the Southwest Pacific area was £A258,000,000. One fifth of Australia's total war expenditure in 1944–45 was on account of reciprocal aid. The Commonwealth and New Zealand provided 95 per cent of the food needed by the United States forces in the Southwest Pacific, as well as clothing, technical and aircraft equipment, transportation and communications, and buildings and strategic works. The huge cost at which Australia honored her obligations to the United States strained the financial resources of the country and depressed the living standards of her civilian population. With the cessation of lend-lease and reciprocal aid, however, Australia, in common with other members of the sterling area, faced an acute shortage of dollars and a consequent necessary restriction of imports from dollar areas.

Australia at War.—Voluntary enlistment of an expeditionary force for service anywhere in the world followed immediately on outbreak of war in 1939, and compulsory training for home defense was reintroduced. All citizens were registered in a manpower pool after the collapse of France in 1940, and mobilization was further extended in 1942 to meet the Japanese menace. By 1942 the strength of the Royal Australian Navy had been increased sixfold, and the Royal Australian Air Force was fortyfold stronger. A corps of three divisions fought throughout the Middle East, and the greater part of a fourth division assisted in the campaign in Malaya after Japan struck. With the collapse of Singapore, Australian troops returning from the Middle East were diverted to Java to join small contingents of British and United States forces, and others were sent from the Commonwealth to Timor, where a fruitless attempt was made to defend both the Netherlands and the Portuguese areas of the island. Then the Australians, with forces which ultimately totaled ten divisions, embarked upon the campaigns in Papua and the Territory of New Guinea; United States troops fought alongside them until November 1944, after which operations were continued by the Australians and New Zealanders alone. By Aug. 14, 1945, Australian

casualties had totaled 95,561 (army, 78,086; navy, 2,816; air force, 14,659). Tales of indescribable cruelty were related by the few Australians to survive capture by the Japanese.

External Affairs.—As a member of the British Commonwealth of Nations, Australia deals with the government of Great Britain through her own high commissioner (virtually, a minister), not through the governor general, whose constitutional position is comparable to that of the British monarch. In the Commonwealth is a like British high commissioner, and similar arrangements exist with respect to New Zealand, Canada and India. Australia also exchanges ministers with the United States, China, the Soviet Union, and the Netherlands, and (since February 1945) has a minister at large in South America. Nelson T. Johnson, American minister to the Commonwealth, resigned February 14 and his successor has not yet been appointed (Nov. 1, 1945). Sir Frederic Eggleston was appointed Australian minister in Washington in 1944. At international conferences, during 1945, Australia repeatedly made clear her determination that the smaller components of the United Nations must be consulted regarding postwar settlements (see *Principal Events*, below).

Labor's Position.—Australia is a highly unionized country, 157 per thousand of the population being trade unionists as compared with the 91 per thousand Americans who are members of the AFL or CIO. In 1944 there were 381 unions, of which 117 were organized on a national basis; these 117 contained 84 per cent of the total membership of 1,100,000. Membership is organized on a craft basis, although a movement toward consolidation on an industry basis gained some impetus during the Second World War. Organized labor is active in politics, the Labour Party, oldest of the three main parties in Australia, being one of the world's most powerful. Since Oct. 3, 1941, the Commonwealth has been governed by a Labour administration; it was returned to power after the general elections of Aug. 21, 1943, the present government being the eighth formed by Labour of the 24 administrations since the Commonwealth was formed on Jan. 1, 1901. In Labour administrations, members of the Cabinet are elected by caucus vote, the prime minister then deciding the ministry each should head.

The instrument by which the great majority of Australian workers have their wages, hours and conditions of employment regulated is the Court of Conciliation and Arbitration, an impartial tribunal which makes awards binding on both workers and managements. While the system has not entirely eliminated strikes, it has helped to eliminate violence and the frequency of industrial disputes. A strike or lockout now only occurs if unionists or an employer should decline to recognize an award; in either case, court action for enforcement of the award, or the "deregistration" of a union may follow.

Social Services.—Australia has been one of the pioneers in social legislation, state governments having for years past provided pensions for the aged, invalids and widows, allowances to families with children, and low-cost housing for workers. The Commonwealth government has also entered the field, introducing a child endowment scheme in 1941, widows' pensions in 1942, and, in 1943, extending existing maternity allowances to cover all births without regard to income, granting allowances to wives of invalid pensioners, and providing funeral benefits for invalids and old-age pensioners. In 1943, also, legislation provided

that medical prescriptions be dispensed free of cost to patients, and that a sustenance allowance be granted to a worker undergoing medical treatment. An act passed through Parliament in March 1944 provided payment to persons whose normal earnings have been interrupted through unemployment or sickness and who are not qualified to receive service, invalid, old-age or widows' pensions. In August 1944 all Australians, irrespective of income, became entitled to free hospital treatment, the federal government paying to the hospitals 6s. 2d. a day per patient. There are 6,387 medical practitioners to serve Australia's population of rather more than 7,000,000.

The outlay on social services represents nearly one half of all nonwar expenditures. The bulk of the expenditure was met from consolidated revenue generally and partly from payroll tax until the end of the 1944-45 financial year. The 1945-46 budget proposed to charge the whole of the social and health services expenditure to one fund, termed the National Welfare Fund, and as part of a general revision of taxation, a social services contribution was to be imposed from Jan. 1, 1946; the proceeds of the contributions, together with the collections from the payroll tax, were to be paid into the National Welfare Fund. The estimated income of the fund in 1945-46 was £A46,000,000, against an estimated expenditure of £A65,000,000; the shortage of £A19,000,000 was to be met from the balance of £A53,000,000 in the fund at June 30, 1945.

Agriculture and Livestock.—Approximately, 38 per cent of the country is unoccupied or is government-owned; 53 per cent is held under lease or license; 7 per cent has been alienated; and 2 per cent is in process of alienation. Some 500,000 men were engaged in rural production before the war, but by mid-1943 the number had fallen to 350,000. Early in 1944 a program was begun of releasing approximately 2,000 men monthly from the armed forces to help meet minimum food requirements. Nevertheless, Australian food production for Allied nations and liberated countries was of major importance, and during the war the government organized the Commonwealth's rural resources on national lines for the first time. At the beginning of 1945, the annual expenditure on food for the United States, British, and Australian armed forces exceeded £A100,000,000. Food production for 1943-44 was as follows:

	'000's omitted		'000's omitted
Milk for all purposes, thousand gals.	1,210	Sugar, tons	570
Butter, tons . . .	175	Peanuts, tons	13
Cheese, tons . . .	45	Canned fruits, cases	3,500
Eggs, dozen . . .	100,000 ¹	Dried vine fruits, tons	95
Beef and veal, tons	560 ¹	Potatoes, tons	599
Mutton and lamb, tons	477 ¹	Blue peas, bu.	600
Pig meats, ² tons .	143	Green peas, tons . . .	72
Wheat, bu.	109,558	Navy beans, tons . . .	5
Barley, bu.	7,589	Tomatoes, tons . . .	163
Rice (paddy), tons	64	Other vegetables for human consumption, tons	502

¹ For calendar year 1944.

² Incl. bacon and ham at its fresh equivalent.

Food production estimates for 1944-45 were completely upset because Australia experienced one of the worst droughts in the history of the country. The farm production suffered a loss that was estimated to amount to over £A60,000,000. Milk losses directly attributable to the drought were estimated at 200,000,000 gallons; meat losses, 100,000 tons; and wheat losses, 70,-

000,000 bushels. Australian farmers hoped to lift the wheat acreage for 1945-46 to 11,500,000 acres, more than 3,000,000 acres above 1944-45. Estimates were that, given a favorable growing season, the crop may reach 150,000,000 bushels—three times the production for 1944-45; this crop would leave a surplus of 70,000,000 bushels for export. Sugar production, which had not been affected by drought, was put at 640,000 long tons for 1944-45.

At the end of 1944 there were 123,173,962 sheep in Australia, a decrease of nearly 2,000,000 from the record figure of 125,000,000 in 1942, but an increase of approximately 12½ per cent over the number in 1939. The drought was largely responsible for a further decrease to 105,000,000 in March 1945. The number of lambs marked remained fairly steady at about 32,000,000 for each of the war years. Cattle have increased by over 1,000,000, or 8.9 per cent, since 1939; the increase has been chiefly in beef cattle, which numbered 9,000,000 in 1942, while dairy herds remained at their prewar numbers of 5,000,000. The total number of cattle, both beef and dairy, at the end of 1944 was estimated at 14,183,676. Pig raising was given a marked stimulus by the war, the number of pigs in March 1945 amounting to 1,630,000.

Production.—More wool is produced in Australia than in any other part of the world. Wool production in 1943-44 was estimated at 1,164,308,000 pounds. Owing to the drought conditions, the crop in 1944-45 was expected to be less by 132,000,000 pounds. In recent years the Commonwealth's wool textile industry has advanced steadily, in 1940-41, 407,479 bales being utilized locally. Production of minerals declined at outbreak of war because an appreciable proportion of skilled manpower entered the armed services, but with formation early in 1942 of a Directorate of Minerals the output of vital war minerals was greatly increased. Gold production in 1943 amounted to 750,863 fine ounces, valued at £A7,846,517. Compared with prewar figures, copper production increased by more than 50 per cent, and antimony by 30 per cent, while tungsten is being mined on a scale that would have been thought impossible before the war. Only the United States is a greater producer of lead and zinc than Australia. In 1943 a copper ore deposit that will yield about 140,000 tons of metal was discovered at Mount Isa, a well-established silver-lead and zinc production center. The existence was also proved of sufficient quantities of bauxite to guarantee Australia's aluminum requirements for years to come. Tantalum and beryllium are mined, as well as tin, iron, and mica, and there is an unceasing search for petroleum deposits.

During the year ended June 30, 1943, 26,414 factories engaged 759,045 persons and paid wages amounting to £A208,866,843. The total output value was £A850,348,656, of which some £A352,002,056 represented the value added by manufacturing. Australia is producing many products previously imported, notably plastics, printed textiles, canvas duck, auto tire cord, rolled aluminum sheets, soda ash, potassium salts, plywood, newsprint, rubber-insulated cables, tin plate, tool steels, wood pulp, wallboard, airplanes, airplane spark plugs, optical glasses, and watch movements. For the military purposes of the Commonwealth and Allied nations, Australia manufactured large quantities of blankets and clothing, as well as various drugs, including cholera vaccine and several antitoxins, ether, hypo-

dermic syringes, and sulfaguanidine, the last used for the prevention and cure of dysentery.

External Trade.—Total Australian trade in 1943-44 had a sterling value of £327,132,221 (£312,348,165 in 1942-43 and £242,652,664 in 1938-39), of which £210,028,921 was in imports and £117,103,300 represented exports. The United Kingdom took 38.9 per cent of the exports, the bulk of which were foodstuffs, and 28.3 per cent went to the United States. During the financial year 1943-44, the exports of Australian foodstuffs, in millions of pounds, were as follows: butter, 103; cheese, 29; meats, 312; dried fruits, 155; and canned fruits, 17. Over the same period, 12 million dozen eggs were also exported. Increased imports occurred mostly in defense materials, raw and semimanufactured materials for industry, capital equipment for new and expanding manufacturing plants, and other "essential" commodities; the imports of nonessential goods were severely restricted.

Communications.—The *railroads* of Australia totaled 27,918 route miles in 1943; 27,213 were owned or operated either by the Commonwealth or the state governments, and 705 miles by private interests. In 1942-43, 41,906,000 tons of freight were carried, and 518,979,000 passengers transported, the train mileage being 96,110,000, compared with 1938-39, last prewar statistical year, these figures represented percentage increases of 51.39, and 27 respectively. In 1945 Commonwealth and state authorities agreed to spend some £76,000,000 through the next seven to eight years to standardize all railroad gauges at 4 feet, 8½ inches. The first and major step was the conversion of all Victorian and South Australian lines, where the present gauge is 5 feet, 3 inches, and an independent standard-gauge line will then be constructed from the Western Australian port of Fremantle to Perth and Kalgoorlie; simultaneously with these undertakings, the broad gauge line from Port Pirie, South Australia, to Broken Hill, New South Wales, will be converted.

Highways had an aggregate length of 488,749 miles in 1944. There were two outstanding achievements in the program of strategic highways constructed during the war: the North-South Road from Alice Springs, in central Australia, to Darwin, Northern Territory, built at a cost of £A2,840,000; and a highway from Mount Isa, in Queensland, to Tennant Creek, Northern Territory, costing £A1,100,000. The number of motor vehicles registered at June 30, 1945, was 853,106, (503,025 automobiles, 57,228 motorcycles, 292,855 commercial vehicles).

Shipping statistics were not available during the war. A Directorate of Shipping established July 1, 1942 reduced the tonnage of nonessential general cargo by 52 per cent within 12 months, and the carriage of defense cargoes was increased by 39 per cent, of ironstone by 78 per cent, and of steel and pig iron by 87 per cent. Much special harbor equipment was built, including mobile cranes and self-propelled floating cranes, and an effective ship salvage service was created. Sydney's new graving dock, largest in the Southern Hemisphere and one of the biggest in the world, was completed in March 1945 after four years of work. The greatest engineering undertaking in Australia's history, the dock, which cost £A9,000,000, is 1,116 feet long, 154 feet wide and 45 feet deep, with a water capacity of 57,000,000 gallons; the dock is equipped with six cranes, two of 50 tons capacity, and contains seven and one-half miles of rail tracks.

Civil aviation made great strides during the war years. In the year ended June 30, 1945, civil transport planes carried 2,011 tons of mail; 2,338 tons of freight; and 320,377 paying passengers. There were 223 public airfields in 1945 and 383 landing grounds throughout the Commonwealth; numerous additional facilities had been provided for military aircraft. The total distance flown by regular air services in 1944-45 was 12,631,544 miles. In August 1945 the airways of Australia were nationalized, a National Airlines Commission expropriating the properties of private airlines and operating a system of national routes. This nationalization has been contested by the High Court on behalf of three major airways companies. The Department of Civil Aviation continues to provide such ancillary services as landing fields and radio and other navigational aids.

Telegraphs are operated by the Commonwealth government. Before the outbreak of war Australia led the world in the use of telegraphic services, an average of 2.6 messages annually per head of the population comparing with 1.6 per head in the United States, next highest. In 1942-43, 29,569,535 telegrams were despatched, 50,129 miles of wire being used for telegraph only, and 143,992 miles for both telegraph and telephone purposes; the armed forces were also using 172,870 channel miles of voice-frequency carrier telegraph systems provided by the Commonwealth government.

Telephone service is also provided by the government. In 1943 there were 6,371 telephone exchanges, with 540,261 lines and 766,846 instruments; this represents one telephone to each 141 inhabitants, Australia holding third place among countries of the world. During the war, telephone channels were provided linking Darwin, in Northern Territory, Alice Springs, in central Australia, and all intermediate points, to both Adelaide and Brisbane; and similar facilities were provided for points in northern Queensland.

External communications by submarine cable and wireless telegraphy are maintained by Cable and Wireless, Limited. In 1942-43, 2,964,732 cablegrams were received and dispatched. Wireless telegraphy links Australia with New Zealand, the territories of New Guinea and Papua, and various small islands in the Southwest Pacific, while a "beam" system affords direct communication with Great Britain and the United States. In 1942-43, 38,043,431 words were transmitted and received overseas by beam wireless.

Radio for domestic listeners is provided by the Australian Broadcasting Commission, operated by the Commonwealth government, through 29 transmitting stations (1944). Overseas programs were received at three stations and broadcast over national stations. Alternative programs were available through commercial broadcasting stations, of which 98 were in operation in 1944. Australia ranks sixth amongst countries of the world in relation to radio licenses per head of the population. In 1944, 1,454,302 licenses were taken out, which represents 19.57 per 100 of the population.

Principal Events of 1945.—The end of the war after six years of full Australian participation was, of course, the year's most momentous event. A population of little more than 7,000,000 people had provided more than 600,000 volunteers for overseas service in Europe, Africa, and Asia, and nearly one sixth of the men had become casualties. The dimensions of the Commonwealth's war effort against Japan had been second only to that

of the United States, and therefore it was understandable when Australia strongly resented the slight recognition of her contribution to victory accorded by the major powers. The minister for external affairs stated in Sydney on July 29 that the Potsdam "ultimatum" to Japan had been drawn up, delivered, and published without Australia's knowledge or concurrence, and plainly intimated that his country expected to share, not of grace but of right, in the making of armistice and peace arrangements. An even stronger protest followed the announcement on August 17 that the United States Department of State had rejected Australia's claim to a footing of equality in the peace discussions with Japan, and that Gen. Sir Thomas Blamey, commander of the Australian forces, could only "accompany" the representative of Great Britain at the surrender ceremonies. The Australian government promptly took up the matter direct with General MacArthur, and as a result the United States acceded to the Commonwealth's claim to be represented directly "in full recognition of the outstanding part Australia played in the war against Japan." The government, while professing satisfaction with this arrangement, expressed itself as deeply interested in interpretation of the peace terms in such manner as to eliminate all fears of future Japanese aggression.

Herbert Vere Evatt, Australian minister of external affairs, had already emerged during the United Nations Conference on International Organization, at San Francisco, as a most forceful champion of the rights of the smaller of the United Nations. As chief Australian delegate, he put forward 31 amendments to the charter, and 20 of them were accepted. The numerous clauses for which he had the major responsibility were those obliging signatory nations to include full employment, higher living standards, and the observance of human rights among their aims. Shortly after the Council of Foreign Ministers of the five major powers opened its discussions in London in September, Evatt arrived from Australia determined that the smaller nations should have their say. He put out a statement declaring that his government "is intent on making its contribution to a just and lasting peace," and because of his firm attitude all the British dominions and India were shortly invited to nominate representatives to attend the forthcoming meeting regarding the Yugoslav-Italian frontier.

On Oct. 14, 1941, less than two months before Japan struck, John Curtin became Labour prime minister of Australia. With the Commonwealth threatened by invasion, he imposed upon the country more stringent rationing and manpower controls than those accepted by any other of the United Nations, and gave unstinted support to General MacArthur in the ensuing campaigns against the enemy. Unfortunately he did not live to see victory brought to complete fruition, dying in office on July 5, 1945. Pending a vote to be taken by the Labour Party, Francis M. Forde, its deputy leader, was sworn in as the 15th prime minister of Australia. He served only until July 12 (the shortest term on record), when the party selected Joseph Benedict Chifley, Commonwealth treasurer, to the premiership and to leadership of the Labour forces. The selection was a popular one in the country. For many years a member of the Railway Locomotive Engine Drivers Union (as a locomotive engineer in New South Wales), Chifley had been Curtin's ablest colleague and his closest friend and confidant.

In August newly appointed Immigration Minister Arthur Augustus Calwell made a statement on postwar plans for populating Australia. He set the target in the immediate postwar years at 70,000 immigrants a year, and warned that any scheme which ignored the housing shortage which has resulted from the diversion of all manpower into war work, or which attempted to bring in more people than could be absorbed, would certainly fail. Parliament was also told by him that it had been agreed in principle with Great Britain that free passages should be granted to British demobilized service-men and women and their dependents wishing to emigrate to Australia.

The government also issued a White Paper outlining its planning for full employment in the postwar period; in the main it would be developmental public works on such projects as irrigation, railways, and roads. An important legislative act was the restoration of control of the state-owned Commonwealth Bank by a single governor instead of by a board; this was in conformity with the belief of the Labour Party that a board consisting of private bankers would not be likely, under certain circumstances, to administer the bank in the interests of the people. In major matters of economic policy the Commonwealth treasurer now has authority over the governor of the bank, and for the first time the bank can compete with private financial institutions in making loans for business as well as for agricultural purposes; the Commonwealth Bank has also been given control of the private trading banks in matters affecting the national economic policy. Among other important decisions taken during the year was that to standardize railway gauges throughout Australia (see *Communications*, above); all citizens have been provided with free hospitalization; gratuities have been added to the deferred pay already available to servicemen on discharge; and the payments by way of baby bonuses, child endowment, and old-age pensions have been increased.

Parliament enacted a measure introduced by Minister for External Territories Edward J. Ward, which provided for the restoration of civil administration in Australia-controlled territories in New Guinea. For a limited period, Australian-owned Papua and the mandated Territory of New Guinea, lying to the north of Papua, will have a common administration. The indenture system of recruiting native labor has been abolished, and improvements have been effected in the pay, hours, general conditions, and medical and educational facilities available to natives. Some concern was expressed regarding the desire of the United States to acquire a permanent naval base on Manus, an island of the Admiralty group of the Territory of New Guinea. Australians were resolved that acquisition of this base by the United States should not affect the Commonwealth's sovereign status over the island.

AUSTRIA. Since the defeat of Germany by the United Nations, a separate administrative territory within its 1922-37 frontiers under the joint occupation of forces of the United States, the United Kingdom, the Union of Soviet Socialist Republics, and the provisional government of the French Republic. The future status of Austria has not been officially decided as yet, although various authoritative statements indicate that Austria will be again established as an independent state.

Former Status.—The Austrian Republic (32,377 sq. mi.), as established in 1919 by the Treaty of St. Germain, comprised about 12 per cent of old Austria-Hungary. Of the Austrian half of the Dual Monarchy, 26.48 per cent of the territory was ceded to Poland, 26.21 per cent to Czechoslovakia, 9.34 per cent to Yugoslavia, 7.86 per cent to Italy, 3.48 per cent to Rumania, 26.63 per cent remaining to form the new Austria. By the Treaty of Trianon, Hungary was forced to cede most of the German speaking province of Burgenland to Austria (1,558 sq. mi.) Among the European states Austria ranked 19th in size, smaller than Portugal but larger than the Irish Free State. A land-locked state, it had a frontier 1,638 miles long which was divided over against Germany 487 miles, Switzerland 101 miles, Liechtenstein 23 miles, Italy 267 miles, Yugoslavia 193 miles, Hungary 226 miles, and Czechoslovakia 341 miles. It contained approximately 13 per cent of the population of former Austria-Hungary, or 24 per cent of the Austrian half. The German census of May 17, 1939, showed a population of 7,009,014; 3,400,328 males and 3,607,695 females. Its three largest cities are Vienna (1,918,462), Graz (210,175), Linz (131,423). Complete statistics of the 1939 census are not available and other figures cited are taken from the census of March 22, 1934, the last one undertaken by the republic. Austria had few minorities, the 1934 census showing that 6,584,547 spoke German as their mother tongue, 42,251 Czech, 3,615 Slovak, 31,703 Slovene, 42,354 Croatian, 18,076 Magyar and 23,317 some other language.

The Constitution of the Austrian Republic was set aside in 1933-34 when Chancellor Dollfuss ended the democratic regime in Austria and established his version of a dictatorship. A new constitution of May 1, 1934, established what was termed an Austrian Christian Corporative State. After the murder of Dollfuss in the *Putsch* by the Austrian Nazi Party on July 25, 1934, Chancellor Schuschnigg took over and continued the government along authoritarian lines. On Hitler's occupation of Austria, March 11-13, 1938, Austria officially became the *Ostmark*, one of the divisions (*Länder*) of the Greater German Reich. The nine Austrian provinces were rearranged into seven Reichsgaue. A greater Vienna that extended as far as Mödling and Klosterneuburg was set up expanding the number of districts (*Bezirke*) from 21 to 28.

Religion.—There were in Austria (1934) 6,116,481 Roman Catholics, 295,452 Lutherans and Calvinists (*Evangelisch*), 191,481 Jews, 36,776 Old Catholics, 7,105 belonging to other religious bodies, and 106,080 without a particular confession. The Roman Catholic Church had two archbishoprics and four bishoprics. Up to 1934 when the free functioning of political parties ceased it was represented by the Christian Socialist Party which won 36 per cent of the votes in the 1932 election. An Associated Press dispatch of Aug. 3, 1945, quoted Cardinal Innitzer as saying that "200,000 Catholics in his archdiocese had been excommunicated because they embraced Nazism." The Nazis had not dared to close the churches, but four priests were executed, more than 200 imprisoned and many others fined heavily for "speaking out for liberty." The anti-Semitic measures introduced by the Nazis have been repealed.

Government.—It was the Russian armies which began the liberation of Austria and occupied Vienna, April 6-13, 1945. On April 29, before the other Allied armies had entered very far into

Austria, the formation of a provisional government, under Dr. Karl Renner was announced over the Moscow radio. The Soviet Union at once accorded this government de facto recognition and has supported it ever since. The British and United States governments, however, pointedly declared that they had not been consulted as to the organization and formation of this government and could not give it any recognition. (Renner subsequently declared that he had formed his government independently and had then taken steps to notify Moscow, London and Washington. Vienna, being under Russian control and censorship, his communication only reached Moscow.) On May 14 the provisional government declared Austria an independent sovereign state. By governmental decree all laws dating from the Hitlerian period were abolished, the Nazi Party dissolved, the party's property confiscated and the death penalty along with property confiscation instituted for Austrians who were still party members. All persons who were members

tember 24-26. This co-opted body of provincial leaders, after having added a ministry for the Administration of State Property and an Undersecretary of Foreign Affairs to the Cabinet, endorsed the Renner government as the provisional regime for all Austria. They recommended that elections should be held before Christmas. Control of these elections was taken out of the hands of the Communist Minister of Interior Franz Khonner and given to a committee of five, which was to administer them within the Department of Interior. The committee is to be made up of two representatives from the People's Party, two Socialists, and one Communist and is to be under the chairmanship of Dr. Joseph Sommer of Upper Austria, a member of the Peoples Party. The provincial leaders also recommended that a provincial conference be called every two weeks to act as a sort of provisional parliament until the election was held. The conference in addition submitted various resolutions to the Allied Council, the organization of which is described below.

COMPOSITION OF THE AUSTRIAN PROVISIONAL GOVERNMENT

Chancellor and Minister of Foreign Affairs	Dr. Karl Renner	Socialist
Undersecretary of Foreign Affairs	Dr. Karl Gruber	People's Party
Member of the Council	Dr. Rudolph Schere	Socialist
Member of the Council	Leopold Kunshak	People's Party
Member of the Council	Johann Koplenik	Communist
National Defense	Lt. Col. Franz Winterer	Communist (?)
Interior	Franz Khonner	Communist
Justice	Dr. Joseph Göre	Non-party
Finance	Dr. George Zimmerman	Non-party
Agriculture	Rudolph Buchinger	People's Party
Industry, Trade, and Transport	Edward Heini	People's Party
Public Instruction and Religion	Ernst Fischer	Communist
Food Supplies	Andreas Horst	Socialist
Public Welfare	Johann Böhm	Socialist
Building and Reconstruction	Rudolph Raab	People's Party
Administration of State Property	Vincent Schumy	People's Party

of the Nazi Party between July 1933 and April 25, 1945, were called upon to register. At the Berlin Conference (July 17-August 2) the United States, Britain and Russia agreed that they would be prepared to examine the question of extending the authority of the provisional government to all Austria after the entry of the British and American forces into the city of Vienna.

Before the joint occupation of Vienna took place (August 23) the provisional government issued decrees for all Vienna and all Austria as well, publishing them in the *Staatsgesetzblatt für die Republik Oesterreich*. After they had arrived in Vienna the British posted specific notices that some of these decrees would take effect in their zone as if enacted by the military governor, but definitely excepted others. The United States and France treated the Renner decrees in similar fashion. Thus, not even in joint-ruled Vienna, let alone all Austria, was there anything like a common policy.

The Austrian provisional government in the fall of 1945 was headed by Dr. Renner, a 75-year-old left wing Social Democrat who had helped to organize the Austrian Republic after the First World War. He was assisted at the helm by a three man council representing each of the three co-operating political parties. These council members were ministers without portfolio and as such were members of the Cabinet. During the Austrian Republic no Communist ever won a seat in the representative body, but in the fall of 1945 they held three, if not four, governmental posts in the provisional government. The old Catholic parties were unrepresented. In order to meet the charge that his government centered too much in Vienna and did not represent all Austria, Renner called a meeting of representatives of the provinces to meet in Vienna, Sep-

Some local governing bodies are functioning in the different parts of Austria but it is not clear how these are organized or how much authority they possess. The former nine provinces of Austria and the old 21 districts have been re-established.

The Allied Control Machinery in Austria as announced by the European Advisory Commission on Aug. 8, 1945, is as follows. Austria, within its 1937 frontiers, is partitioned into four allied zones of occupation. These are shown on the accompanying map. The Russian zone consists of the provinces of Lower Austria exclusive of Vienna, that part of Upper Austria on the left bank of the Danube and Burgenland; the American zone, that part of Upper Austria on the right bank of the Danube and Salzburg; the French zone, Tyrol exclusive of East Tyrol and Vorarlberg; the British zone, Styria, Carinthia and East Tyrol. Each of these four zones is under the full authority of the commander in chief of the respective forces of occupation. For the Russian zone this is Marshal Ivan S. Konev; American, Gen. Mark W. Clark; French, Gen. Marie-Emile Béthouart; British, Lieut. Gen. Sir Richard McCreery. These four commanders in chief who are to have their main headquarters in Vienna are to constitute themselves as an Allied Council. This Allied Council, along with an executive committee and staffs appointed by the four governments concerned, is to be known as the Allied Commission for Austria. Its primary tasks are "(1) to achieve the separation of Austria and Germany; (2) to secure the establishment as soon as possible of a central Austrian administrative machine; (3) to prepare the way for the establishment of a freely elected Austrian government; and (4) meanwhile, to provide for the administration of Austria to be carried on satisfactorily." The decisions of the

Allied Council which was formally established on September 11 are to be unanimous. "As soon as departments of a central Austrian administration are in a position to operate satisfactorily, they will be directed to assume their respective functions as regards Austria as a whole, and will fulfill them under the control of the Allied Commission."

The city of Vienna within its 1937 boundaries (107 sq. mi.) is divided into four zones of occupation and is to be administered by an "inter-Allied governing authority consisting of four commandants appointed by their respective commanders in chief." There are to be numerous technical staffs and the whole governmental machinery for Vienna is to be under the general direction of the Allied Council. Vienna is partitioned as follows: District I (Innere Stadt), occupied by four powers jointly; district II, IV, X, XX, XI (Leopoldstadt, Wieden, Favoriten, Brigittenau, Floridsdorf), occupied by the Soviet Union; districts III, V, XI, XII, part of XIII (Landstrasse, Margareten, Simmering, Meidling, Hietzing), occupied by the United Kingdom; districts VI, part of XIII, XIV, XV, XVI (Mariahilf, Penzing, Rudolfsheim, Fünfhaus, Ottakring), occupied by France; VII, VIII, IX, XVII, XVIII, XIX (Neubau, Josefstadt, Alsergrund, Hernals, Währing, Döbling), occupied by the United States. This division shows that there has been some gerrymandering of districts. The Russians were particularly anxious to obtain the working class districts and also to command the communication lines to the east and south. By the end of September 1945 the Allied government of Vienna had not as yet been fully organized and different regulations were being enforced in the four zones of occupation. The Renner provisional government had named General Körner as Bürgermeister of Vienna and Johann Steinhard as Vizebürgermeister.

Principal Events, Oct. 1, 1944-Oct. 1, 1945.—At the Moscow Conference (Oct. 19-30, 1943) the foreign secretaries of the United States, Great Britain and the Soviet Union issued a formal declaration expressing their "wish to see re-established a free and independent Austria." At the same time Austria was warned that "in the final settlement, account will inevitably be taken of her own contribution to her liberation." This warning was repeated various times during the fall and winter of 1944-45 in official Russian, British, and American releases. An Austrian underground group in Styria and Carinthia apparently struck up relations with Tito's partisans. On the whole the activity of Austrian underground forces was not of great significance and is not to be compared in importance with the liberation movements in Greece, Yugoslavia, Poland, Bohemia, or Italy.

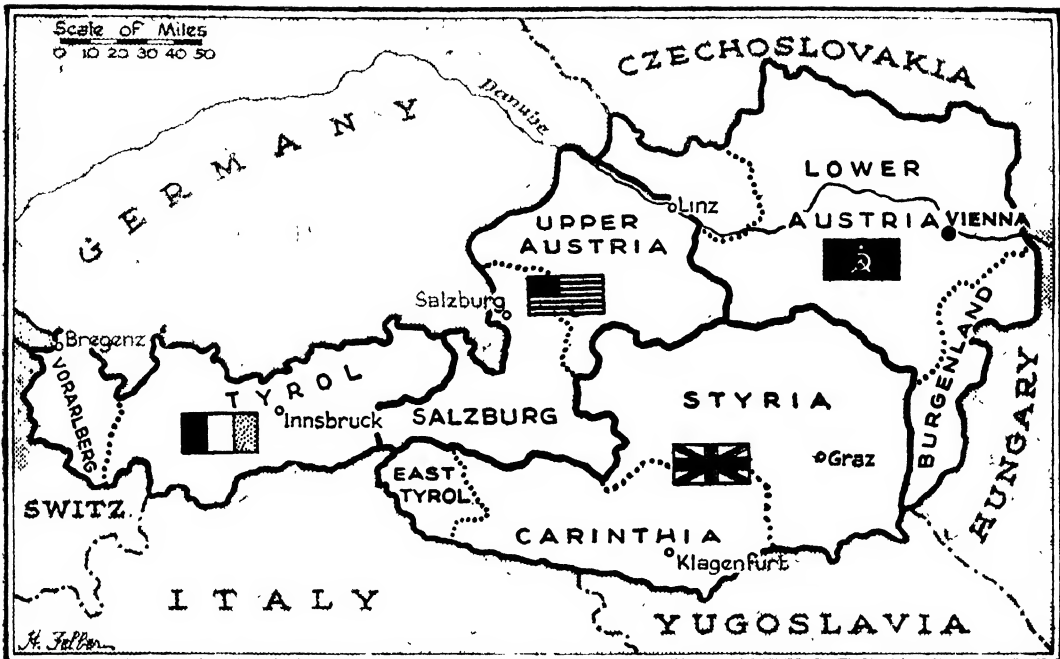

Russian troops crossed Austria's eastern frontier on March 30. Vienna had been placed under complete control of German S.S. troops and withstood a seven-day siege, capitulating to the Russians on April 13, 1945. It was the fourth time in its two thousand-year history that Vienna had been taken by force, by the Ostrogoths in the 5th century and twice by armies of Napoleon. Long sieges by the Turks in 1529 and 1683 and two sieges by Bohemians and Swedes during the Thirty Years' War had been withstood. On April 26-27 American troops crossed from Bavaria into Austria. The German commanders in Italy signed terms of unconditional surrender on April 29 and when these went into effect at noon on May 2, the American and British armies in Italy were re-

ported to be within 30 miles of the Austrian border. The military agreements between the American, British and Russian armies have not been revealed, but it is clear that at least preliminary zones for military occupation had been previously agreed upon. As the British armies proceeded to occupy their sections which included Styria and Carinthia, they found that Marshal Tito had occupied part of these provinces with Yugoslav partisans. Tito centered his attention on Klagenfurt, the capital of Carinthia. While there are some Slovenes in this area, the inhabitants had decided in a well-run plebiscite in 1920 to remain with Austria. Their present attitude is questionable, but Tito claimed they longed to join Yugoslavia. In any case, final decision would have to await the conclusion of the peace treaty, although effective occupation might well prove to be nine points of the law. Tito's claim to Austrian territories was closely bound up with his claim to occupy Trieste and the rest of Venezia Giulia. In a note on April 2, Tito had proposed to Russia, Britain and the United States that Yugoslav troops occupy a part of Austria. Russia had agreed to the proposal, but at this time no answer had been forthcoming from the other two Allies. The United States and Britain now protested to Tito on his occupation of Klagenfurt and Trieste. These notes, coupled with some very firm action by Field Marshal Sir Harold R. L. G. Alexander, the Allied Supreme Commander in the Mediterranean, led Tito to agree to the withdrawal of his troops from Austria (May 20). A compromise was worked out in regard to the occupation of Italian territory.

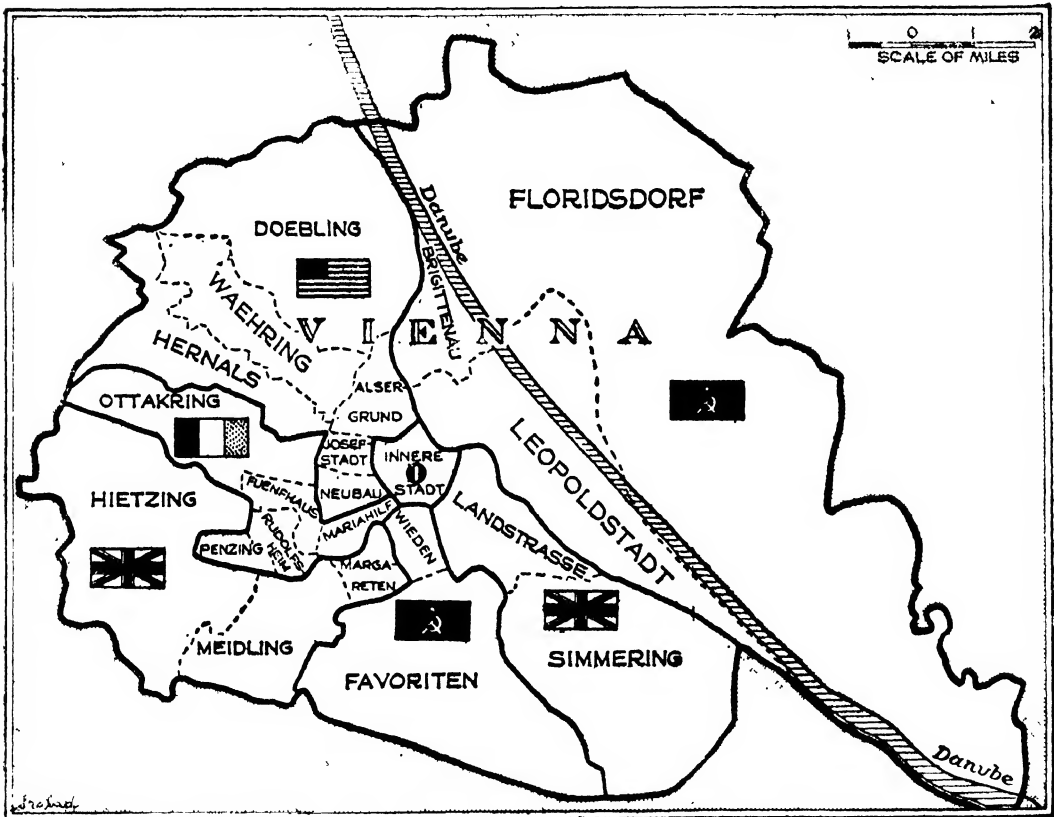

The European Advisory Commission, established in London in 1943, had the authority of the Allies to deal with the Austrian problem. During the fall and winter of 1944-45 the press carried various reports as to what Allied policy for the occupation of Austria was to be. It seems that at first the commission favored a blended Allied police force for the joint occupation of Austria. This gave way to the division of Austria and even of Vienna into three zones of occupation. On May 24 the press carried the report that there were to be four occupation zones and a four-power Allied control commission for Austria. This meant that France, no doubt as a result of decisions reached at the Yalta Conference (Feb. 3-11, 1945) was to share in the occupation. During the first days of July the French took over the occupation of Tyrol and Vorarlberg from the Americans. The Russians apparently delayed the British entry into Styria until the end of that month. Meanwhile anything like a common policy for Austria could not be worked out until the joint occupation of Vienna had been arranged. In spite of repeated press statements during June and July that the entrance of American, British and French forces into Vienna was at hand, their entry was always delayed. An American billeting party which had reached Vienna early in July was asked to leave. Finally on August 8 two statements summarizing the agreements reached by the European Advisory Commission on the control machinery and zones of occupation in Austria were released in Washington, London and Moscow. These agreements have been summarized above in the section on government.

It was not until August 23 that the commanders in chief of the American, British and French forces that were to occupy the different zones in Vienna formally entered the city. One reason given for the delay was the illness of the Russian commander in chief, Marshal Ivan S. Konev. An-

AUSTRIA

The four zones of occupation in Austria are designated by the flags of the United States, Great Britain, the Soviet Union, and France.

Courtesy The New York Times
Vienna was also divided into four zones as designated by the flags, with the Innere Stadt (1) under the joint control of the four powers.

other underlying cause was the failure to reach an agreement on how food was to be supplied for the starving Viennese. They had been subsisting for the past five months on a diet of less than 900 calories daily. Obviously these rations should be increased. Both French and Russian forces in their respective occupation zones were following a policy of living off the land. In addition, Russia was occupying the most productive sections of Austria and particularly those areas which had formerly supplied Vienna with most of its vegetables and other foodstuffs. For Britain and the United States to undertake to send in all the food supplies necessary would resemble the problem of filling a food basket with several large holes in the corners. More food was due Vienna from the regions from which its food supplies had always been drawn. It was finally agreed that temporarily at least each occupying army was to supply an amount of food in proportion to the population of the zone of the city occupied by it. The food was to be put in a pool and distribution was to be controlled by the Russians under the supervision of the other powers. Fortunately the problem of furnishing relief to the ill-fed and ill-clad peoples of Vienna was eased when UNRRA on August 21 voted to extend its aid to Austria as well as to Italy. The food problem, however, delayed the formation of the formal Allied Council until September 11. Soon thereafter it was announced that the Soviet Union had agreed to import from outside sources the food needed for its army of occupation.

The population of Austria suffered severely from the ravages of war during the last months of the conflict. In January 1945 the Vatican issued a public appeal that Vienna be spared and be declared an open city. Neither side took up this suggestion. In Vienna, famed St. Stephen's Cathedral was gutted as was the opera house. Extensive damage was done in the old Inner City and in some of the factory districts. The wholesale policy of requisitioning practiced by the Russian forces and the quartering of excessively large Russian forces in Austria caused great hardship. Typhus was reported as being widespread, along with extensive malnutrition. The Soviet Union requisitioned, as reparations owed by Germany,

The opening of theaters and the performance of various concerts have been pushed in Vienna. On August 12 the famed Salzburg music festival was revived. Before the joint occupation of Vienna many of the schools were reopened under the direction of the new Communist minister of education and religion. School prayers are banned and all schools are to be under the direction of the government. Religious instruction is to be optional and in secondary schools Marxian as well as Christian philosophy is to be a subject of instruction.

So far the different Austrian exile movements in England or the United States have not had a direct hand in Austrian affairs. The "Free Austrian Movement" in England initially announced its support of the Renner government. The strongly Catholic and pro-monarchist monthly paper *Austria* published by Octave O. Günther in New York has denounced the bolshevism of the provisional government. This paper is, of course, a strong advocate of Austrian independence and the partitioning of Germany. The wisdom of Allied policy in dividing Austria and Vienna into four zones of occupation is questioned by Austrian exiles of every political persuasion.

E. C. HELMREICH,
*Associate Professor of History and Government,
Bowdoin College.*

AUTOMOBILE REGISTRATION. See HIGHWAYS.

AUTOMOBILES. According to an estimate of the Automobile Manufacturers Association, 503,520 cars were scrapped in automobile graveyards in 1944. The year 1941 had been the greatest in the history of American motor vehicle production from the standpoint of value, but two years later the number of passenger cars produced dropped to zero, while virtually all motor truck production was for the army. The total number of motor vehicles manufactured in 1943 was less than in any year since 1914, and the wholesale value of this diminished production was less than in any year since 1933. The following table indicates some of the effects of the war on the automobile industry:

FACTORY SALES AND WHOLESALE VALUE, U. S. PLANTS

	Passenger cars		Motor trucks		Total	
	Number	Value	Number ^a	Value ^a	Number	Value
1940	3,692,328	\$2,422,491,461 ¹	777,026	\$ 593,731,603 ¹	4,469,354	\$3,016,223,064
1941	3,744,300	2,615,697,373 ¹	1,094,261	1,086,925,650 ¹	4,838,561	3,702,623,023
1942	220,814	173,661,378 ¹	805,264	1,366,000,000 ¹	1,026,078	1,539,661,378
1943	0	0	677,115	1,340,000,000 ¹	677,115	1,340,000,000
1944	0	0	749,488	1,500,000,000 ¹	749,488	1,500,000,000

the equipment of many factories. The Renner government is reported to have refused to grant Russia half the shares in a new Austro-Russian consortium which is to take over the important oilfield at Zistersdorf. American, British and Dutch capital was invested in this field before the war. The Nazis apparently expanded its production until it equaled one fourth the total production of the Rumanian oilfields. In an attempt to get Austrian industry functioning again, the American military command arranged a barter agreement with Czechoslovakia to start on September 1, under which 350,000 tons of Austrian ore was to be exchanged for 100,000 tons of Czech coke.

NOTE: Above table includes military trucks as follows: 1940—55,389; 1941—218,880; 1942—672,181²; 1943—672,614; 1944—624,669.

¹ Includes federal excise taxes and standard equipment.

² A substantial part of the trucks reported comprises

Reliable estimates for the 1945 motor vehicle production will not be available until the first quarter of 1946.

On Oct. 29, 1945, Chester Bowles, price administrator, and J. A. Krug, War Production Board chairman, revoked Ration Order 2-B, which permitted the sale of cars produced after July 1, 1945, only with certificates. In effect this meant that thenceforth there was to be no further automobile rationing. However, as the Office of Price Administration had not up to that time set prices for cars, and no sales could be made until such prices were authorized, manufacturers received the news with mixed feelings. The government officials stated

chassis only, without body; hence the value of bodies for these chassis is not included. Buses, station wagons, fire apparatus, street sweepers and other special purpose vehicles are included. 1942, 1943 and 1944 values are estimates.

³ Includes 548 military integral type buses.

as reasons for an unexpectedly early end of rationing:

"With almost 24,000,000 cars on the road, and with new automobile production started, there is no longer danger of a general breakdown of the automotive transportation system. As new car production picks up, newer and better used cars will also become increasingly available."

dar year 1944, compiled from reports of state authorities; (2) in May, a table giving 1944 state motor vehicle receipts, comprising registration fees and miscellaneous receipts; (3) in June, a table listing and analyzing 1944 state motor fuel tax receipts; and (4) also in June, a table listing the proceeds of state imposts on motor vehicles operated for hire. The totals of these various tables are shown below:

* Including private, commercial and publicly owned motor vehicles.

† Including registration fees and miscellaneous receipts.

‡ Adjusted net total receipts.

§ Proceeds of state imposts on motor vehicles operated for hire and other motor carriers.

¹ Registration fees include proceeds of state "vehicle license fees," \$14,238,000, imposed in addition to the

regular registration fees of \$13,497,000.

² Special county taxes of 3 cents per gallon in Hancock County and 2 cents per gallon in Harrison and Jackson counties, amounting to \$267,000 in 1944, are imposed for seawall protection and are not included in this table.

³ No special taxes on motor carriers reported.

⁴ Ton-mile and passenger-mile taxes paid by motor carriers in lieu of registration fees.

⁵ Weighted average rate.

The Public Roads Administration of the Federal Works Agency issued during 1945 several compilations: (1) in April, a table covering state motor vehicle registrations for the calen-

Exports.—Details of the automotive export trade for the years 1940, 1941, 1942, 1943, and 1944 are shown in the table on the opposite page:

VALUE OF EXPORTS FROM UNITED STATES
(Source: Motive Products Division, U.S. Department of Commerce)

	Cars and trucks ¹	Parts and accessories ²	Rubber tires and tubes	Total value of exports ³
1939	160,594,315	109,321,470	21,883,803	291,799,588
1940	155,090,880	117,173,166	27,520,815	299,784,861
1941	223,178,698	133,015,153	31,472,904	164,488,057
1942 ^a	271,456,148	155,474,021	45,009,153	200,483,174
1943 ^a	148,262,721	129,452,852	90,068,389	367,783,962

¹ Includes shipment to noncontiguous territories.

² Includes value of "parts for assembly" and shipments to noncontiguous territories.

³ Excludes shipments to noncontiguous territories, Alaska, Hawaii, Puerto Rico.

AWARDS. See PRIZES AND AWARDS.

AZERBAIDZHAN SOVIET SOCIALIST REPUBLIC. See UNION OF SOVIET SOCIALIST REPUBLICS.

AZORES, à-zôrz', or ACORES, à-sô'râsh, ISLANDS. An archipelago of nine volcanic islands and a number of islets in mid-Atlantic, politically part of Portugal; area, 922 square miles; population (1940), 284,755. The islands lie between 36° 55' N. and 39° 55' N. latitude and between 25° 10' W. and 31° 16' W. longitude, along a 375-mile line running approximately northwest-southeast, at an average distance of about 900 miles west of Portugal.

The inhabitants are largely Portuguese in origin, with a marked strain of Moorish and Flemish blood. English, Scottish, Irish, Negro, and mulatto immigrants are numerous, especially on São Miguel and Fayal. Portuguese is the official language, and Roman Catholicism is the dominant religion.

The islands, consisting of three groups, comprise three political districts of Portugal, each of which sends representatives to the Chamber at Lisbon. The southeast group is composed of Santa Maria (Saint Mary) and São Miguel (Saint Michael). The center group, about 100 miles northwest of São Miguel, consists of Terceira, São Jorge (Saint George), Pico, Graciosa, and Fayal (Faial). Flores and Corvo, 140 miles northwest of Fayal, form the third group. The capitals of the three districts are the chief seaports: Ponta Delgada (population about 18,000) on São Miguel Island; Horta (about 7,000) on Fayal; and Angra do Heroísmo (about 11,000) on Terceira.

Production.—Being of volcanic origin, the islands are subject to eruptions and violent earthquakes. Hot mineral springs are numerous, the baths at Furnas in São Miguel providing a resort for invalid tourists. The climate is temperate and the soil productive, and an industrious farming peasantry comprises the bulk of the population. Crops include cereals, vegetables, wheat, potatoes, corn, beans, fruit, meat, milk, butter, cheese, and eggs. The natives make wine from their own grapes and sugar from beets. Oranges and pineapples are grown, the latter being carefully raised in hothouses and brought to maturity by a

"smoking" process locally developed. Tobacco, tea, and hemp are also raised. Linen is made from home-grown flax, and woolen garments are manufactured from sheep's wool. Other leading manufactures are embroideries, flour, alcohol, canned fish, and chicory. The most important fish yields are tuna, bonito, and mullet. Nearly all manufacturing enterprises are located on São Miguel, which is also the archipelago's largest, richest, and busiest commercial unit; it comprises nearly a third of the area of the islands and accounts for half their population.

Foreign Trade.—The Azores are for administrative purposes a part of Portugal, and official trade statistics are not published by the Portuguese government.

Domestic exports from the United States to the Azores had a total value in 1942 of \$647,000; in 1943 they dropped to \$249,000; and in 1944 rose to \$584,000. General imports from the Azores into the United States during the three years indicated were valued at \$179,000; \$198,000; and \$314,000 respectively. Exports from the United States to the Azores consisted principally of vegetable food products and beverages; inedible vegetable products, including tobacco; textile fibers and manufactures; coal; tinplate; and chemical specialties. The principal imports from the Azores included tuna fish in oil; cotton manufactures; flax, hemp and ramie manufactures; and ambergris.

Communications.—For many years one of the most important communications centers in the world, the Azores today, in addition to radio stations, is reached by no less than 15 cables. The islands also are important steppingstones in transatlantic aviation, and, as stated by the National Geographic Society, have been a way station for transoceanic fliers since 1919 when the navy plane NC-4 landed there from Newfoundland on the first transatlantic flight. In 1939 the *Yankee Clipper* made the Azores a port of call on its regular over-ocean flights. In 1945 a new airfield, reported to have cost \$12,000,000, was completed and opened on Santa Maria, southernmost of the Azores. It was built by an American contractor, but up to August 1 very few details concerning it had been released to the public. Santa Maria is 2,550 miles east of New York City, approximately 1,600 miles from London, and about 865 miles west of Lisbon, Portugal.

B

BACTERIOLOGY. Individual spectacular advancements have not been made during the past year in the field of bacteriology. However, the subject has shown healthy growths along many lines. These cannot all be reviewed in the space

allotted; hence, the following phases, which have shown steady consistent growth during the past few years, will be considered: (1) The study of antibiotics; (2) the use of isotopes in studying microbiological metabolism; (3) the growth of

micro-organisms in chick embryos; (4) the chemical composition of bacteria; and (5) miscellaneous advancements.

Antibiotics.—The search for new and the more careful study of known antibiotics has continued. Almost every group of organisms known produce antibiotics. *Lysozymes* have been obtained from egg white, egg yolk, milk, saliva, and tears. Osborn¹ tested approximately 2,300 plants belonging to 166 families against *Staphylococcus aureus* and *Escherichia coli* and found 63 genera containing substances which inhibited the growth of one or both test organisms. Extracts made from plants belonging to the same family yielded a substance having similar specificity and potency. Inhibiting substances were in some cases distributed throughout the plant, in others restricted to specific parts of the plant. Drying of some plants caused a loss of inhibiting powers, in others there were no losses. Certain well-known drug plants showed no inhibiting powers. Burkholder and Evans² tested approximately 100 different lichens for antibiotic activity against bacteria; 52 were found to inhibit either *Bacillus subtilis* or *Staphylococcus aureus* or both. Although Gram-positive organisms including several pathogenic types are inhibited, Gram-negative bacteria, with few exceptions, are generally not susceptible to the antibiotic substances of lichens. Today a careful survey of all known substances leads to the conclusion that of all organisms known which produce antibiotics the ones which are significant from a pharmaceutical standpoint are the actinomyces, bacteria, and molds.

Great advancements have been made during the past five years in the production of penicillin. The British workers in 1940 obtained one to two Oxford units per ml. of medium with surface cultures. However, select media soon made it possible to produce 20 units and today, due to extensive work by the Fermentation Division of the Northern Regional Research Laboratories of the U.S. Department of Agriculture, together with that of various pharmaceutical concerns, it is possible to produce 150 units in one ml. of media.

The importance of this advancement is recognized when it is known that the amount of penicillin required per case ranges from 100,000 units to a few million and it is estimated that one billion units of pure penicillin weighs approximately one pound.

The yield depends upon (1) the organism. Some organisms are more active producers of penicillin than are others. Roper et al³ studied 241 different cultures belonging to the *Penicillium notatum-chrysogenum* group and found all but 24 of the strains produced measurable amounts of penicillin. No strain studied produced more penicillin than the one developed by Squibbs. Approximately 25 per cent of the strains studied produce penicillin equal to or in excess of the original Fleming strain. They concluded from their work; (a) penicillin production is characteristic of the entire *P. notatum-chrysogenum* group, (b) strains vary greatly in their capacity to produce penicillin, (c) good penicillin production is generally limited to strains belonging to one of two species, *P. notatum* Westing and *P. chrysogenum* Thom, and (d) better producing strains are most satisfactorily assigned to the species *P. notatum* Westing.

Some *Aspergillus* produce antibiotic substances in concentrations equal to or in excess of the penicillin.⁴ *Aspergillus fumigatus* produces an antibiotic which is bacteriostatic against the BCG organism in dilution of 1:1,400,000, thus raising

the hope that antibiotics will be found which are effective against *Mycobacterium tuberculosis*. (2) The quantity of antibiotic produced varies with the medium in which the organism is grown. They require accessory food substance and are all aerobic. (3) The condition under which the organisms are grown. The earliest method was the growing of the organism in bottles, flasks, and trays. This was followed by the trickle process in which the inoculated broth was allowed to flow over stones or wood shavings under aerobic sterile conditions similar to the quick vinegar method. Then came the growing of cultures in large tanks. At the end of fermentation the Mycillium is filtered, discarded, and the penicillin recovered from the broth.

Advancement in the field of antibiotics is dependent upon quantitative methods for their determination. The penicillin unit was first defined as the amount of penicillin in 50 ml. of broth required to inhibit *Staphylococcus aureus*. After the Oxford workers devised the cylinder plate test, the standard unit was redefined as the amount of penicillin which produces an inhibited zone 24 mm in diameter. This may vary greatly with the technique, hence the Oxford workers prepared a selected batch of partly purified penicillin, which was checked against the above defined unit and used as a standard. At first it was known as the Florey unit and later at Florey's request designated the "Oxford unit." This unit has become widely used in penicillin assay. The present international unit arrived at by collaborative assays of a single batch of penicillin by many commercial and governmental laboratories in this country and Great Britain, is essentially equal to the original Oxford unit, and is based on the crystalline sodium salt of penicillin with a value of 1.667 units per milligram.

Abraham and Chair⁵ discovered in 1940 that some bacteria produce an enzyme, penicillinase, which destroys penicillin. It is produced by a wide variety of bacteria, yeasts, and molds. Some aerobic spore-forming bacteria and certain actinomyces are outstanding in this respect.⁶ Although there is not a perfect correlation between penicillin resistance and penicillinase production of micro-organisms, yet it is believed that some penicillin resistant micro-organisms, *Mycobacterium tuberculosis* for example, owe their resistance to their ability to produce penicillinase. Although this is not the only factor determining penicillin resistance, yet the importance of it is great, for (1) if contaminants producing penicillinase enter cultures, the yield of penicillin is greatly reduced, (2) if infections are due to micro-organisms which produce penicillinase, they may not yield to penicillin treatment, (3) mixed infections, containing penicillinase-producing organisms, may not yield to penicillin treatment, and (4) the presence of penicillinase in penicillin indicated contamination.

McQuirrie and Lubmann⁸ showed that the ability of a micro-organism to produce penicillinase varies with the medium in which it is grown. The enzyme is very sensitive to changes of pH, the presence of iodoacetic acid and amylacetate, and to a lesser extent, Indole-3 acetic acid. A fairly purified, dried, sterile penicillinase has been prepared, which is valuable in the testing of penicillin sterility.⁹

Cultivation of Organisms in Chick Embryos.—The advancements in bacteriology are measured by the ability to culture and study under aseptic conditions in the laboratory micro-organisms and viruses. A great advancement in this field was

made when it was learned that many obligate and near-obligate parasites may be grown in the chick embryo. The chick is usually immune to human infections, whereas the chick embryo is susceptible. Hence the chick embryo is almost a perfect medium to (1) study the diseases produced by pathogens and apply to them Koch's postulates, (2) study the morphology and physiology of pathogens, (3) study the specific lesions produced by obligate parasites. Many obligate parasites grow in the chick embryo and produce lesions similar to or identical with those produced in their natural host, (4) produce large quantities of micro-organisms or viruses for the manufacture of vaccines and study immunity and antibody production under laboratory conditions and (5) the chick embryo method, coupled with chicken red cell agglutination and inhibition of agglutination methods, offers a quick simple means of isolating and typing of influenza viruses.^{10,11}

The chick embryo lends itself especially to the growth of typhoid, diphtheria, scarlet fever, gonorrhea, epidemic meningitis, whooping cough, and some 35 obligate parasitic viruses. It is cheap, readily available, uniform in composition, self-nourishing, and free from infection. Moreover, the multiplication of the organism can be watched and controlled.

A window is cut in the shell leaving the membrane intact to serve as a hinge where desired, to close the flap. The window is cut with a sharp knife or preferably a dentist's drill. The organism to be studied is inoculated into the chorio-allantoic membrane. A glass cover may be sealed into place with sterile vaseline and the egg incubated for the required time, usually from two to four days. This has been very successful in the production of vaccines for typhus fever, Rocky Mountain spotted fever, small pox, and many others.

Various methods have been used for the preparation of vaccine viruses, but unsatisfactory results are usually obtained with killed viruses. This failure has been interpreted as due to (1) immunity enduring only so long as viruses are present in the tissues. Killed viruses are soon removed, hence immunity is of short duration, (2) viruses as produced in the past have not been concentrated enough to produce effective vaccines.

The work of Stanley¹² apparently overcomes the latter difficulty. He grew the influenza virus in the chick embryo and concentrated it by centrifugation. This vaccine possesses 20 or more times the immunizing potency of the usual commercial vaccine. After carefully checking the physical and chemical factors involved in the concentration, he concluded that very effective vaccines may be produced in this manner.

The Use of Tagged Molecules in Studying Animal Metabolism.—During recent years, the use of tagged molecules has clarified many obscure points in animal metabolism.¹³ This is done by introducing into the product to be studied, either heavy isotopes or radio-active isotopes and determining the occurrence of these tagged molecules in the tissues or products produced or occurring in the living organism. This method has been carried over to a study of bacterial metabolism and gives promise of clarifying some complexities which could not be unraveled by previous methods. Werkman and associates are pioneers in this field.¹⁴ They showed that *A. indologenes* in the presence of glucose condenses acetic acid containing C¹³, the isotopic heavy carbon, to succinic acid. The C to C-linkage created in the condensation involves the C atom originally pres-

ent in the methyl group of acetic acid. The results are believed to offer the most direct evidence for participation of acetyl-aldehyde as an intermediate in the formation of 2,3 butylene glycol. Later CH₃C¹³H₂CH₂C¹³OOH was isolated from butyl alcohol fermentation of corn mash to which CH₃C¹³OOH was added. The distribution of the C¹³ in the molecule supports the suggestion that butyl alcohol is formed by a condensation of acetic acid or its derivative.¹⁵ The fixation of CO₂ in the carboxyl group of lactic acid has been shown by means of C¹³O₂ to be a major reaction in the fermentation of glucose by *Cl. butylicum* in the presence of bicarbonate.¹⁶

The mechanism of the butyl alcohol fermentation by *Cl. acetobutylicum* and *Cl. butylicum* was investigated with the following labeled compounds: CH₃C¹³OOH, CH₃·C¹³H₂·CH₂·C¹³OOH, and CH₃·C¹³O·CH₃. The labeled compounds were added to corn mash fermentations; the products of fermentation were isolated and their C¹³ content determined. The position of the labeled C¹³ within the carbon chain was determined in the butyl alcohol, acetone, and isopropyl alcohol.

Results with CH₃·C¹³OOH

1. The C¹³ was recovered in butyl alcohol, acetone, isopropyl alcohol, butyric acid, acetic acid, ethyl alcohol, and CO₂.

2. The butyl alcohol contained approximately 50 per cent of the added C¹³. It is therefore obvious that added acetic acid is not converted quantitatively to acetone or isopropyl alcohol, as has been previously reported.

3. The labeled carbon in the butyl alcohol was in the carbinol and β-positions, and the concentration of C¹³ is approximately the same in these two positions. It was suggested that the molecule is synthesized from acetic acid or a derivative. There was no evidence of the preferential union of acetate with an intermediate compound from starch.

4. The acetone or isopropyl alcohol accounted for 15 to 19 per cent of the added C¹³. The labeled carbon was exclusively in the carbinol and carbinol groups respectively.

5. The C¹³ recovery in the CO₂ was approximately the same in the acetone and isopropyl alcohol. This fact, together with established position of the C¹³ in the acetone and isopropyl alcohol, is in agreement with the suggestion that acetone is formed from acetate.

6. It is suggested that the butyric acid, butyl alcohol, and acetone may have a common precursor which is formed from acetate or a derivative of acetate.

Results with CH₃·C¹³H₂·CH₂·C¹³OOH

1. The C¹³ was recovered in butyl, ethyl, and isopropyl alcohols, and acetic and butyric acids.

2. Approximately 85 per cent of the added C¹³ was present in the butyl alcohol. The labeled carbon was in the carbinol and β-positions. It is suggested that butyric acid is a precursor of butyl alcohol.

3. The conversion of butyric acid to acetic acid, acetone and isopropyl alcohol may be a reversible series of reactions through aceto-acetic acid. The location of the labeled carbon in the acetone and isopropyl alcohol is in agreement with this proposal.

Results with CH₃·C¹³O·CH₃

1. The C¹³ was recovered in isopropyl alcohol. The presence of labeled carbon in other products could not be reliably detected.

2. Evidence is presented which indicates that acetone is an intermediate in the formation of isopropyl alcohol.¹⁷

When pyruvic acid is desimilated by *E. coli* extract in the presence of HC^{14}OOH the residual pyruvate contains excess C^{14} in the carboxyl group, which is evidence for reversibility of the pyruvate split.

When pyruvic acid is broken down in the presence of $\text{CH}_3\text{C}^{14}\text{OOH}$ and of adenylyl-pyrophosphate, the residual pyruvate contains excess of C^{14} in the carbonyl group.¹⁸

A question which has plagued the bacteriologists for centuries is, what organisms can fix atmospheric nitrogen? This question came to the fore when it was found that *Rhizobium* and *Azotobacter* both possessed the ability to fix nitrogen when grown under appropriate conditions. Since these discoveries, claims have been made that numerous micro-organisms possess this ability. The use of isotopic N^{15} has made it possible to specifically answer this question, and it is done by culturing the organisms in free nitrogen and then testing for combined N^{15} . This demonstrated that a number of species of *Azotobacter*, *Clostridium pasteurinum* and blue-green algae, *Nostoc muscorum* fix appreciable quantities of nitrogen.¹⁹ Greaves and Greaves²⁰ demonstrated in 1932 that some actinomycetes possess the ability of fixing free nitrogen when living in the soil. Now, Plöth²¹ has substantiated these findings and also isolated an actinomycete from the alder and reproduced the alder root tubercles by its addition to plants that had been germinated aseptically.²² Frei²³ reports nitrogen fixation by several film-forming yeasts and one mold. Moreover, the use of N^{15} in the study of nitrogen fixation substantiates the theory that the first product in nitrogen fixation is ammonia.²⁴

Composition of Bacteria.—The discovery that immunological properties and chemical composition are related gave a great impetus to the study of their composition. Some thirty types of pneumococci possess different polysaccharides in their capsule. These are related to type specificity. Moreover, pathogenic bacteria vary in the colony produced. Smooth (S) colonies are different in composition from rough (R). Smooth may lose their capsule and become R and at the same time decrease in virulence. Avery²⁵ and co-workers isolated from the smooth type III pneumococci a substance, probably a polymerized deoxyribonucleic acid, which in small quantities transformed the R to the S type. Hence, it is possible to change a non-virulent R-type to a virulent S-type, possessing different immunological properties.

Analyses^{26, 27, 28} of influenza virus A and B and swine influenza virus show them to contain polysaccharides, proteins, and deoxyribonucleic acid and from 21 to 24 per cent lipid. The latter consist of neutral fats, phospholipids, and cholesterol.

The members of the vitamin B complex are absent from tobacco mosaic virus, which has been interpreted as indicating that they are inanimate.²⁹ However, this may be associated with their obligate parasitic nature, as they lack the needed enzymes for individual growth and metabolism.

An extensive study has been made of the composition of the gonococcus.³⁰ Two nucleoprotein fractions were obtained, one contained considerable combined lipid. Three different forms of carbohydrates occurred but no type specific carbohydrate was found. However, Boor and Miller³¹ obtained glucolipids which were moderately toxic for animals and antigenic for rabbits. A polysaccharide has been obtained from *Cl. perfringens* which is common to most members of this group.³²

Work continues on the composition of tuberculin. Glycogen has been isolated from this material. It has been claimed that hyaluronidase acid is associated with the virulence and spreading properties of hemolytic streptococci and pneumococci but recent work has failed to substantiate this.^{33, 35}

Miscellaneous.—A study³⁶ of *Bacterium tulare* shows it to be extremely polymorphic. It possesses neither capsules nor flagella and is non-motile. Its morphologic units include globi and globules, flat and cylindrical bacillary forms, coccoid forms and delicate filaments. All forms seem to possess multiple modes of reproduction with budding apparently the more general. Complex morphological nuclear changes have been shown to occur when some sporulating micro-organisms pass into the spore form.³⁷ Aerobic and anaerobic bacteria differ in that the former contain lipoprotein granules as reserve material whereas anaerobic bacteria do not.³⁸ The irregular staining of *malleomyces mallei* (Glanders organism) is attributed to the presence of lipoidal granules within the protoplasm. These fail to stain with the aniline dyes, but do so with sudan black.³⁹

Evidence continues to accumulate that carriers and contact play a role in the spread of some cases of poliomyelitis.^{40, 41} Extensive studies have confirmed the earlier belief that the oral cavities of new born infants are sterile and that the flora is gained during the first few weeks after birth. However, there is small tendency for some pathogens to gain a foothold. This is attributed to a lack of biological adaptation on the part of the micro-organisms and not to immune globulin of maternal origin.⁴²

J. E. GREAVES,
Department of Bacteriology and Biochemistry,
Utah State Agricultural College.

BAHAMAS. A West Indian archipelago constituting a British colony. The Bahamas extend from Florida to Haiti, and consist of some 20 inhabited islands and numerous islets and rocks. The principal islands are New Providence (on which is situated Nassau, the capital), Mayaguana (on which the United States secured naval and air bases on lease in 1940), San Salvador (or Watling's, upon which Christopher Columbus is supposed to have landed in October 1492), Great Bahama, Harbour, Cat, Long, Eleuthera, Great Abaco, Exuma, Crooked, Andros, Acklins, and Great Inagua. The land area is 4,404 square miles, and the population was estimated in 1942 to amount to 73,217, 85 per cent of the inhabitants being colored. A governor (William Lindsay Murphy succeeded the Duke of Windsor on July 29, 1945) is assisted by an Executive Council of eight, a Legislative Council of nine nominated members, and a House of Assembly of 29 elected members. This last body unanimously rejected the proposal made by the British government in 1945 that the West Indian colonies should give consideration to the feasibility of federation. Colonial revenue for 1943 was £614,000, and expenditure was placed at £544,000.

Primary education is compulsory between the ages of 6 and 14. There were 10,731 pupils enrolled in government schools in 1942, and 3,159 in denominational elementary schools; a government secondary school had 62 pupils, and three private secondary schools had 394 pupils. Turtle and sponge fishing were once the chief industries of the colony; in 1939 the sponge fisheries were closed because marine disease had killed off all growth, and it was not until 1945 that the government considered it possible to reopen them. Pearls and ambergris are also found, and sisal hemp and tomatoes are produced for export. Although the drought experienced early in 1945 was the worst for many years, the 1944-45 winter crop of tomatoes was excellent, 150,000 pounds being shipped to the United States and Canada. Silk production is a new industry, Osigian mulberry saplings imported in August 1944 being sold below cost by the British Caribbean Silk Company, which also supplied the necessary silkworm eggs. Exports in 1943, principally sisal and sponges, had a value of £425,000; the United States was the principal customer. The United States was also the chief importer; total imports in 1943 were valued at £1,527,000. While British currency is the legal tender, United States notes of \$5 upward are accepted. A new road on Eleuthera, 71 miles in length, was completed in 1945 from Gregory Town to Bannerman Town. Radio telegraphy links all the inhabited islands; and the radio telephone connects Nassau with Hialeah, Fla., and thence all parts of the world. Owing to the salubrious climate, the islands are a popular winter resort, visitors contributing substantially to the islanders' income. In 1945 six airlines were considering the inclusion of Nassau in their itineraries. See also under **BRITISH WEST INDIES.**

BAHRAIN (BAHREIN). See **ARABIA.**

BALEARIC, bālê-âr'îk, ISLANDS, Span. **BALEARES, bā'la-ä-räs,** a group of 4 large and 11 small islands in the Mediterranean Sea east of Spain, of which they form a province. The principal islands are Mallorca (Majorca), Menorca (Minorca), Iviza (Ibiza), and Formentera. The group has a total area of 1,935 square miles, and a population (1941) of 410,060. Palma (pop. 115,346), on Mallorca, is the capital. The islands

were occupied successively by the Romans, the Vandals, and the Moors, and were captured in 1232 by James I, king of Aragon. Immediately thereafter, under the third son of James I, they were formed into an independent kingdom, which was later united with Spain, to which the Balearics (except for brief periods) have since belonged. The principal agricultural products of the islands are almonds, olives, figs, and other fruits. A considerable number of pigs and some sheep are exported. Mineral products include lignite, sea-salt, superphosphates, coke, and cement. Among the handicrafts are shoemaking, and the production of laces and embroideries, ornamental pottery, and silver filigree. Mahon (pop. 18,000), on Menorca, has a fine harbor, which handles much of the trade of the islands.

BALKAN STATES, the states of the Balkan Peninsula somewhat loosely defined, including Yugoslavia, Albania, Greece, European Turkey, Bulgaria, and Rumania (qq.v.). Rumania and part of Yugoslavia lie north of the Sava-Danube line, to which some writers refer as the northern limit of the peninsula. The total population of the Balkan States at the opening of the Second World War was upwards of 50,000,000.

During the 19th century and the early decades of the 20th, the Balkan States, freeing themselves one by one from Turkish rule, became the scene of a series of wars and war threats which caused them to be known as the "powder keg of Europe," and as the "everlasting Balkans." The unsettled condition of these states during the period in question, due in part to their diverse religious and national interests, was accentuated through the repeated pressure and intervention of the great powers, intent on safeguarding their spheres of influence or in extending their economic or territorial control. Long before the Second World War the term "Balkanization" was being applied generally to the process by which powerful states sought to divide the peoples of small neighboring countries into mutually hostile religious or nationalist factions, the better to dominate them. Some commentators were assuming that the differences among the Balkan peoples were irreconcilable, and some accepted this theory as a justification for continued foreign intervention.

The peace settlement following the First World War, which created the Kingdom of the Serbs, Croats, and Slovenes (later Yugoslavia) left a series of unresolved boundary disputes. Popular unrest in the period between the wars, attributed in part to the inadequacies of the peace settlement and in part to the constrictions of foreign capital upon the local economies, was countered by the establishment of a series of near-Fascist dictatorships in all the Balkan States. Growing Axis encroachments led in 1939 to the Italian invasion of Albania, in 1940 to Italy's invasion of Greece, and in 1941 to the German invasion of Yugoslavia, and Axis domination of the Balkans. Most of the territory of the Balkan States was freed by the end of 1944, through the efforts of the native liberation forces—especially in Yugoslavia, Greece, and Albania—in co-operation with the Allied armies, the process being completed in the spring of 1945 with the collapse of Germany.

Meanwhile, the theory that differences among the Balkan peoples were irreconcilable was being vigorously denied in practice, especially by supporters of the national liberation movement in Yugoslavia. A federated Yugoslavian state emerged

(the foundations of which had been laid in 1943) which its exponents claimed would enable each of the Yugoslav national groups to achieve full political and cultural development, while enjoying the advantages of partnership in a strong and democratic federal union. At the middle of 1945 anti-Fascist governments of national unity were functioning in Bulgaria and Rumania under Allied (predominantly Soviet) supervision. In Greece, where British forces had intervened to insure a regime friendly to Great Britain, the government was encountering reportedly growing opposition by the more active elements of the liberation movement. BAPTIST CHURCHES. The Northern Baptist Convention.—The Northern Baptist Convention, one of the four major groups among some 20 groups of Baptists in the United States and Canada, and with about 1,500,000 members among 10,500,000 in the United States alone, reported a membership in 1945 of 1,570,446. Although Baptists have no general authoritative head, but are guided in their activities as individuals and churches by their state conventions and a general national council, with local associations, city mission societies, and several administrative boards and councils for their missionary and educational activities, they accomplish, nevertheless, an immense amount in these directions.

During the year ended April 30, 1945, there emerged two or three tendencies and programs which were outstanding. First, the denomination launched a two-year program to meet the needs arising especially from the physical devastations of war, and for the financial adjustments necessitated thereby. On the other hand these efforts, both at home and abroad, entailing the raising of \$14,000,000 in money, will be supplemented by two so-called "crusades" to enhance the internal values within the denominational fold itself. One of these is already known as "The Christian Life Crusade," and the other as "The World Mission Crusade," which involve a leadership of considerably over 1,000 laymen and women. It is expected to rebuild demolished churches and schools abroad, and to relieve suffering; and at home to strengthen churches, missions and educational institutions, weakened by present conditions, besides amplifying philanthropic activities.

The foregoing process is effecting widespread co-ordination among the Northern Baptists. At the same time, while the missionary and educational forces show this type of synthesis, the theological elements of the denominational life display a tendency to wider cleavage, which may result in the making of new history. Over against this situation is another almost contradictory: The Southern Baptist Convention, nearly three times as large as the Northern, and much more conservative on the whole, has shown a tendency to resolve the theological differences between the two conventions into forms of co-operation in missionary and educational work, which seems to be as it should be.

In this direction, the Committees on Public Relations, in both conventions, together with that of the National Baptist Convention, incorporated, (colored) with several million members, have augmented their purposes by their plans to form

an agency located in the city of Washington, D.C., to represent the public interests, there, of all Baptists in the country.

Some problems arose in the convention year 1944-45, owing to inability to hold a convention in 1945, on account of governmental wartime regulation; but since the same officers held office as in the year previous, these problems were generally solved. Dr. Anna C. Swain continued as president; and not only has been the second woman to lead the convention in the 38 years of its history, but thus far has been the only woman to preside two years, which she has done with remarkable vigor and wisdom. During the year, her administration was recognized by an additional honorary college degree, received from Brown University—her alma mater.

During the year, the promotion agencies of the denomination selected as their executive director Dr. Reuben E. Nelson to succeed Dr. Earl F. Adams, who served with notable success for six years.

The general statistics for the Northern Baptist Convention for the year were as follows:

Number of churches.....	7,314
Membership of churches.....	1,570,446
Total admission to churches by baptism....	49,255
Number of Sunday schools.....	6,948
Sunday school enrolment.....	901,002
Operating expenditures of churches.....	\$20,470,926
Total benefices of churches, including missions.....	\$6,313,350
Value of church property.....	\$194,150,792

The convention conducted its missionary work as usual in the foreign countries of the Western Hemisphere, but of course it was greatly hampered in the Eastern—though not so much in Africa as in Europe and Asia—and in the Philippines.

(C. M. G.)

The Southern Baptist Convention.—This body of the Baptist denomination is now celebrating its first centennial, having been organized at Augusta, Ga., May 8, 1845. At that time the convention embraced 14 cooperating state conventions with 212 district associations; in 1945 the convention comprised 20 states and 925 district associations. In 1845 there were only 4,117 churches (congregations) with 351,951 church members; in 1945 there were 25,965 churches with 5,667,926 church members. In 1845 there were only 2,005 ordained ministers in the convention; in 1945 there were 24,011. In 1845 there were only 1,218 Sunday schools, with 78,900 enrolled; whereas in 1945 there were 24,626 Sunday schools with 3,380,630 enrolled. In 1845 there were only about 2,000 church houses valued at \$5,000,000; whereas in 1945 there were 24,165 church houses and church property valued at \$254,740,714. In 1845, there were only 13 schools and colleges, with 700 students and school property and endowment amounting to \$500,000; whereas in 1945 there were 61 schools and colleges, with 22,005 students, and property and endowment of \$67,241,594. In 1845, Southern Baptists gave only \$27,012 to all missions and benevolences; whereas in 1944 they gave \$17,303,519. For the statistics of the Southern Baptist Convention see Table on page 93.

Baptists in United States and World

Baptist bodies	1943	1944	Net gains and losses
Negro Baptists	4,162,332	4,202,332	gain 40,000
Northern Baptists	1,556,112	1,555,914	loss 198
Southern Baptists	5,493,027	5,667,926	gain 174,899
Thirteen small bodies	572,640	572,640	
Total in U.S.	11,784,111	11,998,812	gain 214,701
Total in world (1941)	13,314,620		

BARBADOS. A West Indian island, east of the Windward Islands, constituting a British colony. The area is 166 square miles, and the population on Dec. 31, 1943, was estimated to amount to 202,588. Bridgetown (pop. 70,500), on Carlisle Bay, in the southwestern part of the island, is the capital and principal seaport. A governor (Sir Henry Grattan Bushe appointed October 1941) is assisted by an Executive Council, a Legislative Council of 10 nominated members, and a House of Assembly having 24 elected members. The budget for 1944-45 was estimated at £1,007,000, and expenditure was put at £1,170,000. There are 126 primary schools with 29,695 pupils in 1943, eight second grade schools with 1,288 pupils, two first grade schools for boys with 669 pupils, and a first grade school for girls with 295 pupils. Codrington College, with 16 students, is affiliated with Durham (England) University.

Agriculture is the mainstay of the population, 68,000 acres of the total of 106,000 being under cultivation. Sugar is the staple crop, though shipping difficulties during the war caused a large decrease in production. It was estimated that the 1945 sugar crop would amount to 130,000 tons, this figure including 20,000 tons of fancy molasses. For the same period, 1,103 acres of sea island cotton were expected to yield 165 bales of 400 pounds each. Sweet potatoes, cassava, aloes, and tamarinds are also of economic importance. More than 1,000 people are engaged in commercial fishing, the value of the annual catch being about £20,000. Besides sugar and molasses, rum, whale oil, and building lime are exported. Total exports in 1943-44 were valued at £2,338,534, and imports amounted to £2,937,036; the principal imports were cotton textiles, lumber and wood manufactures, foodstuffs, and iron and steel goods. Highway mileage totals 545, of which 272 miles are main roads. There is a good telephone service throughout the island, and cable and wireless external communication. The British West Indian Airways and the Royal Dutch Airlines serve Barbados. See also under **BRITISH WEST INDIES**.

BARITE AND BARIUM CHEMICALS. Record quantities of barite were produced and consumed in the United States during 1944, according to the United States Bureau of Mines. The output for 1944 was 515,136 short tons, 20 per cent over

the 429,298 tons in 1943, and 7 per cent greater than the previous record, 483,391 tons in 1941. The quantity of crude barite sold or used by producers in 1944 amounted to 518,617 tons valued at \$3,558,489 at mine-shipping point, compared with 420,343 tons in 1943 valued at \$2,796,776. Sales of barium chemicals were 73,470 short tons in 1944 valued at \$7,740,318, compared with 77,869 tons valued at \$8,314,537 in 1943. Lithopone sold or used by producers was 142,905 tons valued at \$11,208,891 in 1944, compared with 135,723 tons valued at \$10,745,305 in 1943.

BARLEY. The Department of Agriculture on October 1 estimated the 1945 barley crop of the United States at 277,246,000 bushels as compared with the 1944 crop of 284,426,000 bushels and the 1934-43 average crop of 273,481,000 bushels. North Dakota led in production in 1945 with a crop estimated at 57,336,000 bushels. California was second with 40,122,000 bushels, and South Dakota was third with 33,615,000 bushels.

BARTOK, Bela, Hungarian composer and pianist: b. Nagyszentmiklós, Yugoslavia (then in Hungary), March 25, 1881; d. New York City, Sept. 26, 1945. One of the most important and original figures in modern music, Bartók was also an outstanding specialist in musical folklore, a teacher of wide repute, and the chief and most representative Hungarian composer of the contemporary period.

Bartók made his first public appearance as a pianist and composer at the age of 10. He studied piano and composition with László Erkel in Pressburg (now Bratislava) from 1893 to 1899; and then entered the Royal Academy of Music at Budapest, where he studied piano with István Thomán and composition with Hans Koessler. Graduating from the academy in 1903, Bartók was appointed professor of piano there four years later. About 1905, Bartók, together with his fellow composer, Zoltan Kodály, began to rebel against the popularized and corrupt versions of Hungarian folk music then current, and resolved to seek the authentic Magyar folk tradition among the peasantry. He collected more than 6,000 folk songs of Magyar, Slovak, Rumanian, and Transylvanian origin, and in 1913 brought back 200 Arab melodies from a visit to Algeria.

In 1911 he joined with Kodály to found the New Hungarian Musical Society for the encouragement of contemporary Hungarian music. Bartók first visited the United States in 1927, and returned for a second time in 1940, when Columbia University conferred upon him the degree of doctor of music and commissioned him to transcribe the Milman Parry collection of Yugoslav folk music recordings. Shortly before his death, he was elected a member of the Hungarian Parliament.

Intense dynamism and rhythmic strength have been the chief characteristics of Bartók's music throughout his career, from his early composition's based on national sentiment and racial idioms, to the works after 1920, when he achieved complete maturity and independence. His compositions include the one-act opera, *Duke Bluebeard's Castle* (1911) and two mime-plays, *The Wooden Prince* (1915) and *The Miraculous Mandarin* (1919); *Dance Suite* (1923), Music for Strings, Percussion, and Celesta (1935), *Divertimento for Strings* (1939), and *Concerto for Orchestra* (1943); three piano concertos, a rhapsody for piano and orchestra, and a Concerto for Two Pianos, Percussion, and Orchestra (1941); Violin Concerto (1938), Viola Concerto (1945), and two rhapsodies for violin and orchestra; six string quartets, three violin sonatas, and a Rhapsody for clarinet and violin (1938); *Cantata Profana*, for soli, chorus, and orchestra (1930); Piano Sonata (1926), *Mikrokosmos* (1935), and numerous other piano pieces; also many transcriptions of folk songs.

BASEBALL. See SPORTS.

BASKETBALL. See SPORTS.

BASUTOLAND, South Africa. A native territory under British administration, geographically within the Union of South Africa, but politically not part of it. The Cape of Good Hope province lies on the southeast, and Natal on the east, while the Orange Free State is across the north and west borders of Basutoland. The territory has an area of 11,716 square miles, and at the 1936 census it contained 559,377 natives; the 1,434 white men comprise officials, missionaries, and traders, and there are 341 Indians, and 1,259 of mixed blood. Basutoland is the "Switzerland" of South Africa, consisting of range after range of high mountains, and deep, narrow valleys between them; most of the country is under snow in winter, and there is a high rainfall. Malaria is unknown, and tuberculosis rare. Administratively, Basutoland, the Bechuanaland Protectorate, and Swaziland (qq.v.) are "High Commission Territories in South Africa," sole legislative authority being vested in a high commissioner (Sir Evelyn Baring appointed in 1944); the high commissioner, under the general direction of the Dominions Office, in London, is also high commissioner for the United Kingdom in the Union of South Africa. His functions in Basutoland are exercised by a resident commissioner (Lieut. Col. C. N. Arden Clarke appointed August 1942), who resides at Maseru, the capital. Government revenue in 1943-44 amounted to £547,242, and expenditure was £420,203. The entire country constitutes a single native reserve, a monarchical, aristocratic state under a paramount chief, who has executive and judicial authority; since the death of Paramount Chief Seiso in 1941, the country has been under a regent, one of his widows whose elder son will succeed to the chieftainship when adult. The Basutoland National Council is a sort of native parliament, five of its 100

members being elected annually as a standing executive committee for the country. It was announced in 1945 that the paramount chief and National Council would be consulted henceforth before laws are enacted affecting the Basuto nation. District councils to be established would each elect one member of the National Council; and others were to be nominated jointly by the paramount chief and the resident commissioner.

Educationally, Basutoland is one of the most advanced territories in Africa. Though school attendance is not compulsory, the percentage of literacy is high. There are 900 schools, most of them government-operated or in receipt of state aid; besides secondary schools, there is one high school taking pupils to university matriculation standards, and opportunities are afforded for higher education in the Union of South Africa. The technical schools turn out excellent craftsmen. In 1945 the British government made a grant of £31,750 for expansion of vocational training and improvement of the high school.

Basutoland is primarily agricultural, the principal crops being wheat, corn (maize), and sorghum; the estimated yields in 1943 were, respectively, 360,000, 720,000, and 324,000 bags (of 200 pounds). The territory is the only part of Africa where Canadian hard wheat is cultivated successfully. Other crops include barley, beans, and peas. Cattle are not plentiful (little more than half the number of human beings), but there is an important sheepbreeding industry; in 1943, 7,321,667 pounds of wool, valued at £243,891, were exported. The Basutos are a nation of horsemen, their hardy ponies having a high reputation in Africa. Basutoland is treated as part of the Union of South Africa for customs purposes, receiving 0.88575 per cent of the total customs collected on imports into the Union. There are few roads in the country, two-thirds of all transport being by pack animals; construction of new motor roads and improvement of existing roads was undertaken in 1945 through a grant of £86,000 by the British treasury. A spur line of 16 miles links Maseru with Marseilles, a station on the Bloemfontein-Natal line of the South African railroad system.

BAUXITE. According to the United States Bureau of Mines, the domestic mine production of bauxite dropped sharply in 1944 as the result of the accumulation of excessively large stocks and of decreased demand. The output of crude bauxite in 1944 totaled 3,721,135 short tons (3,162,571, dried basis) compared with 8,156,551 tons (6,980,829 tons, dried basis) mined in 1943, a drop of 54 per cent. The 1944 output was valued at \$14,402,497 compared with \$30,659,900 in 1943. Shipments of crude bauxite from mines to processing plants, consuming plants, and government stockpiles in 1944 totaled 3,676,498 tons (3,124,605 tons, dried basis), a decrease of 53 per cent from 1943. Imports of bauxite in 1944 decreased 64 per cent from 1943, dropping to 627,716 short tons, the lowest since 1939.

BEANS, Dry Edible. The United States, and other bean-eating countries which it may help to supply, will have to get along on somewhat slimmer rations in 1946, if the Department of Agriculture has made no error in its recent forecast. According to the October 1 estimate, the 1945 crop totaled 14,850,000 bags of 100 pounds each, whereas the 1944 crop totaled 16,128,000 bags, while the 1934-43 ten-year average crop was 15,942,000 bags. Michigan remained the big bean producing state with a 1945 crop of 3,989,-

000 bags, while California was a close second with 3,967,000 bags. Texas produced 1,909,000 bags.

BECHUANALAND PROTECTORATE, South Africa. A native territory under British administration, north of the Union of South Africa and south of Northern Rhodesia, bounded on the northeast by Southern Rhodesia, and on the west by South West Africa. The area is 275,000 square miles, and the native population amounted in 1936 to 260,064; with 1,899 whites (officials, missionaries, and ranchers) and 3,793 Indians and persons of mixed blood, the total population was 265,756. Much of the country forms part of the Kalahari Desert; elsewhere the soil is poor and rainfall uncertain. Malaria is common, and because of the presence of the tsetse fly, epidemics of sleeping sickness are not uncommon. Administratively, it is one of the "High Commission Territories in South Africa" (See **BASUTOLAND**); the resident commissioner of the Bechuanaland Protectorate (A. D. Forsyth Thompson) has his headquarters at Mafeking, in British Bechuanaland (part of the Cape of Good Hope Province of the Union of South Africa). With the exception of one mineralized area of 2,000 square miles and several blocks owned and operated by white ranchers, the whole of the Bechuanaland Protectorate is occupied by eight distinct tribes, each with its demarcated reserve of land. There is a strong tribal consciousness, each tribe having autonomy and maintaining its own courts and treasury; the eight ruling chiefs and their principal counsellors constitute a native advisory council, which consults with the resident commissioner. Serowe (pop. 30,000) is the capital of the Bamangwato, the principal tribe. The country is relatively poor, the revenue in 1943-44 amounting to £361,133, and the expenditure being £293,490. Since 1940 the protectorate has received grants from the British treasury totaling £338,747 to be spent on 14 schemes for the development of education and improvement of health and communications facilities. Natives and missionaries jointly manage the schools, maintained for the most part by the native treasuries; in 1943 there were only 128 schools for natives in the entire country. Cattle-rearing is the predominant interest of the people, and the chief source of their wealth. The number of cattle is estimated at 836,843, and there are also 551,091 sheep and goats. Statistics of exports and imports are included with those of the Union of South Africa, the Customs Department of which pays a fixed annual percentage of its receipts to the protectorate. The Bechuanaland Railway, part of the main route from Capetown to the Belgian Congo, is operated by the Rhodesia railway administration.

BEER-HOFMANN, Richard, Austrian poet and dramatist: b. Vienna, 1866; d. New York City, Sept. 26, 1945. The last important survivor of the brilliant Viennese neoromantic group which included Arthur Schnitzler, Herman Bahr, and Hugo von Hofmannsthal, Dr. Beer-Hofmann was best known for his Biblical verse plays, *Jakobs Traum* (1918) and *Der Junge David* (1933). Dr. Beer-Hofmann attended the University of Vienna and as a young lawyer published his first book, *Novellen*, in 1893. His most famous poem, *Schlaflied für Miriam*, appeared five years later, and in 1900 his only novel, *Der Tod Georgs*, was published. *Der Graf von Charolais* (1905), Beer-Hofmann's version of the 17th century tragedy, *The Fatal Dowry*, by Massinger and Field,

was widely performed in Austria and Germany and won the *Volksschillerpreis*. During the early 1900's he began his major work, a dramatic trilogy entitled, *Die Historie von König David*, to include a prologue, *Jakobs Traum*; *Der Junge David*; *König David*; and *David's Tod*. The prologue, *Jakobs Traum*, written between 1909 and 1915, was presented by the Burgtheater in Vienna and by Max Reinhardt in Berlin after the First World War; while *Der Junge David* took over 25 years for completion. Dr. Beer-Hofmann was an extremely slow literary artist, writing only when he felt he had something to say. Six words a day were reported to have been his average pace. At the suggestion of Max Reinhardt, from 1928 to 1930 he supervised the production of Goethe's *Iphigenie auf Tauris*, both in Vienna and Berlin; and in 1932, the centenary year of Goethe's death, he adapted *Faust*, Parts I and II, for performance by the Vienna Burgtheater in one evening. After the German invasion of Austria, he spent some time in Switzerland and then came to the United States in 1939. In May 1944 he received the American Academy of Arts and Letters award for distinguished achievement. Among his other works are *Gedenkrede auf W. A. Mozart* (1906); *Vorspiel zum König David*, written in 1916 and published in 1931; *Das Goldene Pferd*, a pantomime written in 1921 and published in 1930-32; and *Herbstmorgen in Österreich*, a volume of memoirs completed in 1944.

BELGIAN CONGO. A Belgian colony in west central Africa, with an estimated area of 902,082 square miles, a native population, principally of Bantu origin, numbering (1944) 10,389,155, and a white population of 34,888, of whom 22,668 are Belgians, 2,594 Portuguese, 1,428 Italians, 1,370 British, 3,293 Greeks, 580 Dutch, 454 French, and 613 Americans. There are six main native languages. King Leopold II of the Belgians was recognized by the Powers in 1884 as sovereign of the territory, which was annexed to Belgium on Nov. 15, 1908. Under the administration of the Minister of Colonies, the Belgian government is represented in the colony by a governor general, who is aided by a vice governor general, one or more state inspectors, and six provincial governors. The Legislative Chambers consider the budget and yearly report on the administration of the colony. The Belgian Congo is divided into 6 provinces and 16 administrative districts, each of which is further divided into numerous administrative territories. The districts of Ruanda and Urundi, formerly part of German East Africa, with an area of 20,152 square miles and an estimated population of 3,767,002 (December 1943) and 2,169 Europeans, became Belgian territory as mandatory of the League of Nations, and were united administratively with the Congo under a vice governor in August 1925. Pierre Ryckmans, as governor general of the Belgian Congo, visited the United States in April 1944 as a guest of the State Department.

Production.—The country in most areas is fertile and productive. There are extensive forests of oil palms, supplying an increasing trade in palm oil, palm kernel oil, and palm nuts. Cotton, fibers akin to jute, rubber, and coffee are successfully grown. Other products are copal gum, sugar, lumber, maize, groundnuts, bananas, cacao, rice, hides and skins, beeswax, and ivory. Léopoldville, the leading city, now ranks first in Africa in the manufacture of textiles, cement and beer. Mining is the chief industry, minerals in-

cluding copper, diamonds, gold, silver, tin, cobalt, uranium, radium, zinc, manganese, tantalite, and iron. In the Katanga District there are enormous deposits of copper and a large supply of radium. Gold production in 1941 amounted to 18,517 kilograms, and the diamond output was 9,133,757 carats. Exports in 1943 comprised 188,704 metric tons of copper, 10,541 tons of tin, 8,596 tons of cassiterite (72 per cent tin content), 14,872 kilograms of gold, 10,237,000 carats of diamonds, 99,115 tons of palm oil. Compared with the average output for the period 1937-39, industrial production in 1943 increased 130 to 200 per cent. Normally the Belgian Congo supplies the world with more than two thirds of its industrial diamonds.

Transportation.—On Jan. 1, 1942 there were 3,106 miles of railway in the colony, 53,775 miles of highways, and 6,864 miles of navigable waterways. There are regularly scheduled air services between Léopoldville and Lagos (Nigeria), Léopoldville and Stanleyville, Stanleyville and Elisabethville, and Stanleyville and Usumbura. Before the Second World War and the German occupation of Belgium, there was a weekly air mail service between Elisabethville and Léopoldville and Brussels (6,368 miles). This has been re-established since the liberation. The Pan American Airways service between Miami and Léopoldville instituted in November 1940 was suspended in December 1944, following the loss of the *China Clipper* at Trinidad. Regular sailings between New York and Matadi are operated by the Barber Steamship Lines and the Booth American Shipping Corporation. Post offices number 146. There are 65 wireless and 78 telegraph offices with 4,209 miles of telegraph lines and 4,000 miles of telephone lines.

Foreign Trade.—In 1944, imports into the Belgian Congo were valued at 2,918,000,000 Congolese francs; exports at 4,621,000,000. Imports into and exports from the Ruanda-Urundi Territories amounted respectively to 111,000,000 and 189,500,000 million francs. The United States was by far the largest single supplier and purchaser, accounting for approximately 40 per cent of the imports and one-third of the exports. Its purchases consisted mainly of metals and ores, palm oil, fibers, gum copal, and rubber; its shipments, of basic steel items, machinery, rolling stock, automotive vehicles and parts, oils and greases, pharmaceutical products, textiles, enamelware, canned foods, and flour.

BELGIUM. A kingdom of Europe, lying north of France and southwest of Holland. It has an area of 11,775 square miles and an estimated population (Dec. 31, 1941) of 8,257,392. Brussels, the capital, had in 1938 a population (with its suburbs) of 912,774. Other large cities, with their populations in 1938, are Antwerp (273,317), Ghent (162,858), and Liège (162,229). The kingdom of Belgium was set up in 1830 as the result of a revolution against the Netherlands, of which it had been a part since 1815. Its neutrality was guaranteed by the powers in 1831, and it was formally recognized as the kingdom of Belgium by all the states of Europe in 1839. Under the Belgian constitution (of 1831) legislative power was vested in a king, a Senate, and a Chamber of Representatives. On Feb. 23, 1934, Leopold III was crowned king, after the death of his father, Albert, on Feb. 17, 1934. On May 10, 1940, Germany, without a declaration of war, launched a blitzkrieg invasion of Belgium, the Netherlands, and Lux-

embourg, with land and air forces. On May 28, King Leopold III surrendered his armies to Germany, himself remaining in Belgium as a prisoner of war. The Belgian constitutional government fled, first to France and then to England (October 1940). King Leopold refused to form a puppet government under the Nazis or to collaborate with them. By June 3, 1940, the entire country was under Nazi occupation. On May 18, 1940, Hitler proclaimed reincorporation into the Reich of the Belgian districts of Eupen, Malmédy, and Moresnet, ceded to Belgium by the Versailles Treaty (1919). The German occupation of Belgium continued amid growing opposition by the resistance movement (especially from February 1944) until the expulsion of the Germans by the Allied armies during September (1944). In the meantime, on September 8, Prime Minister Hubert Pierlot and most of his Cabinet had returned from London to Brussels.

Production and Industry.—The full effect of the German invasion of Belgium on the country's production and industry is not yet completely known. Many factories were excessively operated by the Germans during the occupation, and as a result most of the industrial equipment was worn out. Moreover, during the battle for the Rhine, the Germans launched a large number of robot bombs on key industrial points, causing extensive damage. For instance, the most important industrial center, Liège and its suburbs, was 65 per cent destroyed by robot bombs after the liberation of Belgium.

Of the total area of prewar Belgium (3,065,660 hectares), 1,832,453 hectares were under cultivation in 1938.

The country's greatest mineral resources are coal, iron, and zinc ores. Coal production under normal conditions approximates 30,000,000 metric tons annually; pig iron over 3,000,000 metric tons; steel, over 3,000,000 tons. Zinc production approximates 220,000 metric tons a year.

Belgium is normally a highly industrialized country, manufacturing products including cotton fabrics, linen goods, woolen goods, chemicals, cement, tiles, window and plate glass, table glass, furniture, rolled steel and zinc, railroad equipment, and lace. Before the war there were 36 sugar factories, 9 sugar refineries, 19 distilleries, 1,223 breweries, 27 margarine factories, 47 vinegar factories, and 9 match factories.

Finances.—The total public debt on Dec. 31, 1940, amounted to 74,393,000,000 francs, including 12,843,000,000 francs of 1914-18 war debts and 3,059,000,000 francs representing the postal checking accounts. Excluding these two items, the public debt amounted to 58,491,000,000 francs, compared with 46,254,000,000 on Dec. 31, 1939. By July 1, 1945 the total public debt had grown to 215,000,000,000 francs, the increase being caused mainly by German levies. The cost of occupation alone amounted to 12,000,000,000 francs a year. Budget estimates for 1945 amounted to 30,000,000,000 francs.

Communications.—Belgium had 6,560 miles of roads in 1938, of which 5,580 were state roads. Navigable waterways (rivers and canals) totaled about 1,000 miles, exclusive of the 70-mile Albert Canal from Liège to Antwerp, opened for traffic in 1939. Railways in January 1939 totaled 3,189 miles of main line, and 3,879 miles of provincial lines. About 10 per cent of the tracks were destroyed by the Germans during the occupation. Post offices in 1938 numbered 1,733; and in the same year there were 6,194 miles of telegraph lines, and 1,950,470 miles of telephone line in

service. The merchant fleet on July 1, 1939 comprised about 200 vessels of 408,418 tons net; the fleet was reduced to 88 vessels of 353,997 gross tons at the beginning of 1940, and still further losses were sustained in 1940 and 1941. However, many Belgian merchant ships, which had been torpedoed, were later replaced, and in 1943 and 1944 the Belgian Merchant Marine did its part in the Allied war effort, carrying war materials to the fighting fronts.

Principal Events, 1945.—Completely liberated in September 1944, Belgium, a few months later, went through the terrible experience of a second German invasion in one and the same war. In the early hours of December 16, Field Marshal von Rundstedt launched a last counter-offensive which knifed deeply into the Allied lines covering southern Belgium and northern Luxembourg. By December 28, when the German drive through the Ardennes was brought to a halt before it could reach the Meuse River, roughly one fifth of Belgium was again in German hands,—but not for long. The Nazi thrust was broken decisively in the "Battle of the Bulge" and by late January all of Belgium was liberated once more. The cost, to the Belgians, of the short-lived re-invasion was fearful; most of the neat Ardennes towns overrun by Rundstedt's drive lay in ruins and hundreds of civilians had been wantonly massacred by the returning Gestapo. In the following months, the loss of civilian life, and wholesale destruction of buildings, continued on an even greater scale as the Germans kept two of Belgium's principal cities, Antwerp and Liège, under continuous fire by robot bombs and V-2 rockets, in the futile attempt to cut the supply lines feeding the Allied invasion of Germany. Antwerp stood it for six full months, with 2,917 persons killed and 57,000 houses destroyed; Liège lost 27,000 houses in three months, and counted over one thousand dead.

Premier Hubert Pierlot and his Cabinet resigned February 7 in the face of widespread and increasingly vocal opposition, especially from the former resistance movement. Prince Charles, regent of Belgium, then invited Achille van Acker, Socialist leader and labor minister in the Pierlot Cabinet, to form a new government. He succeeded on February 11 in bringing about a coalition ranging from the conservative Catholic Party to the Communists; of the former "London government," only one member, Foreign Minister Paul-Henri Spaak, was retained.

A new and far more serious crisis broke out in Belgium after the liberation, early in May, of King Leopold who had been confined in a German prison camp near Salzburg, in the last phase of the war. The king, owing to his capitulation in May 1940, his subsequent marriage to a commoner, and also because of his headstrong character and alleged authoritarian leanings, had lost most of the popular sympathy he once enjoyed. All Belgian political parties, with the sole exception of the Catholics, opposed the king's return to his throne; the most determined opposition came from the former resistance movement which felt it had been let down by the king during the hard years of German occupation.

His manifest unpopularity notwithstanding, Leopold made public his determination to return to Brussels and resume his royal functions which had been exercised, since liberation, by his younger brother Charles. Premier van Acker and other political leaders vainly attempted to change the king's mind during a series of flying visits to his new headquarters at St. Wolfgang, Austria.

When Leopold made actual preparations to return, van Acker's Cabinet on June 16 tendered its resignation to the regent amid indications that a general strike would be called and grave disorders would break out as soon as the king set foot on Belgian soil. In the face of this determined opposition, Leopold desisted and the Cabinet remained in office. However, on July 17 the Catholic Party withdrew its six representatives in the government and announced that it would return to the opposition. This move of Leopold's supporters was instantly followed by an act of Parliament which in effect exiled the king for an indefinite period. The crisis ended on July 26 when the Chamber of Deputies gave van Acker a 95 to 68 vote of confidence. Late in August it was learned that King Leopold had applied for permission to live in Switzerland and would shortly take up a residence in a villa on Lake Geneva. He arrived there on October 1.

The purge of collaborationists was conducted in Belgium with greater severity than in any other liberated country of northwestern Europe. The courts passed out death sentences freely—1,150 up to June 1, 1945,—most of them in absentia, however; about 28,000 were held for trial. However, Belgium's arch-traitor, the Rexist chieftain Léon Degrelle, who had served with the Wehrmacht on the eastern front, succeeded in escaping to Spain in a German plane. The Spanish authorities steadfastly rejected Belgian and Allied demands for the extradition of Degrelle.

Belgium's economic situation continued grave throughout the year, despite steady progress in many fields. The winter of 1944-45 was unusually severe, adding to the country's transportation difficulties by freezing the waterways. As elsewhere in Europe, coal was the chief problem. Lack of fuel caused widespread unemployment in industry and hampered the restoration of transport facilities. Although imports from the United States and other countries rose steadily, the Belgians manifested some dissatisfaction at the slow delivery of vitally needed supplies. The cessation of lend-lease in late August did not affect Belgium as it did other European countries, for in the case of Belgium reverse lend-lease had long exceeded lend-lease by a vast margin. According to an official Belgian statement, by August 15 the United States had supplied Belgium with \$22,820,520 worth of goods, as compared with Belgian deliveries to the United States in the amount of \$102,600,000. In the words of the statement, "the balance is therefore very much in Belgium's favor and it is hoped that deliveries from the United States will be intensified to make up the big difference." The United States, in mid-October, recognized a lend-lease balance of \$90,000,000 in favor of Belgium and agreed to speed up deliveries to that country.

BELIZE. See **BRITISH HONDURAS.**

BELLAMANN, Henry (Heinrich Hauer Bellamann), American author, musician, and educator: b. Fulton, Mo., April 28, 1882; d. New York City, June 16, 1945. Successful both as a writer and as a music educator, Dr. Bellamann is best known to the general public for his best-selling novel, *King's Row* (1940), a frank chronicle of life in a small Midwestern town which was adapted into a popular film. He studied piano in Europe with Isidor Philipp and organ with Charles M. Widor. After his return to the United States, he served from 1907 to 1924 as dean of the School of Fine Arts of Chicora College for Women at Columbia, S.C. He was chairman of

the examining board of the Juilliard Music Foundation, 1924-26, and dean of the Curtis Institute of Music, 1931-32. Dr. Bellamann's first book, *A Music Teacher's Notebook* (verse) was published in 1920, and his first novel, *Petenera's Daughter* in 1926. Later novels include *Crescendo* (1928); *The Richest Woman in Town* (1932); *The Gray Man Walks* (1936); *Floods of Spring* (1942); and *Victoria Grandolet* (1944).

BELORUSSIAN SOVIET SOCIALIST REPUBLIC.
See UNION OF SOVIET SOCIALIST REPUBLICS.

BENCHLEY, Robert Charles, American writer and actor: b. Worcester, Mass., Sept. 15, 1889; d. New York City, Nov. 21, 1945. One of the most versatile and successful humorists in America, Mr. Benchley was an author, playwright, columnist, dramatic critic, radio star, and motion picture comedian. According to Stephen Leacock: "None excels Robert Benchley in the ingenious nonsense of verbal humor. As a writer of nonsense for nonsense's sake, he is unsurpassed." Benchley's success as an actor depended on his uncanny ability to mimic the average man, bewildered, always trying to put a little better appearance on things than the facts warranted, and chuckling off his own discomfiture.

Benchley attended Phillips Exeter Academy and was graduated in 1912 from Harvard, where he had served as editor of the *Lampoon*. He was employed in the advertising office of the Curtis Publishing Company (1912-14), and then worked in the personnel department of the Russell Paper Company in Boston (1914-15). In 1916 he was named associate editor of the New York *Tribune Sunday Magazine*, and the next year, editor of the New York *Tribune Graphic*. During 1917-18 he served as secretary to the Aircraft Board in Washington, D.C. After the war, he became managing editor of *Vanity Fair* (1919-20); conducted a column, "Books and Other Things," in the New York *World* (1920-21); and was made dramatic editor of *Life* (1920-29), and an editor in 1924. In 1929 he became dramatic critic of *The New Yorker*, a post he held until 1940. His first recorded appearance on the professional stage came in 1923, when he delivered his famous monologue, "The Treasurer's Report," for the *Music Box Revue*. In 1929 he began appearing in movie-tone shorts for the Fox Film Company, and in 1937 was signed by Metro-Goldwyn-Mayer as writer, director, and actor. Among his better known short subjects are *The Love Life of the Polyp*; *How To Vote*; *How To Sleep* (which won the Motion Picture Academy Award for the best movie short of 1936); *An Evening Alone*; and *Raising a Baby*. He had also appeared in occasional feature pictures, including *The Reluctant Dragon*; *Week-end at the Waldorf*; *Kiss and Tell*; *Duffy's Tavern*; and others. Since 1937 he had at various times appeared or acted as master of ceremonies on radio broadcasts. Among his books are *Of All Things* (1921); *Love Conquers All* (1922); *Pluck and Luck* (1925); *The Early Worm* (1927); *No Poems* (1932); *From Bed to Worse* (1934); *My Ten Years in a Quandary* (1936); *After 1903, What?* (1938); *Inside Benchley* (1942); and *Benchley Beside Himself* (1943).

BENDIX, Vincent, American engineer, inventor, and industrialist: b. Moline, Ill., 1882; d. New York City, March 27, 1945. Founder of the

Bendix Helicopters, Incorporated, Vincent Bendix was responsible for automotive devices and improvements in the world of transportation and aviation that ranged from the early Bendix self-starter to the modern helicopter. His self-starter made automobile self-starting practicable and has been used on more than 65,000,000 cars. He later introduced into the United States the first volume production of 4-wheel automobile brakes. His other products include generators, radio direction apparatus for ocean-going vessels, magnetos, laundry machinery, and landing gears. He founded the Bendix Aviation Corporation in 1929, and under his direction it became one of the leading industries in the field. He resigned as chairman of the board of this company in 1942, and formed Bendix Helicopters, Inc., to develop a popular type helicopter four-passenger sedan for mass production after the war. Mr. Bendix was the founder and sponsor of the Bendix Transcontinental Air Race and donor of the Bendix Trophy. He also sponsored the International Glider Meet at Elmira, N.Y., and a trophy awarded at these competitions.

BENES, Eduard, Czechoslovak statesman: b. Kozlany, Bohemia, May 28, 1884. On May 10, 1945, after the German surrender, Czechoslovakia's President Beneš returned to his nation's capital after six-years' exile, and began the task of rebuilding his country and re-establishing its independence. Beneš has fought for the existence of a free Czechoslovak state since 1915, when with Thomas Garrigue Masaryk, Czech philosopher-statesman, he organized the Czechoslovak nationalist movement, and subsequently founded the Republic of Czechoslovakia, officially recognized by Britain, France, and the United States in 1918.

In December 1943, President Beneš was present at the signing of a 20-year friendship and mutual assistance pact between his country and Soviet Russia. A champion of co-operation with the Soviet throughout his years of public service, he has consistently maintained that the Soviet Union represented the forces of peace, not war. He was also convinced that the Second World War could not be won without that ally's help, and is equally convinced that the peace cannot be secured without the closest collaboration with Russia.

President Beneš has published numerous books and pamphlets on politics and political science. Among his more recent works in English are the following: *Germany and Czechoslovakia*, 2 vols. (Prague 1937); *Czechoslovakia's Second Struggle for Freedom* (London 1940); *Democracy Today and Tomorrow* (New York and London 1940); *The New Order in Europe* (London 1941); *Towards a Lasting Peace* (London 1941); *Future of the Small Nations and the Idea of Federation* (London 1942); *The Organization of Post-War Europe* (New York 1942); *The Way to Victory* (London 1942); *What Would Be A Good Peace* (London 1943); *Czechoslovak Policy for Victory and Peace* (London 1944).

BENTONITE. In 1914 bentonite production increased 14 per cent to over a half million tons, and for the sixth consecutive year established a new record, according to the United States Bureau of Mines. Bentonite sold or used by producers in 1944 was 546,768 short tons, valued at \$3,605,988, as compared with 480,202 tons, valued at \$2,997,754 in 1943. Although consump-

principal expansion was in rotary drilling mud. Bentonite owes its growth in this market not only to the increase in the number of holes drilled but also to the greater average depth and to the relatively higher proportion of holes drilled with rotary rather than cable equipment. Consequently, whereas in 1944 one third more oil wells were drilled than in 1943, 76 per cent more bentonite was consumed in drilling mud.

BERMUDA. A group of 360 small islands in the western Atlantic ocean, 580 miles east of Cape Hatteras and 697 miles from New York, constituting a British colony. Not more than 16 of the islands are inhabited, the largest being the Main Island, St. Georges, St. Davids, Somerset, and Ireland. The aggregate land area of all islands is 19.3 square miles, and the population in 1942 numbered 32,857, of whom more than half were colored. Hamilton (pop. 2,978), the capital, is located on the Great Sound, Bermuda or Main Island. In 1940 the United States obtained on a 99-year lease an air base at the eastern end of St. Georges and a naval base at the western end, together aggregating one twentieth of the total area of the island, and in 1941 Tucker and Morgan islands, in the Great Sound, were also leased for aviation purposes; Ordnance Island, though not leased, was also used by the United States as a submarine base until July 8, 1945, when it was restored to the colonial authorities. In 1944 a Royal Canadian naval base ("H.M.C.S. Somers Islands") was commissioned in St. Georges for training purposes; it was closed in August 1945. The governor (William Addis became acting governor in 1945) is assisted by Executive and Legislative councils, with seven and nine nominated members respectively, and by a House of Assembly of 36 elected members; Bermuda's Parliament is the oldest in the British colonies. The budget for 1945 showed an estimated revenue of £782,100 and expenditures of £838,123; at the beginning of 1945 the colony's reserve fund amounted to £308,000. While education is compulsory between the ages of 7 and 13, the government conducts no schools, giving grants in aid to 29 of the 43 primary schools; there is also a garrison school and a naval school. Some 1,400 acres of Bermuda's 12,360 acres are under cultivation. Onions, potatoes, and green vegetables, together with cut-flowers and lily bulbs, are produced in large quantities, mostly for export; total exports in 1943 were valued at £158,553. Imports in 1944 totaled £2,456,678, representing a decrease of £125,078 over the figures for 1943 (£2,581,756); in 1944 most imports came from the United States (£1,666,077), Canada taking second place (£498,455).

The climate is mild, and the islands are frequented as a health resort. Hotels were reopened for civilian use in 1945, and United States passports were no longer required for entry. The currency, weights, and measures are British, although considerable American currency is in circulation. Automobiles are not allowed, tourists covering the island by horse carriage or bicycle. While disclaiming any legal obligation, the United States government offered in March 1945 to surface, at a cost of \$428,000, 18½ miles of Bermuda's main roads damaged by motor traffic since inception of the American bases, the colony to pay \$150,000, estimated to be one third of the value of damage caused by other vehicles. A clause in the Bermuda lease provided that after the war United States personnel shall not use motor vehicles without the permission of the

local authorities; the House of Assembly considered in 1945 a request that the two American commanders be allowed to operate cars for personal use after the war. Passenger ship sailings from New York to Bermuda were resumed in August 1945, and the Bermuda Airways Company was formed to operate a service between the colony, the United States, and Canada.

BERNADOTTE, Folke, Swedish count: b. c.1894. In late April 1945, Count Bernadotte served as intermediary carrying a German offer of surrender from Heinrich Himmler to Britain and the United States, and took back the answer that only unconditional surrender to all the Allies, including Russia, would be acceptable. An active goodwill ambassador in fostering Swedish-American relations before the Second World War, Count Bernadotte arranged and supervised the exchange of prisoners between Germany and the Allies during hostilities as vice chairman of the Swedish Red Cross. In peace years, he headed the Swedish delegations to the Chicago and New York World Fairs. He is a nephew of Sweden's King Gustav; his father renounced his rights to the throne to marry a commoner. Count Bernadotte's wife is the former Estelle Manville of Pleasantville, N.Y.; he has two sons.

BESSARABIA. See RUMANIA; UNION OF SOVIET SOCIALIST REPUBLICS.

BETTER BUSINESS BUREAUS. The end of the war brought a change in emphasis to the work of the Better Business Bureaus. Whereas during the war they were active in combating wartime deceptions, they thereafter turned their attention to postwar problems related to the advertising and selling of merchandise, securities and service.

As public agencies of private business, the Better Business Bureaus serve to combat fraud and misrepresentation, for the protection of consumers and investors and of honest business. Much of their work is of an educational and preventive nature—seeking to stop losses before fraudulent or unfair practices have made real headway. For the postwar period they have adopted an expanded program of service and usefulness to the public.

A prime purpose of the Better Business Bureaus is to protect the purchaser of war bonds and others who have stored up savings against loss at the hands of the scheming and the unscrupulous. Accordingly, these voluntary agencies of business have set as their goal increased vigilance in those fields most vulnerable to exploitation. They include the securities field, real estate, new businesses, general merchandise, employment opportunities, solicitations of doubtful character and questionable practices by advertising media.

As a corollary to this, the Better Business Bureaus in 1945 devoted increased attention to protecting the returning veteran. In particular, they acted to protect him against the pitfalls of starting a new business. At the same time, they investigated numbers of enterprises which were seeking to attract veterans as investors. These services to veterans, free of charge, are being continued. The bureaus published, early in 1945, a helpful booklet entitled *Facts Veterans Should Know Before Starting a Business*. Following the advice contained in that booklet, it is believed, will help a veteran to guard against investing in any enterprise before investigating it properly and thoroughly.

As a means of maintaining public confidence

in retailing and of insuring fair competition, the Better Business Bureaus prepared a *Guide for the Advertising and Selling of Government War Goods*. In it are contained a series of recommendations designed to help retailers avoid misrepresentations in advertising and selling this merchandise. By following these suggestions, it was believed, retailers could contribute to an orderly disposal of these surplus goods, without public confidence being impaired as a result of misrepresentation.

In October 1945, these bureaus began the distribution of a new, revised edition of a *Guide for Retail Store Advertising and Selling*—existing since 1930—which has for the past 15 years been a standard source of information on the accurate description of merchandise, and is in constant use by retailers.

Wartime misrepresentations of merchandise quality and various instances of advertising related to black markets, engaged the attention of the bureaus in the first half of 1945, and they obtained good results against rackets trading on the general shortage of goods, and distributed protective information to the public on questionable appeals for solicitations.

There are now 90 Better Business Bureaus in chief cities throughout the United States and Canada. More are being established. They are all members of the National Association of Better Business Bureaus, which functions as a conference group. In addition, there is the National Better Business Bureau, with offices in New York City, which acts exclusively in the field of national advertising and selling.

The bureaus are voluntary, non-profit agencies of business which are supported entirely by the annual subscriptions or contributions of their members. Their membership includes companies in the principal branches of commerce, finance and industry, including, of course, advertising media, newspapers and other periodicals, radio stations, and so on.

Acting upon inquiry and complaint, the bureaus give facts and protective information, without charge, to all who seek them. Upon complaint, or on their own initiative, they investigate fraud and misrepresentation in all forms of advertising and selling. Although not government agencies in themselves, they enjoy the co-operation of the prosecuting and regulatory agencies of government, federal, state and local, in their voluntary work to combat fraud and unfair practices.

H. J. KENNER,
General Manager, Better Business Bureau of New York City, Inc.

BEVIN, Ernest, British labor leader and statesman: b. Winsford, Somerset, England, March 9, 1881. On July 27, 1945, Mr. Bevin replaced Anthony Eden as British foreign minister, after Labour's sweeping victory in Britain's first general election since 1935. As minister of labour and national service in Churchill's coalition government, he created a labour supply board, outlawed strikes, and mobilized British manpower for his country's war industry.

Perhaps his greatest achievement in the labor field came in 1922, when he amalgamated 45 unions into a national body known as the Transport and General Workers' Union. He was the union's general secretary until May 1940, when he became labour minister in the Churchill government; he resumed the union secretaryship in May 1945.

In 1926, while a member of the Trade Union

Congress, he took a prominent part in the general strike, a nationwide movement which collapsed largely through Churchill's efforts. In 1931, he stood unsuccessfully for Parliament from Gateshead. He was elected chairman of the general council of the Trade Union Congress in 1936, and was re-elected the next year for a second annual term. Shortly after he became labour minister in 1940, he was elected to the House of Commons to represent the Central Wandsworth constituency of London, and in October 1940, was given a seat in the small inner war Cabinet.

After Germany's defeat, Mr. Bevin worked out plans for the release of all conscripted women in factories, and for the partial demobilization of the armed forces. In May 1945, he resigned his post in the coalition Cabinet to campaign for the election of a labour government. On July 28, as new secretary of state for foreign affairs, Mr. Bevin accompanied Prime Minister Clement Attlee to the Potsdam Conference. In September, he attended the Council of Foreign Ministers convened in London.

A collection of Mr. Bevin's speeches and radio addresses has been published under the title *The Job To Be Done* (1942).

BHUTAN, bōn-tān'. A semiautonomous state on the northeastern frontier of India. The state occupies a unique position, in some respects being regarded as within the Indian Empire (for instance, the ruler attends durbars in India) and in others being treated as a distinct entity (as, for instance, for purposes of the census). While there is complete internal autonomy, Bhutan's external relations are controlled by the British government in consideration of payment to the ruler of an annual subsidy of (since 1942) 200,000 rupees. The area of the country is about 18,000 square miles, and the population numbers some 300,000. The people practice a debased form of Buddhism. The hereditary ruler since 1926 has been Maharaja Sir Jig-me Wang-chuk. The annual revenue of the state amounts to about £30,000 a year. Punaka is the winter capital, and Tashi-Chodzung the summer capital. The castles at these and certain other places have guards which constitute the country's sole armed forces. Indian corn, rice, and millet are cultivated, and lac, wax, and musk are gathered. Muzzle-loading guns and steel swords are manufactured, and there is some textile weaving. Bhutan's trade with British India amounts to about £65,000 a year.

BIBLE SOCIETY, American. See AMERICAN BIBLE SOCIETY.

BIDAULT, Georges, French government official: b. Moulins, near Vichy, France, 1899. M. Bidault, France's foreign minister and head of her delegation to the San Francisco Conference (April 25-June 26, 1945) is a new figure in French politics. An educator and journalist by profession, he was mobilized in 1939; saw front line action against the Nazis; was taken prisoner and later released. He returned to Lyons (then unoccupied), and took a teaching job to provide a blind for his underground activities. For a time he was liaison agent between the underground and the Free French, and in 1943, became president of the National Council of Resistance, when his predecessor was taken by the Germans. He lived in hiding for six months before the liberation of Paris, after the Nazis identified him as the resistance leader. It was

he who rallied the guerrilla forces of Paris in August 1944, and he to whom the German commander surrendered.

Georges Bidault is the son of an insurance company executive. His education included six years' study at a Jesuit school in Italy. On his return to France, he took an active part in the Catholic Youth movement. He was later graduated with honors from the Sorbonne; taught history at Valenciennes; and at the age of 30, took a teaching post at one of Paris' leading high schools. He was also an editor of the prewar Paris daily, *L'Aube*, official organ of the Popular Democratic Party, a Leftist Catholic group.

Since his appointment as foreign affairs minister in September 1944, he has distinguished himself at several United Nations conferences. He helped de Gaulle negotiate the Franco-Soviet pact of alliance and mutual assistance, signed in December 1944. In late August 1945, Bidault accompanied General de Gaulle to the United States. In September, he attended the meeting in London of the Council of Foreign Ministers.

BIOCHEMISTRY. The end of the war has made it possible for biochemists to return to their peacetime research. Plans are well under way for publication in the scientific journals of many of the contributions made during the war. Technical and scientific missions to former enemy countries are also engaged in making available the results of scientific research in Europe and Japan. The tremendous contributions of science to the winning of the war and to the welfare of society has aroused great enthusiasm and interest in science and a growing awareness of the need for large scale appropriations for research by the federal government.

Among the noteworthy developments in the field of plant biochemistry has been the use of plant growth substances as selective weed killers. These compounds, which in small amount stimulate growth of plants, have been found to depress growth when applied in higher concentrations. Many types of weeds appear to be more susceptible to these substances than are certain grains. Application of 25 pounds α -naphthylacetic acid per acre to a weedy field just after sowing with oats killed the weeds. Eighty-four per cent of the weeds failed to germinate and those which did soon died. The oats were only temporarily retarded and recovered fully. Another substance, sodium-4-chloro-2-methyl phenoxyacetate, at a concentration of one pound per acre resulted in complete eradication of a weed (yellow charlock) without affecting the oats. Extension of such studies should be of great value to agriculture. Chemical sprays using pentachlorophenol and dinitro secondary butylphenol have also been employed to prevent pollen production and release in ragweed. These materials, when sprayed at a level of 100 gallons per acre, destroy ragweed and prevent pollen release. They are not ideal since they are toxic to other vegetation, but further studies may provide a specific method of preventing release of pollen from ragweed and prove of great value in the control of hay fever and other pollen sensitivities.

Intermediary Metabolism.—Use of radioactive and heavy isotopes as tracer substances has disclosed additional information about the chemical pathways along which the body channelizes its vital processes. By using radioactive strontium and calcium, the way in which vitamin D promotes mineralization of rachitic bone has been investigated. Vitamin D has been found to act

partly by increasing the absorption of calcium from the intestinal tract and partly by increasing the retention of calcium and strontium in the rachitic bone. After feeding cholesterol, containing deuterium (H^2) as a label, to a woman in the eighth month of pregnancy, pregnanediol-3 α , 20 α was isolated from the urine and found to contain deuterium. Since pregnanediol is a metabolic product of progesterone, one of the female sex hormones, it would appear that the hormone progesterone can be synthesized from cholesterol. The occurrence of small amounts of pregnanediol-3 α , 20 α in the urine of normal males or in females whose ovaries have been removed has been explained by the finding that the adrenal cortical hormone, desoxycorticosterone, is also converted to pregnanediol. About half of the carbon atoms in cholesterol have been found in part to be derived from acetic acid. Formation of ketone bodies, such as acetoacetic acid, from acetic acid may occur in the kidney and in any tissue which metabolizes acetates and may no longer be considered to be exclusively a function of the liver. After feeding the amino acid glycine containing N^{15} to a man, samples of hemin, the iron-prophyrin compound in hemoglobin, were found to contain the N^{15} , indicating that glycine had been used in the synthesis of the prophyrin portion of the hemin. The average lifetime of a prophyrin molecule was found to be about 100 days, considerably longer than would have been expected from other studies on the lifetime of the red blood cell. The sulphur of methionine, an amino acid, has been shown to be used *in vivo* to form another amino acid, cystine; the carbon chain of methionine was not utilized.

Enzymes.—Phosphorylase, the enzyme which converts glycogen to glucose-1-phosphate has been shown to consist of two enzymes, phosphorylase *a* and *b*. Phosphorylase *a* can be converted to phosphorylase *b* by trypsin or by an enzyme present in muscle. The conversion of phosphorylase *a* to *b* involves splitting of a prosthetic group which contains organic phosphate. Phosphorylase *b* requires adenylic acid for activity whereas phosphorylase *a* shows 65 per cent of its maximal activity in the absence of adenylic acid. The transformation of *a* to *b* is of importance in muscular contraction since it results in a slower rate of glycogen breakdown. Resting muscle contains phosphorylase *a* while stimulated muscle contains mostly phosphorylase *b*. No phosphorylase *a* could be obtained from fatigued muscle.

Ribose-1-phosphate, a nucleoside, has been synthesized *in vitro* with an enzyme from rat liver. The reaction

inosine (hypoxanthine riboside) + excess phosphate \rightleftharpoons hypoxanthine + ribose-1-phosphate is reversible but can be made to go to completion by addition of another enzyme, xanthine oxidase, which converts the hypoxanthine formed to uric acid.

Acetyl phosphate, an important intermediary in the transfer of energy in the cell has also been synthesized enzymatically from pyruvic acid and phosphate using an enzyme from bacteria.

Lysozyme, the enzyme in egg white which dissolves certain bacteria, has been obtained in crystalline form.

Proteins.—A complete quantitative analysis of a protein, lactoglobulin, has been made and it has become possible for the first time to account for every one of its several hundred constituent amino acid residues. The molecular weight

calculated from amino acid analysis was in good agreement with that obtained by ultracentrifugal and diffusion measurements.

The protein hormone of the anterior pituitary gland which is associated with growth has been isolated in purified form. It causes resumption of growth and an increase in the cartilage at the epiphyses of the bones of rats whose pituitaries have been excised. A new class of proteins has been found in fetal serum. These proteins, called fetuins are also present in the newborn but are absent in the adult. They have a molecular weight of about 50,000.

Vitamins.—The antagonistic effects of substances closely related in chemical structure to vitamins and essential metabolites have been extensively studied. Replacement of the sulphur in biotin by an oxygen atom did not impair its growth stimulating effect on three species of yeast. However, thienylalanine, a compound in which the phenyl group of phenylalanine has been replaced by the thiophene ring caused marked inhibition of growth when added to a yeast medium. This inhibition could be prevented by increasing the concentration of phenylalanine. Administration of α -tocopherol quinone, a compound structurally related to vitamin K, caused hemorrhage of the reproductive system of mice and resorbive termination of pregnancy which could be counteracted by vitamin K.

Chemotherapy.—Strains of staphylococci which are resistant to the action of penicillin have been developed. These strains are thought to arise by mutation when organisms are grown in media containing penicillin which acts selectively to eliminate non-resistant organisms. Resistance can be increased by exposure to higher concentrations of penicillin. These studies suggest the possibility that similar mutations may take place in penicillin-treated individuals and that drug-fast strains may become of increasing clinical importance. Penicillin has also been found to produce an increased coagulation time with a non-retractile type of blood clot. Another antibiotic, streptomycin, offers considerable promise in the treatment of typhoid fever and several diseases caused by Gram-negative organisms against which penicillin is ineffective. Two crystalline derivatives of streptomycin have been reported which should be of aid in purification and in elucidation of its structure.

Blood Group Substances.—The Rh factor, that blood group antigen responsible for many cases of fetal death and for occasional severe reactions following multiple transfusions of blood compatible with respect to the A and B factors, has been shown to be present in amniotic fluid. The Rh substance in the fluid appears to be of fetal rather than of maternal origin. Its availability in soluble form should materially facilitate its purification and a study of its properties.

ELVIN A. KABAT,

College of Physicians and Surgeons, Columbia University and the Neurological Institute, New York.

BIOPHYSICS. See under PHYSICS.

BIROBIDZHAN (BIROBIJAN), bē'rō-bī-jān', Jewish Autonomous Region in the Soviet Far East. It is situated in a great bend of the Amur River opposite the northeast corner of Manchuria. Colonization of the region was begun in 1928 by volunteer Jewish settlers, autonomous status being extended in 1934. It has an area of 14,200 square miles, and by 1939 had a population of

108,400, chiefly Jews, but including also Russians, Belorussians, Ukrainians, and Koreans. The capital, Birobidzhan, which is on the Moscow-Vladivostok railway (south branch) was in 1928 a village of 600 inhabitants. By 1941 its population was reported as 38,000, and it had seven large factories, an electric power station and a mechanized bakery. It also had a hospital, a hotel, technical schools, a school of ballet and music, a large library, Jewish newspapers, and a State Jewish Theater.

Farming is a leading occupation of the region, vegetables, fruit, and honey being specialties. Collective farming is rapidly developing, especially along the Amur, while large quantities of timber are cut in the extensive taiga (forest region). Mineral resources are also important. Iron ore deposits estimated at 600,000,000 tons are being developed. Gold mining is in progress at Soutar. Large lime works are in operation at Londoko, and marble is being quarried at Birokan. A health resort has been established at Kuldur. By 1944, 26 artels (handicraft associations) of producers' co-operatives and 9 domestic-industry enterprises were producing consumers' goods, stress being laid during the war upon production of leather, buttons, and laundry soap, and upon the manufacture and repair of household utensils and agricultural hand tools.

BLUM, Leon, French political leader: b. Paris, France, April 9, 1872. In early May 1945, M. Blum, twice premier of France, was freed from German authorities by Allied forces at Dobbiaca, Italy. With Kurt Schuschnigg, former Austrian chancellor, and Rev. Martin Niemöller, German anti-Nazi pastor, he had been moved from Buchenwald, where he had spent two years. M. Blum was arrested in 1940, after the collapse of France, and in 1943 was transferred to a German prison. A brilliant literary and dramatic critic, and leader of the Socialist Party, later of the Popular Front, he entered French national politics in 1919 as a member of the Chamber of Deputies. He was premier of France from June 1936–June 1937, and as such, carried through radical reforms affecting banking, labor and agriculture. He was again premier, March–April 1938. He was educated at the École Normale Supérieure where he took his degree in philosophy. He then studied law at the Paris Law School and became an attorney. For 26 years, he was a member of the highest French tribunal, *Conseil d'Etat*, from which he retired in 1919, with the title *Maitre des Requêtes*, to enter active politics. Since his return to France, M. Blum has resumed his duties as leader of the Socialist Party and political editor of the party organ, *Le Populaire*.

B'NAI B'RITH (SONS OF THE COVENANT). Oldest Jewish service organization, founded in 1843 to further the unity of the Jewish people and to serve humanitarian and community causes through a program encompassing youth welfare, education, community and social service, inter-faith understanding, defense of Jewish rights, philanthropy, Americanism. Membership: 240,000. President: Henry Monsky; secretary: Maurice Bisgyer, headquarters: 1003 K Street N. W., Washington 1, D. C.

From Pearl Harbor to V-J Day, B'nai B'rith compiled a war service record expressed in the

following figures: 527 members killed or missing in action and 502 decorated; 1,500 recreational facilities equipped for the army and navy; 650 fighting ships equipped with recreational material; \$900,000 contributed to the Red Cross and other United Nations relief agencies; \$700,000,000 worth of war bonds sold; 2,500,000 servicemen and women entertained.

B'nai B'rith's president was an official consultant to the American delegation to the United Nations Conference in San Francisco. In memory of Franklin D. Roosevelt, the B'nai B'rith Women created a Four Freedoms Library at the University of Illinois.

BERNARD POSTAL,

National Director of Information, B'nai B'rith.

BOCK, Fedor von, German Army officer; b. Dec. 3, 1880; his bullet-riddled body was found north of Hamburg, Germany, by troops of the British Second Army, May 6, 1945. As a field marshal, von Bock commanded the Central Army Group in the Nazi invasion of Russia in June 1941, and was relieved of his Russian command after German failure to take either Moscow or Stalingrad. He was known as *Der Sterber* (the Dier) because of his reckless expenditure of men and matériel in efforts to attain his military objectives. In 1939, he took part in the Polish campaign, and in 1940, directed operations of the lower Somme army against France. Von Bock was a product of the Potsdam Military School; served in the First World War and emerged a major. From 1920-38, he commanded the German Third Army Group.

BOLIVIA, bô-liv'î-â, Sp. bô-lêv'ê-â. Third largest country of South America, with an estimated area of 506,792 square miles and an estimated population of 3,533,000. Indians number approximately one third of the population. Sucre is the capital, but La Paz (pop. 301,000), situated at an elevation of 12,000 feet above sea level and the highest important city in the world, is the actual seat of government. The language is Spanish; Indians and mestizos speak also Aymará, and Quechua, native languages.

An organic law of Oct. 30, 1938, superseded the constitution of 1880, and provided for a democratic, representative, unitary republic, with executive power vested jointly in the president and a Cabinet appointed by him. The president, elected for four years by direct suffrage, was declared ineligible for re-election until four years after the end of his term. Legislative power was vested in a Congress of two chambers—a senate of 27 members (three from each department) elected by popular suffrage for six years, and a Chamber of Deputies of 70 members elected for four years. Justice is administered by a Supreme Court, district courts, and minor tribunals, the judicial arm being legally independent of both the president and Congress. Gen. Enrique Peñaranda was inaugurated president on April 15, 1940. He was ousted by a coup d'état Dec. 20, 1943, led by Victor Paz Estenssoro and a group of junior army officers who put Maj. Gualberto Villarroel, a hero of the Chaco War, in as president.

Religion.—Roman Catholicism is the state religion, although other forms of worship are permitted. The Roman Church has two archbishops and six bishops. Marriages must be celebrated by civil authorities; divorce (among other than those of the Roman Catholic faith) has been permitted since 1932.

Education.—Under a supreme decree issued in

May 1939, the educational system of Bolivia was unified. Thereafter, education became a government function, with full control from kindergarten through the universities. A National Educational Council was formed to direct educational activities and to bring about uniformity. Provision is made for the study of civics in all schools. Classes, except those for teaching a foreign language, must be held in Spanish. Examinations are controlled by the National Educational Council and are the same in all schools.

The latest statistics showed more than 2,000 primary schools with an enrolment of 155,627 pupils; and 47 secondary schools with an enrolment of 8,396 (1941). There are six universities, located in the following cities: Sucre, La Paz, Cochabamba, Oruro, Potosí and Santa Cruz. Under the direction of the Supreme University Council are also an Institute of Commerce, a School of Mines, and a School of Native Languages. A new feature of the school system is the emphasis on Indian education. There are 16 regional schools with an enrolment of 10,000 children, drawn from a population of 1,500,000 Indians.

In La Paz the principal newspapers are *Ultima Hora*, *La Razon*, *El Diario*, *La Talle* and *La Noche*. Other leading papers are published at Cochabamba, Sucre, Potosí and Oruro.

Army.—Bolivia is divided for defense purposes into 8 military regions and 5 frontier military governorships, all under the direct control of the chief of staff of the army. The law of 1943 provides for a permanent force of 15,000 men, excluding the police force and the frontier carabinieri. Military service is compulsory for all males from the 19th to the 50th year. Those from 19 to 25 serve not more than two years with the standing army; those from 25 to 30, "the ordinary reserve," return sometime for three months' service. After this the men pass to the "extraordinary reserve" for 10 years and complete their service by 10 years' enrolment in the Territorial Guard. The army has the following institutions: Military College, School of Arms, Superior School of War, Military Geographical Institute and Non-commissioned Officers School. In normal times the army consists of 12 infantry regiments, 6 cavalry regiments, 3 regiments of mountain artillery, a field artillery regiment, 6 battalions of engineers, and 1 aviation corps. There are also small infantry bodies (*columnas*) of 100 and 200 men stationed in the larger towns of the departments, and capable of being expanded into battalions in times of emergency. In November 1941 an American Air Mission took over from the Italians the training of the Bolivian air force. At present the army has American army and aviation missions.

Transportation and Communication.—There are 1,867 miles of railroads in operation in Bolivia, of which 506 miles are owned by the government; the principal line is the Antofagasta and Bolivian Railway, total length in Bolivia 744 miles. Main highways total 2,925 miles, exclusive of 3,275 miles of secondary roads and 1,000 miles under construction. The airlines cover 3,495 route miles. Pan American-Grace Airways, Inc., links Bolivia with the United States and with other South American countries, and Lloyd Aéreo Boliviano flies 4,431 scheduled miles weekly. Air services underwent marked expansion in 1944 and 1945. Bolivia has 548 post offices, and 683 telegraph, telephone, and wireless offices. International radio service is furnished by the Cia. Radio Internacional Boliviana, while the government main-

tains domestic radio service for political and private business. A new 8-ton aerial trolley spans the Rio Espiritu Santo on the road between Cochabamba and Todos Santos, facilitating transport between La Paz and the Amazon Basin rubber areas. Direct communication between Arica, Chile, on the Pacific Ocean and Brazilian river ports was made possible with the completion early in 1944 of a section of the Santa Cruz-Corumbá Railway line. Work on the Yacuiba-Santa Cruz Railway was initiated on May 23, 1944. This line will connect Positos, Argentina, a town just south of the Argentine-Bolivian border with Santa Cruz, Bolivia.

Agriculture and Industry.—Potatoes, cacao, coffee, barley, and highland rice are the principal products, but agriculture generally is undeveloped, only about 500,000 acres or approximately one fifth of 1 per cent of the total area being cultivated. Bark and hides are extensively produced, and the country ranks as the second rubber-exporting country of South America (next to Brazil). The last livestock census reported 1,854,915 cattle, 5,552,074 sheep, 747,581 goats, 1,882,000 llamas and alpacas, 335,580 swine, 375,738 horses and mules.

New cement factories in 1944 greatly increased the annual output of 23,000 tons, exceeding domestic consumption.

Tobacco manufactures in La Paz are valued at more than \$1,000,000 annually. There are also cotton mills, a glass factory and new paint and paper products factories in La Paz.

Bolivia's national fish hatchery at Pongo was completed in 1944: By stocking Bolivia's rivers and lakes from the new hatchery it is hoped that the country will become self-sufficient in this important food item. Production of crude petroleum during the first quarter of 1945 totaled 12,032,896 liters. Of this amount 6,516,327 liters were processed at the Camiri and Sanandita refineries into gasoline, fuel oil, Diesel oil and kerosene.

The entire annual commercial output of cotton is estimated at only 120,000 pounds, while the domestic cotton mills require about 4,000,000 pounds annually. During 1944, 2,257,657 kilograms of cotton were imported.

More than half of the 1945 municipal budget of 94,000,000 bolivianos for La Paz is earmarked for public works.

Mining.—Tin forms about 80 per cent of the total export values of the republic. Tin production in 1943 was 40,312 long tons, a 5 per cent increase over the amount produced in 1942. About 50 per cent of the tin formerly went to Great Britain, and the rest to the new tin smelter at Texas City, Texas. Recently, larger quantities have been going to the United States. In 1945 a contract was signed between the United States Commercial Company, representing the United States government, and the Bolivian government, together with leading tin producers (except the Patiño interests), covering deliveries from July 1, 1945, to June 30, 1946. It provided for successive reductions in prices from that of the preceding contract. The price for the quarter ending Sept. 30, 1945, remained the same, and was based on 63½ cents per pound for refined tin in the United States. But for the three succeeding quarters it was reduced to 62 cents, 60½ cents and 58½ cents, respectively. Half of the Patiño tin production for 1945 was purchased by the United States. Discussions are being held regarding a similar purchase in 1946.

Moderate increases have occurred in the output of tungsten (estimated at 3,601 metric tons

for 1943), antimony, lead and copper. In September 1945 uranium deposits were reported discovered at Colquechaca.

Foreign Trade.—In May 1945 the exports of tin, most important in value of export items, amounted to 1,983,132 kilograms valued at \$2,830,885; approximately 59 per cent went to the United States. In the same month 1,226,435 kgm. of zinc and 444,981 kgm. of copper, valued respectively at \$168,915 and \$115,267 were exported, all to the United States. Nearly all the silver export of May, amounting to 13,597 kgm. valued at \$191,725, also went to the United States. Rubber exports to the United States during the first half of 1945 totaled 1,968,434 kgm., including 1,645,655 kgm. of fine, and 322,779 kgm. of ordinary rubber. Of the shipments made in June, 92.13 per cent of all fine rubber and 99.41 per cent of all ordinary rubber were routed to the United States. During the first six months of 1945, 160,731 kilograms of cattle hides were exported to the United States; during 1944 the monthly exports of hides to the United States averaged 16,164 kgm.

Finances.—The budget for 1945 balanced with revenues of 252,907,800 bolivianos (1 boliviano = \$0.238) and expenditures of an equal amount. The chief items of expenditure were for education, public works, labor and social works, and agriculture. The most recent official figures for the public debt are those of December 1942 when they amounted to \$60,733,010.81 with interest of \$52,407,600, making a total, including principal and interest, of \$113,140,610.81. The Ministry of Finance is studying ways and means of redeeming these loans in the near future. For the year 1944 there was a national budget surplus of 71,526,362 bolivianos (\$1,703,009 in United States currency).

Principal Events.—The revolution of Dec. 20, 1943 originated, according to its protagonists, in the reaction of the Bolivian people to the conservative and arbitrary policy of the government of Gen. Enrique Peñaranda. This government, they assert, pursued a reactionary policy functioning in the interests of a minority group consisting of the mining oligarchy, and hence was absolutely opposed to the rights and essential needs of the majority of the people. Its policy, aggravated by administrative corruption, led to a crisis when it resorted to armed repression to silence the demands of the mine workers of the Patiño Mining Company who demanded better living conditions. The government's answer to the demands was the massacre of Catavi in which a hundred men, women and children were killed.

The Catavi tragedy, which occurred in December 1942, not only infuriated the Bolivian people, but had repercussions in other American republics. Upon the subsequent visit of President Peñaranda to the United States, Ernesto Galarza, chief of the Labor Office of the Pan American Union, addressed an open letter to Acting Secretary of State Sumner Welles denouncing the crimes committed against the Bolivian workers. Synchronously in the Bolivian parliament the MNR (*Movimiento Nacionalista Revolucionario*), a left party which had, however, no international influences or affiliations, began an energetic campaign against the government. This resulted in the rise of a united revolutionary sentiment among the exploited working classes. The younger army officers joined the movement.

Such is the background of the Revolution of December 20 which, according to its sponsors, at no time had any foreign support or the slightest contact with nazism or fascism. The errone-

ous belief in a connection of the MNR with these European ideologies, continuing for a long time after the revolution, was based, said the revolutionaries, on the fact that the Peñaranda government, democratic in appearance but dictatorial in fact, branded all its political enemies as Nazis. This together with the campaign of slander unleashed by the expelled members of the Peñaranda government, confused continental opinion to the point of denying recognition to the new revolutionary government suspected of having the backing of pro-Nazi elements. Proof of the loyalty of the new government to the ideals and objectives of the United Nations effectually dissipated these suspicions.

On May 11, 1944, Avra M. Warren, United States Ambassador to Panama, and Gen. Ralph Wooten, commander of the Sixth United States Air Force, arrived at La Paz to study the political situation. Their report favoring United States recognition was the basis for consultation with other American republics. Accordingly, on June 23 the Bolivian government, which had been previously recognized by Argentina, resumed its relations with its sister Latin American republics and Great Britain.

The elections of July 2 gave majority control in Congress to the MNR, while the Democratic Union (*Unión Democrática*), which included the four "traditional" parties and the leftist PIR (*Partido de la Izquierda Revolucionaria*), obtained a total of only 21 seats. Thus the popular vote confirmed public support of the forces that had achieved the revolution.

In August 1944, Lieut. Col. Gualberto Villarroel, president of the government council, was elected constitutional president of the republic by the National Assembly for the term of 1944 to 1948.

The new government has instituted a series of radical reforms with these objectives: (1) to integrate the Indian masses into the national social and economic life; (2) to establish subsistence wages and a higher standard of living for the rural and laboring classes; (3) enactment of laws to benefit the middle classes; (4) control of the national wealth, hitherto monopolized by three great mining corporations; (5) a program of diversification of production, in order to create new sources of wealth and change the national economy, so that tin will no longer be the primary source of fiscal income; (6) reform the national constitution to make it responsive to the needs of a developing nation.

BONG, Richard Ira, United States Army Air Force officer: b. near Poplar, Wis., 1921?; d. in a crash while testing a jet-propelled fighter plane, Burbank, Calif., Aug. 6, 1945. America's greatest air ace, Major Bong had shot down 40 Japanese planes and flown over 500 combat missions against the enemy. He had received 26 decorations, including the nation's highest award, the Congressional Medal of Honor.

A student at the Wisconsin State Teachers College in Superior, Wis., Major Bong had completed a Civil Aeronautics Administration training course when he enlisted in the Army Air Forces in September 1941. He won his wings at Lipe Field, Phoenix, Ariz., in January 1942, and in September of that year was sent to the southwest Pacific with the 5th Fighter Command. During two years of combat in the Pacific, he fought through the battles of the Bismarck Sea, Oro Bay, Buna, Wewak, Lae, Rabaul, Huon Gulf, and Leyte. His first victory was on Dec.

27, 1942, when he shot down an enemy Zero fighter and a bomber. He became the leading ace of the United States in April 1944, after shooting down his 27th Japanese plane over Hollandia, New Guinea. This record surpassed the score of 26 achieved in the First World War by Capt. Eddie Rickenbacker. Gen. Douglas MacArthur personally presented to him the Congressional Medal of Honor on Dec. 12, 1944, and five days later he gained his 40th air victory over Mindoro in the Philippines. Major Bong returned from the Pacific in January 1945 and was assigned to test flying at the Lockheed aircraft plant in Burbank. Among his decorations were the Distinguished Flying Cross, the Air Medal with 17 Oak Clusters, the Distinguished Service Cross, and the Silver Star Medal.

BONNET, Henri, French diplomat: b. Châteauponsac, Department of Haute-Vienne, France, May 26, 1888. M. Bonnet was appointed ambassador to the United States in late November 1944 by Gen. Charles de Gaulle. On New Year's Day 1945, he signed in Washington the joint statement by which France became a member of the United Nations. An honor graduate of l'École Normale Supérieure, M. Bonnet specialized in the study of history and foreign relations after the First World War. In 1919, he edited the Paris *L'Ère Nouvelle*. In 1920, his knowledge of foreign affairs secured him a post in the newly created League of Nations, and between 1920 and 1931, he attended League conferences in Europe, Asia, and America. In the latter year, he became director of the International Institute of Intellectual Co-operation, and held that position until 1940. After the fall of France, he and his wife, the former Helle Aghnaides, went to the United States, following a brief sojourn in London where Bonnet was active in the Free French movement. Thereafter, he became a member of the faculty of the Free School for Higher Studies; served on the Council of the Free World Association; and was special adviser to the World Citizen's Association (Chicago), under whose sponsorship he wrote or edited a number of books. Included among them are the following: *The World's Destiny and the United States*; *The United Nations, What They Are, What They May Become* (1942); *United Nations On the Way: Principles and Policies* (1942); and *Outlines of the Future* (1943), in which he supports General de Gaulle's opposition to European spheres of influence. In June 1943, M. Bonnet left the United States for Algiers to assume his duties as information chief for the French Committee of National Liberation. He resigned this position shortly after the establishment in Paris of the Provisional Government of the French Republic, Aug. 30, 1944, contending that "most key government posts should be held by active members of the Resistance."

BORNEO, East Indies. The third largest island in the world, exceeded in size only by Greenland and New Guinea. The area is 296,726 square miles, and the population is estimated to be 3,139,585. Nearly three quarters of the island is, politically, part of the Netherlands Indies (q.v.), the remainder comprising three states, on the north and west of the island, under British protection; Labuan, a small island off the northwest coast, is, politically, part of the Straits Settlements (see *BRITISH MALAYA*). The governor of the Straits Settlements is also high commissioner for Brunei, and British agent for the states of North Borneo and Sarawak. The

areas and estimated populations of the components of the island of Borneo are as follows:

Territory	Square miles	Population	Capital
British North Borneo	29,500	304,000	Sandakan (13,826)
Brunei	2,226	39,000	Brunei (12,000)
Netherlands Borneo	215,000	2,306,000	Bandjermasin (64,223)
Sarawak	50,000	490,585	Kuching (30,000)
Total	296,726	3,139,585	

British North Borneo.—Officially styled 'The State of North Borneo, it is under the jurisdiction of the British North Borneo (Chartered) Company, the only body still holding a charter from the British crown to carry on the government of a country under British protection. Administration is conducted by a governor (appointed with approval of the British government), who is assisted by a nominated Legislative Council of 14 (9 official and 5 unofficial members) and some 60 white officials. Between 1900 and 1940 the annual revenue of the government increased from £62,000 to £503,436; expenditure in 1940 was £249,138. Most of the people are pagan; by 1939 there were 49 state-aided mission schools with an average daily attendance of 3,270. There were also 79 unaided Chinese vernacular schools with about 4,500 pupils; and the government maintained 21 Malay vernacular schools. The Malay language is the lingua franca of the country. Chinese form the commercial community and are also market gardeners. Rice and sago are staples of native diet, and tapioca, peanuts, and sweet potatoes are cultivated. Rubber plantations were, prior to the war, the principal economic asset of the country. In 1940, 176,000 tons of rubber were produced on 126,400 acres, half of it on small holdings. Coconuts occupy 53,000 acres, and manila hemp 5,296; tobacco-growing has declined in importance. Petroleum deposits have been located at Lahad Datu and Tawau; they await development, as do such known mineral resources as gold, manganese, platinum, and tin. Exports in 1940 totaled \$820,270,502 (the Straits Settlements dollar in 1940 averaging \$0.46979 in United States currency). Rubber exports constituted 71.2 per cent of the total value; other exports were timber, cutch (bark of the mangrove tree, used in dyeing), copra and coconuts, dried and salt fish, tapioca, manila hemp, rosin, and sago. Imports in 1940 totaled \$9,978,419, represented mainly by foodstuffs. From Sandakan, principal east coast seaport, there were scheduled steamship services to Hong Kong; and from Jesselton, port on the west coast, weekly steamers to Labuan, Singapore, and Sarawak. A government railroad of 127 miles ran southward from Jesselton to Beaufort, and thence eastward to Melalap; a branch line connected Beaufort with Weston, on Brunei Bay. Outside municipal limits there were 236 miles of highways, and 600 miles of bridle paths.

Brunei.—A sultanate under British protection. While supreme authority is vested in the sultan (Ahmed Tajudin Akhazul Khairi Waddin succeeded in 1925) and a council of 9 members, administration is in the hands of a British resident (a member of the council) and white officials, all of them members of the civil service of British Malaya. Revenue in 1940 amounted to £181,574, and expenditure was £170,587. The government provides free vernacular education in Malay (23 schools in 1940, with 1,708 pupils); there are also 5 Chinese vernacular

schools (472 pupils) and 4 private English schools (160 pupils). The natives cultivate rice and sago, though fishing is their main occupation. Some obtain jelutong rubber in the forests (otherwise unexploited), and others are employed on plantations of hevea rubber, exports of which amount to one fifth of the total (£1,122,680 in 1940). Brunei is one of the largest producers of petroleum in the British Bornean territories, representing some 70 per cent of the sultanate's total exports (5,732,559 tons of crude petroleum in 1940). The British Malayan Petroleum Company, which operates at Seria, on the coast, sends its oil to be refined at Lutong, on the Miri River, in the neighboring Sarawak field. Total imports were valued at £453,502. Brunei has 87 miles of highways, rivers and the sea affording the principal means of communication.

Netherlands Borneo.—See article NETHERLANDS INDIES.

Sarawak.—Administered under British protection, by a white rajah (Sir Charles Vyner Brooke succeeded in 1917), assisted by a Supreme Council of 7 (5 Malayan chiefs and 2 white officials). Government revenue in 1940 amounted to \$7,463,315, and expenditure was \$5,018,007; there was no public debt, and assets exceeded liabilities by \$10,390,476. The majority of the indigenous inhabitants are Dyaks, while there are considerable numbers of Malays, Chinese, and other migrants. Vernacular schools are conducted by missions with the aid of government grants. About 300,000 acres of land were planted in rubber; except for some 10,000 acres under white management, all of it was in small native holdings of about three acres each. Chinese landowners cultivate pepper on a considerable scale, and the sago palm yielded a flour which was exported to Malaya. Gold and coal have long been mined, and petroleum is obtained from fields at Miri, at the northern end of the country, by Sarawak Oilfields, Limited, and refined at Lutong; production in 1940 amounted to 1,314,000 barrels. Exports of rubber that same year totaled 35,000 tons. The total value of all exports in 1940 was \$45,770,407; and imports, principally rice and other foodstuffs, amounted to \$32,645,192. Kuching, the capital, and Miri have direct steamship communication with Singapore. Internal communication is mainly along the rivers; there are about 500 miles of roads, about one fourth of the total length being usable by automobiles throughout the year.

Principal Events in 1945.—The British-protected territories in the north and west of Borneo were occupied by the Japanese in December 1941, and it was not until 1945 that operations for their recovery could be undertaken. On June 8, after initial sea and air bombardment, landings were effected on the island of Labuan by the Australian 9th Division. Within a week all Japanese resistance had been overcome on Labuan and also in Brunei, and the Australians continued southward on the mainland to capture the Miri oilfields of Sarawak by June 21. Also moving northward from the Brunei Bay area into British North Borneo, the Australians captured Beaufort on June 26 and went on to seize Kimanis, 21 miles northeast of that town, on July 13. Meanwhile, and continuing until the close of hostilities, air raids were made on Japanese bases at Jesselton, to the north, and at Kuching, lying far to the southward. All Japanese forces in Borneo were included in the capitulation to Admiral Lord Louis Mountbatten at Singapore on Sept. 12, 1945, signed on behalf of Field Marshal

Count Juichi Terauchi, commander in chief of all the Japanese Southern Armies, by Lieut. Gen. Seishiro Itagaki. A local surrender of enemy troops in North Borneo and Sarawak was completed on September 14, when Maj. Gen. Katsuo Otsuka, commanding in the Sandakan area, signed the necessary documents before Australian representatives. An appalling story of cruelty then came to light, the Australian government reporting that only six men out of 2,550 British and Australian prisoners of war survived captivity at Sandakan; practically all those who survived disease and death marches through the rugged Borneo mountains in January 1945 were killed in cold blood by their captors.

WHEELER B. PRESTON,
Author and Publicist.

BORNHOLM, Denmark. An island in the Baltic Sea, 22 miles southeast of Sweden. It is 24 miles long and 19 miles in breadth; the area is 227 square miles, and the population amounts to 46,542. The capital and principal seaport is Rønne, on the west coast; it is connected by rail (22 miles) with Neksö, a southeastern port. Flax, hemp, and oats are cultivated, and other industries include fishing and the manufacture of pottery.

On May 9, 1945, the day following unconditional surrender of the German armies, Russian troops were landed on Bornholm with the prior knowledge and approval of Gen. Dwight D. Eisenhower. Their commander issued a statement to the effect that the island was being occupied by Russian forces provisionally until questions of Germany relating to the war were solved. Nevertheless, Soviet troops had not been withdrawn by the year's end. It was reported that Bornholm had been used by the Germans for their researches into atomic energy.

BOSE, *Subhas Chandra*, Hindu politician, author, and journalist: b. Cuttack, Bengal, India, 1897; d. after an airplane crash near Taihoku, Formosa, Aug. 19, 1945, according to a Tokyo radio report. The only prominent Indian nationalist leader to be won over by the Axis, Bose headed the Japanese-sponsored provisional government of Free India. A high-caste Hindu, though not a Brahman, Bose attended the Presidency College of Calcutta and then went to England to study at Scottish Church College and Fitzwilliam Hall, Cambridge. He entered the Indian Civil Service in 1920, but the next year he came under the influence of Gandhi's civil disobedience campaign, resigned his position, and joined the Swaraj Party. From then on his career alternated between public work as a Congressman and periods spent in jail. In 1927 he was elected president of the Bengal National Congress and general secretary to the All-India National Congress. Together with Nehru he founded the Indian Independence League in 1928. From 1929 to 1931 he was president of the All-India Trade Union Congress, and during 1930 was elected mayor of Calcutta while serving a jail term in Burma. Representing an extreme Left-wing position, Bose was violently anti-British and demanded complete independence for India. In contrast with Gandhi, he became a defender of the use of force as the only way to win this independence. While living in Vienna in 1932, he began to advocate *Samyavada* (equality) — a single-party state with authoritarian discipline. At this time he was on friendly terms with Mussolini and prominent Nazi officials. Bose was elected president of the Indian National Con-

gress in February 1938 and he and other Left-wing members denounced what they considered Gandhi's conservative and compromising policies. Despite Gandhi's opposition, he was re-elected by a narrow margin the next year, but resigned that spring after unsuccessful negotiations with Gandhi over matters concerning the party's working committee. On July 2, 1940, he was arrested on the charge of plotting to raze the famous Black Hole Monument in Calcutta. Released in December after a hunger strike, he disappeared in January 1941, and late that year turned up in Germany, where he is said to have conferred with Hitler. By June 1943 he was reported in Tokyo and from there went to Singapore to proclaim the establishment of his counter government in October 1943 and to announce the formation of an army of liberation to be recruited among Indians in Japanese-dominated territory. In January 1944, he moved his headquarters to Burma, but after the Japanese rout in that area, he transferred to Bangkok, Siam. At the time of his death, Bose was still held in esteem by many young Indian nationalists. His autobiography, *The Indian Struggle, 1920-34*, was published in England in 1935, but banned in India.

BOSNIA-HERZEGOVINA. Former territory of Austria-Hungary; afterwards included in Yugoslavia (q.v.).

BOTANY. The number of reports on research from abroad is beginning to increase in botanical periodicals. Many lines of research were discontinued or reduced during the war while others were greatly stimulated. Guayule has been thoroughly investigated in connection with its cultivation as a source of natural rubber. The following titles from recent issues of the leading botanical journals will give an idea as to the nature and extent of this work. "Growth, Rubber Storage, and Seed Production by Guayule as Affected by Boron Supply"; "Toxic Substances from the Culture Media of Guayule Which May Inhibit Growth"; "Some Anatomical Effects of Moisture Stress in Nursery Seedlings of Guayule"; "Effect of Light Intensity and Nutrient Supply on Growth, Production of Rubber and Seeds of Guayule"; "Winter Hardiness in Guayule; Rubber Content, Stem Anatomy, and Seed Production as Related to Rate of Vegetative Growth in Guayule." These papers have appeared in volume 106 of the *Botanical Gazette* for 1944-45. In other journals one finds: "A Root Rot of Guayule Caused by *Pythium ultimum*" (*Phytopathology* 35: 636, 1945); "Renewal of Growth by Guayule Transplants" (*Plant Physiology* 20: 137, 1945); "Fertilization Without Reduction in Guayule (*Parthenium argentatum* Gray) and a Hypothesis as to the Evolution of Apomixis and Polyploidy" (*Genetics* 30: 323, 1945); "Apomixis in Guayule" (*Proceedings of the National Academy of Science* 30: 352, 1944); "The Anatomy of Leaf Abscission and Experimental Defoliation in Guayule" (*American Journal of Botany* 32: 250, 1945); "A Differential Stain for Rubber in Guayule" (*Stain Technology* 19: 103, 1944) and "Some Staining Techniques for Guayule Studies" (*Stain Technology* 20: 37, 1945).

Ecology.—Bombed cities in England are proving to be excellent centers for studying plant dispersal. Over 100 species have invaded ground which heretofore had been the site of buildings for centuries. Since there is little prospect that buried seeds are able to germinate at this date, these species represent new arrivals from the

outside. The yellow flowers of coltsfoot and the tall purple spires of fireweed are very frequent; also the ubiquitous dandelion. It is significant that these three plants have seeds or fruits equipped with hairs allowing for wind dispersal. Species with adhesive seeds when wet, as those of chickweed, plantains and shepherd's purse are common where pedestrians congregate. The microscopic spores of mosses and ferns are readily carried by air currents and as a consequence the bracken fern and various mosses are appearing in the naves of bombed churches. Clovers, alfalfa, meadow-grasses, oats and wheat have escaped from the nose-bags of horses and are thriving along streets and in nearby open ground. All information on seed dispersal and invasion of new areas is of value to ecologists in solving problems in plant distribution.

Much as clear cutting in lumbering has been decried in the past, there are some forests which must be clear cut if they are to replace themselves. Chapman (*Ecology* 26: 274-282, 1945) in studying reforestation with the loblolly pine (*Pinus taeda*) of the Southern states, has found that this pine does not establish itself if the competing hardwoods (oaks, gums, etc.) get a two to three year start on it. The pines grow very slowly in shade and are either destroyed by fire or drought. Reforestation with this valuable species is accomplished by clear cutting followed by killing the hardwood sprouts by winter fires. If fires can be excluded for 6 to 10 years after the pine seeds have germinated, an almost pure stand is assured.

Dyksterhuis (*Ecology* 26: 195-199, 1945) has discovered that a somewhat unique method of reproduction in Texas needle grass is responsible for its growth under very unfavorable conditions. In addition to the usual type of grass flower, a second kind is borne in the leaf-axils beneath the soil. These flowers do not open, but through self pollination develop viable seed. Needle grass is a perennial except under severe grazing or drought when it dies in summer. Heavily grazed plants do not have a chance to bear seeds from the aerial flowers. The subterranean seeds, however, are produced freely in April, and since they are protected against both grazing and fire, germinate in the autumn. Thus, the plant behaves as an annual. Texas needle grass is considered to be the most important grass in the eastern half of Texas.

Photoperiodicity.—Many plants require a definite photoperiod, i.e. a specific length of day in order to flower and set fruit. The tomato, when subjected to properly controlled temperature, is practically indifferent to the daily length of illumination. According to Went (*Science* 101: 97-98, 1945), a warm day temperature of 26° C. and a cool night temperature of 15-18° C. is best for growth and set of fruit. The cool period is most effective in darkness or in greatly reduced light. Fruit is not set if the plants are subjected to the proper temperature sequence in light.

If fruits are to be obtained, the night-range of temperature must not be above 22° or below 10° C. even though the day range is favorable for growth (15-35° C.). Therefore, tomatoes do not bear fruit in southern California in winter or spring, where the night temperatures are usually below 10° C. and the afternoon temperatures are between 15-20° C. Set of fruit could be expected under these conditions only if part of the afternoon could be converted into a functional night. This was accomplished by the

simple expedient of covering the plants with tar paper from 3:00 P.M. until between 7:00 to 8:00 the next morning. Food manufacture was not hindered because the tomato makes its maximum of daily sugar by early afternoon. The first fruits were harvested on April 1, 1944 while noncovered controls did not fruit at all. This experiment conclusively shows that processes occurring at between 15-20° C. in darkness regulate the development of the tomato.

The importance of a dark period is further illustrated by some work on Biloxi soybeans (Parker et al, *Science*: 102, 152-155, 1945). Flower buds are produced if the entire plant or only a single leaflet is subjected to a minimum dark period of 10.5 hours for two or more daily cycles. This dark period must be continuous, an interruption as short as 30 seconds with about 15 foot candles of light will inhibit the production of flower buds. It would seem that the energy absorbed by the chlorophyll is transferred to a reaction which causes the destruction of the material required for initiation of flower buds.

Plant Hormones.—Chemical compounds, known as growth substances or hormones, are being extensively employed by physiologists in studying growth and differentiation in plants. Green tomatoes (Judkins, *American Journal of Botany*, 32: 242-249, 1945) are an excellent source of auxin, an important plant hormone. Fruits from actively growing plants have a higher yield than from slow growing ones at the end of the season. The green tissue is dried rapidly on wires at 160°-180° C., after which it is extracted in water at pH 11.8 for 18 hours at 26° C. Yields higher than previously reported in the literature were secured by this method. Auxin stimulates root production, inhibits the growth of lateral buds and may stimulate cell elongation. It collects on the shaded side of stems and petioles causing the cells to elongate. Unequal growth results and the stem or leaf is turned toward the light.

Several growth substances or factors may be necessary to stimulate growth of an organ. Van Overbeek and Gregory (*American Journal of Botany* 32: 336-341, 1945) report that many economically important woody plants in the tropics such as avocado, cinchona, hevea and mango, root with difficulty. They have discovered a technique for rooting the woody white hibiscus, *Ruth Wilcox*, which may be used with other woody species. Formerly the white hibiscus was propagated by grafting onto a red flowered species. Abundant rooting may be secured on the white stock if a small leafy twig is grafted on the apex of the cutting. Significantly enough, roots are not formed when the leaves are removed from the red twig. Further proof that a substance passes from the leaves of the red species into the white cutting is secured by girdling it immediately below the graft. When this is done, the cutting fails to root. Auxin must be supplied in all cases for successful rooting. Botanists generally have difficulty in determining whether failure to root is due to a deficiency in growth factor or factors or to the structure of the tissues involved. It is clear that in the white hibiscus two growth factors are necessary—auxin and a substance manufactured in the leaf of the red species. Attempts are being made to isolate the factor from the red hibiscus. Further surveys of the genera in which important but difficult to root woody plants occur, may reveal closely related species which root easily. In such cases the technique employed for propagating the white hibiscus might prove to be successful.

Mention has been made in these columns of applying sprays containing the growth substance, naphthaleneacetic acid, to delay the autumn drop of apples. Superior results may now be secured with 2,4 dichlorophenoxyacetic acid. The effective period is almost double that from naphthaleneacetic acid. In one experiment at Beltsville, Md., apples treated with 2,4 dichlorophenoxyacetic acid were firmly attached to the tree on October 30, while those sprayed with naphthaleneacetic acid dropped at the slightest touch.

Colchicine, the alkaloid used extensively by plant breeders in doubling chromosome numbers, accelerates the germination of mungo bean, corn, cabbage, rice and wheat, in relatively low concentration (10^{-5} M.). An 0.4 per cent aqueous solution when applied to seedlings of 4 species of oak, two species and one hybrid of chestnut and three hybrids of hazelnut or filbert gave double the growth from untreated controls. The solution was applied directly to the apical tip of the seedlings, one drop per day from 4 to 20 days.

Pathology.—The high esteem with which the American elm is held makes the discovery of a new disease of this tree a concern to all. According to Swingle (*American Forests* 51: 334–335, 1945) elms are dying by the hundreds of thousands in the middle and lower Ohio valley from a virus which attacks the inner bark (phloem). Columbus, Ohio, with 80,000 elms lost 15,000 from 1941–43 and 10,000 in 1944, while 20,000 were killed in Dayton, Ohio, last year. The leaves, in two to four months, change progressively from green to pale green to yellow green, to yellow and are then shed. Progressive dying also occurs in the roots. The inner bark becomes yellow to “butterscotch” color and may be flecked with brown or black accompanied by a faint odor of wintergreen. Infected trees so far are not known to recover. The agent for disseminating the virus is unknown; however, insects are suspected. The problem is being investigated co-operatively by the Bureau of Plant Industry, Soils and Agricultural Engineering and the Bureau of Entomology and Plant Quarantine, Agricultural Research Administration.

Genetics.—The plant breeders of the Connecticut Agricultural Experiment Station have developed two new varieties of sweet corn. One is exceedingly early and the other very late. According to the station, it will now be possible to plant six varieties of sweet corn at one time and have mature corn throughout the season.

Another boon to gardeners is a variety of lettuce, valuable for summer use because it does not shoot up a flower stalk. The leaves are light green with a much wrinkled surface. The production of seed in lettuce is known as bolting in the language of the gardener. Since the new lettuce is slow in doing this, it has been named “Slobolt.”

Green shoulder, so frequently seen in tomato fruits, is an inherited character according to Brown and Scott (*Journal of Heredity* 36: 169–172, 1945). It is determined by the presence of two genes in the dominant condition. A new variety, Uniform Globe, has been produced by selecting plants which have these genes in the recessive condition. The fruits are uniformly smooth and uniformly colored. Green shoulder may be intensified by unfavorable growing conditions.

The potato, for nearly two centuries, has been intimately associated with the prosperity of tem-

perate countries throughout the world. In economic importance the potato is second only to the cereals. The Russians, before embarking on a potato breeding program, began in 1925 to collect all the known and unknown species throughout the world. Some 220 species are known today. Wild species to the count of 200 grow in cold Alpine regions, deserts and tropical forests from the southwestern United States, through Central America and southward into Chile. Hawkes in a recent paper (*Empire Journal of Experimental Agriculture* 13: 11–40, 1945) has summarized the value of indigenous American potatoes in plant breeding. By crossing a wild species which is frost resistant to -10° C. new varieties may be had for the far north. Certain of the Andean species appear to be ideal parents from which to develop commercial varieties for continuous cropping in the tropics or at least two crops each season. Such varieties are urgently needed in India. Resistance to blight, cause of the disastrous potato famine in Ireland of 1845, has been secured by crosses with a wild species, *Solanum demissum*, from Mexico. A survey of the wild species shows that prospects are good for making crosses which should be resistant to virus diseases, to Colorado potato beetle, perhaps even to flea beetle and at the same time increase both protein and starch content. The breeding program will involve many generations—unfortunately most of the wild species carry undesirable characteristics beside the desirable ones, which must be eliminated by painstaking selection. Many new and improved varieties are about to be introduced. If the geneticists can incorporate all the desirable characters from the wild species into a few hybrids, the work of the potato breeder of the future will be greatly simplified.

Antibiotics.—The discovery of penicillin and its antibacterial properties has led many investigators to seek similar substances in other members of the plant kingdom. Waksman, of Rutgers University, has isolated a new antibiotic, streptomycin from *Actinomyces griseus*. Williams and Harris of the Department of Botany, Oxford University, have tested 700 species of the higher fungi (larger Basidiomycetes) and found 20 to be strongly active and 100 weakly active against the test bacteria, *Staphylococcus aureus* and/or *Bacterium coli*. A survey of 400 fungi, including 200 wood destroying species, was made recently at the New York Botanical Garden by Robbins and his co-workers. Antibacterial activity was secured from 200 species. None gave results equal to that of penicillin. The lichens, representing a symbiotic association of a fungus and an alga, have received their share of attention. Antibiotic substances have been reported in 52 species from about 100 species tested at Yale University by Burkholder and Evans. Investigations on the flowering plants have revealed that buttercup juice has strong antibiotic properties (Seegal and Holden, *Science* 101: 413–414, 1945). Cultures of gram positive and gram negative bacteria were inhibited. Favorable action was obtained against three species of yeast—two of which are potential human pathogens.

Lycopersicon, a substance inhibiting growth of *Fusarium*—the cause of tomato wilt—has recently been isolated from the tomato by Irving, Fontaine and Doolittle (*Science* 102: 9–11, 1945). Heinz and Andrus by an ingenious method have shown that resistance to *Fusarium* wilt in the Pan America tomato is localized in the root system. Pan America scions were com-

pletely susceptible when grafted upon Bonny Best root systems which are highly susceptible. However, Bonny Best scions were 90 per cent free from infection when grafted on Pan America root systems. Antibiotic substances probably occur in all organisms, at least the evidence to date indicates that they are wide spread in the plant kingdom. They undoubtedly play an important role in maintaining life against the inroads of parasitic bacteria and fungi.

The use of penicillin has been extended to the treatment of plant disease. Brown and Boyle wrapped galls produced by the crown-gall organism, *Agrobacterium tumefaciens* in penicillin-soaked cotton. After puncturing the galls in numerous places, their complete destruction followed with little injury to the normal tissues. The crown-gall organism is gram negative. In general, gram negative organisms have been reported as relatively resistant to penicillin. Crown gall is especially destructive in the Southwest. The galls generally develop in fruit trees where the graft was made. It may be possible to use penicillin in nursery practices.

Weeds and Herbicides.—Man, since his earliest experiments in agriculture, has been plagued with the problem of freeing his land of weeds. The natural balance between native plants is upset by agricultural practices and new areas are opened for aggressive colonizers, which immediately, and often disastrously, compete with the crop plants. Any unwanted plant is a weed and according to M. A. McCall (*Journal of the American Society of Agronomy* 37: 378-386, 1945), 2,000,000 acres of good farm land in the United States is out of production because of noxious weeds. They need to be controlled in 300,000,000 acres of farm rotation and permanent pastures; also along railroad right of ways, highways and public lands. Weeds, however, are not confined to the land; many are aquatic and thrive in streams, lakes, dam sites, fish hatcheries and reservoirs. These are often very detrimental and must be eliminated at considerable expense. The United States Bureau of Reclamation spends more than \$100,000 annually dragging such unwelcome growth from irrigation canals and drainage ditches. The office of the chief of engineers (U. S. Army) expends nearly \$250,000 yearly clearing the beautiful water hyacinth, so highly prized in lily pools, from navigation channels in the streams of Louisiana and Florida.

A variety of chemicals, known as herbicides, when properly applied are effective in weed eradication. Sometimes unfortunate results are obtained as Dr. John T. Middleton of the California Experiment Station at Riverside has recently reported. Certain fields of tomatoes appeared to be infected with a kind of mosaic. The leaves were mottled and the fruits were few and small. The disease, however, could not be inoculated into healthy plants as would be the case in a true mosaic. A check on the cultural history of the fields revealed that sodium chlorate had been used previously to kill bindweed. Effects were noted in applications made five years before the tomatoes were planted.

A new approach in devising herbicides has been taken by P. C. Marth and J. W. Mitchell (*Botanical Gazette* 106:224-232, 1944) in using applications of certain "growth substances" in toxic concentrations; 2-4 dichlorophenoxyacetic acid at the rate of 100 to 250 parts per million in aqueous spray is a differential herbicide. Dandelion, narrow-leaf plantain, Dutch white clover, chickweed, pigweed, woodsorrel, knotweed,

broad-leaf dock, bindweed and shining pennywort are killed while broad-leaf plantain, sheep sorrel, daisy, yarrow and various species of *Rubus* are not affected. Two applications of 500 to 1,000 parts per million gave no apparent injury to Kentucky blue grass sod. The amounts of the "growth substance" are so small that after-effects are not anticipated on subsequent crops; at least, other investigators have shown that twelve species of cereals, lawn and pasture grasses, germinated and grew normally in soils sprayed two months previously.

There are possibilities that chemical treatments of large areas of ragweed can aid in solving the pollen problem for hayfever sufferers. Where the plants are valuable in reducing soil erosion, the spray can be employed immediately before flowering to reduce the pollen discharged into the air. Penta-chlor-phenol and di-nitro-secondary-butyl-phenol give good results and 2-4-dichlorophenoxyacetic acid is being tried.

Spectacular results have been obtained with flame throwers in the battle against weeds. A machine, traveling at a rate of from 5 to 6 miles per hour, has been used successfully in burning weeds out of young cotton and sugar cane.

The careless farmer or gardener who employs slovenly cultural practices is a friend of noxious weeds and provides an ever ready source of seed which plagues his more industrious neighbors.

Longevity of Seeds.—The longevity of seeds has been a subject for much speculation and research. Many a victory gardener has been amazed at the variety of unsuspected weeds that have appeared when perfectly clean sod has been broken for growing beans and tomatoes. Undoubtedly most of these have sprung from seeds which had lain dormant for years under the sod. Even so, it is difficult to believe some of the current accounts that peas taken from the tomb of King Tutankhamen have germinated. Professor Ewart writing in his booklet *On the Longevity of Seed* states: "... such fables as the supposed germination of mummy wheat have long since been exploded." The fable has been revived again in spite of the fact that the longest record of longevity for stored seeds is that of the lotus which germinated after having been in an herbarium for 250 years. In another instance, lotus seeds grew even though they had been buried in an old lake bed for an estimated 400 years! These examples are exceptional. Some weed seeds may remain alive in the soil for more than 60 years, others for a much shorter period. Cereals and most garden seeds do not live beyond 25 years in ordinary air storage. Specially dried wheat when sealed in a bottle has given as much as 16 per cent germination after 25 years of storage. Botanists have yet to publish authenticated accounts of seeds 500, 1,000 or 3,000 years old which have germinated. The fables appear to grow more readily than the seeds!

BOY SCOUTS OF AMERICA. The Boy Scouts movement was brought to the United States by William D. Boyce, and the Boy Scouts of America was incorporated on Feb. 8, 1910, and chartered by Congress in 1916. It is a nonmilitary, nonsectarian, nonpolitical organization for train-

ing boys in character and citizenship. The total active membership on June 30, 1945, was 1,934,252, comprising 1,508,753 boys and 425,499 adult leaders. Its sources of revenue (as of Dec. 31, 1944) included membership fees amounting to \$1,056,122.75; contributions of \$119,963.21; and endowment of \$82,246.16. During the year ending July 30, 1945, the Boy Scouts received 65 requests from the government for war service, including victory gardens, production and conservation, paper salvage, and the promotion of bond sales. The organization also promoted world friendship among nations having scout organizations, made efforts to re-establish scouting activities in these countries, and encouraged scouting among Negro boys. The annual meeting was held on May 17, 1945, at the Waldorf-Astoria Hotel in New York City. The organization publishes *Boy's Life*, a magazine for all boys; *Scouting*, a magazine for scout leaders; five other periodicals, handbooks, and over 500 manuals and pamphlets.

The president of the Boy Scouts of America is Walter W. Head, and the chief scout executive, Elbert K. Fretwell. Organization headquarters: 2 Park Ave., New York 16.

BOYS' CLUBS OF AMERICA, Inc. A national federation of Boys' Clubs which was organized in Boston in May, 1906. Today there are 260 Boys' Clubs and 250,000 boys in the organization. The purpose of Boys' Clubs is the guidance of boys in health, physical, mental, vocational, social, and character development. Boys' Clubs are nonsectarian in control, leadership, and membership. Any boy can belong and fees are so low that any boy can afford to belong. Boys' Clubs have buildings located in congested areas in large cities and in small cities where they are easily accessible to all the boys. Boys' Club activities are essentially character building and include recreation, physical training, vocational training and guidance, and summer camps, under trained leadership.

In the year ended Dec. 31, 1945, the activities of the parent organization were devoted to program planning, personnel training and placement, building planning, publicity and promotion of Boys' Clubs, and field service. Fifteen new member Boys' Clubs were established during the year. Publications of the organization include *Boys' Club Bulletin*, *Boys Club Service*, *Boys' Club Courier*, manuals, booklets, and leaflets. Officers on Dec. 31, 1945, were: William Edwin Hall, president; Herbert Hoover, chairman of the board; David W. Armstrong, executive director. Headquarters: 381 Fourth Avenue, New York 16, N.Y.

DAVID W. ARMSTRONG,
Executive Director.

BRADEN, Spruille, American diplomat: b. Elkhorn, Mont., March 13, 1894. Mr. Braden succeeded Nelson A. Rockefeller as assistant secretary of state for American Republics Affairs on Aug. 25, 1945. He had previously served as United States ambassador to Argentina. The 52-year-old Montanan has a background of long experience with Latin America, both as a government official and as a businessman. He was United States delegate to the Seventh Pan American Conference, convened in Montevideo in 1933; chairman of the United States delegation, with the rank of ambassador extraordinary and plenipotentiary, at the Chaco Peace Conference, 1935-39; and the late President Roosevelt's representative at the final settlement of the war between Bolivia and Paraguay, 1939. From

1939-42, Mr. Braden was ambassador to Colombia; from March 1942-April 1945, ambassador to Cuba; and from April-August 1945, ambassador to Argentina. He was educated at Yale's Sheffield Scientific School, where he took his Ph. B. in mining engineering in 1914. In 1920, he negotiated the financing and obtained contracts for the electrification of the Chile State Railways for Westinghouse.

BRADLEY, Omar Nelson, United States Army officer: b. Clark, Mo., Feb. 12, 1893. General Bradley was appointed chief of the Veterans' Administration on June 7, 1945, succeeding Brig. Gen. Frank T. Hines. His appointment came as part of President Truman's reorganization of the Veterans Bureau, which had been under fire for several months as a result of charges that it was failing both to provide the best medical care for veterans already in its hospitals and to prepare adequately for the care of additional wounded.

One of the army's four-star combat generals, Bradley commanded the Twelfth Army Group—made up of the American First, Third, Ninth, and Fifteenth armies—for the Allied conquest of Nazi Europe. He went overseas in February 1943 as aide to General Eisenhower; later held field commands in the Tunisian, Sicilian, and Italian campaigns; and in early 1944, accompanied General Eisenhower to London headquarters as Allied plans for invasion of western Europe neared completion.

A West Point graduate (1915), General Bradley spent the months of the First World War in army camps of northwestern United States as an instructor. He returned to West Point in 1920 and for four years taught mathematics there. In 1925, he was graduated from the Infantry School, advanced course, Fort Benning, Ga., and was assigned to Hawaii for three years, after which he returned to the states to complete courses at the Command and General Staff School in 1929. He is also a graduate of the Army War College (1934). In February 1941, after teaching assignments at Fort Benning and West Point and a period of service with the War Department General Staff, he became commandant of the Infantry School at Fort Benning, and was the first of the West Point class of 1915 to attain the rank of brigadier general. Before he went overseas in 1943, he held division commands at Camp Claiborne and Camp Livingston, Louisiana.

General Bradley holds the Distinguished Service Medal, awarded him for his part in the Tunisian campaign, and the Legion of Merit, for his contribution to Allied successes in Sicily. In October 1944, he was decorated by King George of England with the Order of Knight Commander of the Bath, and on March 12, 1945, was promoted full general (temporary).

BRAZIL, The United States of. A federal republic of South America consisting of 20 states, a federal district and seven federal territories, of which five were created in 1943. These are Amapá, Rio Branco, Guaporé, Ponta Porã, and Iguassú. Its area is 3,286,170 square miles and its population, estimated as of 1945, is 45,300,000. Chief cities are Rio de Janeiro, the capital, 1,782,000; São Paulo, 1,318,000; São Salvador, 294,000; Recife, 353,000; Belém, 209,000; Porto Alegre, 276,000; and Belo Horizonte, 212,000. The basic language and culture are Portuguese. A decree of 1943 established uniformity of orthography, and a treaty effective Jan. 1, 1944 provides orthographic uniformity with Portugal.

The explorer Cabral took formal possession of Brazil for the Portuguese in 1500, but official colonization commenced a quarter century later. The colony was proclaimed an independent kingdom in 1822. Under Pedro I, Pedro II and the intervening regency, the kingdom continued until 1889, when a revolution established the federal republic. In 1930 Getulio Dornelles Vargas, defeated in the presidential election of that year, led a revolt protesting fraud in the elections and became chief of a provisional government. A new constitution, adopted July 16, 1934, inaugurated the second republic, effecting a considerable reduction of states rights, and Vargas was elected president by the constituent assembly after it had declared itself a national congress. Vargas recently promised to hold democratic elections for president and a new congress.

Roman Catholicism is the dominant religion. Approximately 4,200 priests officiate in 2,450 parishes. There is a small active Protestant group of 167,457 scattered throughout all the states, but with the largest proportions in Rio Grande do Sul and Santa Catarina. Church and state are separated and the constitutions of 1934 and 1937 continue to respect the freedom of conscience and worship guaranteed under the constitution of 1891, but divorce is prohibited.

Population.—Much of the population is concentrated in the eastern and especially southeastern area. The number of persons per square mile ranges from 0.6 in the state of Amazonas to 79.2 in São Paulo State. About 60 per cent of the population is of European origin, 30 per cent mixed Indian-Negro-white, 8 per cent Negro, 2 per cent Indian. Japanese and others are less than 1 per cent. More than 4,600,000 immigrants, mostly Europeans, have come in since 1885. Today there are approximately 150,000 German inhabitants plus 1,055,000 citizens of German descent; about 1,000,000 Italians, plus 3,400,000 of Italian descent; and around 250,000 Japanese, chiefly in the State of São Paulo.

Government.—In 1937 after congress had formally declared a "state of grave internal commotion," President Vargas exercised his emergency powers to suspend constitutional guarantees, postponed the presidential election scheduled for 1938, and soon thereafter dissolved the congress and declared a new constitution in effect. This new constitution of 1937, largely credited to Francisco Campos, extended the president's mandate until 6 years after adoption of the constitution by plebiscite. Meanwhile the "transitory and Final Provisions" of the constitution (articles 175-187) provide an authoritarian regime during a state of emergency to last until the constitution is submitted by presidential decree to a national plebiscite (Art. 186-187). In his Independence Day speech, Sept. 7, 1943, and several times subsequently, President Vargas promised that the plebiscite would be held immediately upon conclusion of the war.

Meanwhile municipal, state, and national legislative bodies are suspended until the plebiscite is held. Legislative and executive functions are joined in the presidency until a congress convenes. The federal interventor system of the constitution of 1891 has been retained and state governors have generally been replaced by interventors. Authority of the latter is balanced somewhat by state administrative departments, directly responsible to the federal Ministry of Justice and Interior. Under the constitution of 1937 jurisdiction over police, public health, labor, natural resources and public lands, reserved to the states

by the constitution of 1891, are delegated to the federal government. The president's powers are increased to include the power to appoint ministers responsible only to him, to direct internal and external policies, and to nominate one of the presidential candidates. Election by universal suffrage for a term of six years is provided. The national congress is to consist of a Chamber of Deputies, elected indirectly for a 4-year term and apportioned according to population; a Federal Council, consisting of 2 members from each state and 10 appointed by the president; and a National Economic Council built on the corporative principle.

New administrative agencies which have been created, supplementing the work of the regular ministries, include a large and active National Tourist Bureau, established 1945, National Planning Commission (1945), National Council of Railroads (1941), National Council of Petroleum (1939), National Council of Mines and Metallurgy (1940), National Council for Water and Electric Power (1939), Council of Immigration and Colonization (1938), the National Commission for Textbooks (1938), and a Comissão de Industria de Material Elétrico (1944).

Brazil and the War.—Brazil severed diplomatic relations with the Axis, Jan. 28, 1942, in accordance with the agreement of the Rio de Janeiro conference of foreign ministers of that month, and President Vargas declared a state of belligerency with Germany and Italy on Aug. 22, 1942. On April 10, 1943, the Brazilian Ambassador to the United States, Carlos Martins, signed the declaration of the United Nations. On May 29, 1944 an agreement was signed with the United Kingdom like the one already in force with the United States, making Brazilians in Great Britain subject to military and other war services and vice versa. Brazil was given full part in approving the final terms of the Italian surrender, and on Oct. 19, 1943, recognized Italy as a cobelligerent.

In October 1943, the government decreed liquidation of 34 German firms and on Jan. 31, 1944 ordered expropriation of all lands granted to Axis nationals except in special cases.

Brazil co-operated in the development of air and naval bases at Recife, Natal, Belém and elsewhere. By March 1943 the base at Natal was reputedly handling a volume of traffic which made it one of the world's largest transatlantic air ports. Equipment and facilities at these bases were turned over to the Brazilian government by the United States in 1945. Brazilian forces collaborated in the anti-submarine patrol of the south Atlantic. On July 16, 1944, the arrival of a Brazilian land and air expeditionary force in Italy was announced under the command of Gen. João Batista Mascaranhas de Moraes. During the rest of 1944 and until the end of the war in Europe, Brazilian forces took an active and effective part. There were about 120,000 men overseas.

Brazil also took an active part in the meetings of UNRRA. The personnel of the Brazilian army and navy more than trebled during the war and a very considerable air force developed. Before the end of the war Brazil was building her own planes. The Brazilian navy in 1942 consisted of 2 battleships, 2 cruisers, 1 destroyer, 6 torpedo boats, 4 submarines, 6 minelayers and various other craft. A large number of destroyers, minesweepers, and medium craft were constructed in Brazilian yards during the war. These were augmented by acquisitions from the United States,

until, by the end of the war, the Brazilian Navy was the largest in South America. In addition to war supplies furnished by the United States, Brazil greatly increased its production of critical raw materials and of weapons of war.

Education.—Brazil is engaged in a program to extend its system of free elementary education. Illiteracy among the adult population is estimated at 43 per cent. A total of 42,794 primary schools enrolled 3,350,737 students in 1941; 4,572 intermediate schools had an enrolment of 419,674, while 4 universities and numerous separate faculties and institutes reported 21,098 students. A presidential decree of Nov. 14, 1942 provides funds to assist states in education, and in December 1942 the state interventors agreed to a plan which provides that 15 per cent of state revenues be set aside beginning in 1944 for primary education, and that this proportion be increased 1 per cent each year until a total of 20 per cent is reached. Each municipality, beginning in 1944, is to devote 10 per cent of its income to primary education, increasing the percentage annually until it reaches 15 per cent. A national crusade to gain popular support for a program of general elementary education has been launched in which the *Bandeira Paulista de Alfabetização* is especially active.

Finance.—The Brazilian monetary unit is the *cruzeiro* (valued about 5 cents in U.S. currency), divided into 100 centavos. Government paper notes in circulation on May 31, 1945, totaled Cr.\$15,023,573,731 (*cruzeiros*). Total national revenue in 1944 and 1945 is estimated to average about \$322,000,000, which would afford a slight surplus over expenditures. Income tax revenues which supply approximately one third of the total, were Cr.\$291,646,685.60 for the first five months in 1945, and Cr.\$241,031,444.30 for the same period in 1944. Brazil's income tax varies according to the source of the income from 1 per cent on earned income to 8 per cent on income from interest. The sales tax is applicable to all articles intended for sale to the public. Territorial property tax, location tax, and the social security tax are other means of compulsory revenue. The latter is compulsory for employees and employers and is operated similar to the social security tax in the United States. The excess profits tax (Degree Law of Jan. 24, 1944) was intended to limit war profiteering, control inflation, and direct war profits toward postwar industrial projects. Compulsory subscriptions to the Brazilian war bonds for the first 4 months of 1945 totaled Cr.\$370,499,419.10 in comparison with Cr.\$509,477,287.70 for the corresponding period of 1944.

The Decree Law No. 7,293, of the federal government, dated Feb. 2, 1945, was designed for the control of currency and credit, and to prepare the way for the organization of the Central Bank, all activities of the Central Bank meanwhile being under the control of the Bank of Brazil. This latter bank functions as a central bank for Brazil, performing its duties as financial agent for the government and completely controlling all exchanges as well as exports and imports to a large extent. It operates as a central depository for commercial banks, which are required by law to place all surplus cash on hand in excess of 20 per cent with this bank. Various pension and retirement institutes also hold enormous sums on deposit. The Bank of Brazil handles approximately one third of the nation's commercial banking business. In addition, it furnishes rediscount facilities, exercises supervision

over general banking activities, and acts as custodian for Treasury-owned gold. The bank issues the national currency and performs many of the duties discharged in the United States by the Federal Reserve System. Assets and liabilities balanced on June 31, 1944, at Cr.\$22,195,730,-000 (\$1,109,786,500).

Brazil leads all South American countries as a desirable credit risk, according to a survey of 163 representative American manufacturers and exporters made by the Foreign Credit Interchange Bureau of the National Association of Credit Men. The survey, covering the first six months of 1945, shows that Brazil shares honors with Cuba and Mexico as the most favorable credit risk in Latin America. Brazil also received the top rating of 100 per cent in the "collection" classification, showing her to be "prompt" in meeting her commercial obligations with American business men. The survey also revealed that approximately "nine out of ten" American exporters during the first six months of 1945 continued to grant their Latin American buyers the same trade terms as they did during 1944.

According to the latest releases of the United States Treasury Department, the private investments of American citizens in Brazil are estimated at \$337,242,028. The British investments in Brazil total \$951,063,396, or about three times the American investments. Heaviest American investments are in manufacturing, public utilities and transportation, and distribution agencies. Agriculture and mining also represent important investments. The British investments are largely in Brazilian government issues and in railroads.

Communications.—All transport in Brazil experienced growth and expansion under the impetus of wartime pressure. The growth of air transportation surpassed any other nation in South America. Passengers carried in 1944 were 244,516 or nearly three times the volume in 1940. Air freight in 1944 was more than 7,632,255 pounds, or nearly a sixfold increase. The latter was exclusive of 10,573,358 pounds of baggage and mail. There are over 160,000 miles of highways and 243,000 motor vehicles. Railroad extension and reconstruction in some areas supplying strategic war materials received help from the Export-Import Bank of Washington. There are 21,250 miles of track. The National Department of Railroads of Brazil signed contracts in 1945 amounting to \$5,244,500 for the purchase of 50 locomotives, all from United States firms. The Brazilian government authorized (1945) the construction of 24 new ships for the Lloyd Brasileiro Line, which is under the jurisdiction of the Ministry of Transportation and Public Works. Fourteen were ordered from United States shipyards and ten from Canada. All are scheduled for delivery in 1946. They will replace about an equal number of ships lost by the Lloyd line during the war. There are 97 broadcasting stations in 78 cities, over 5,000 telegraph offices with approximately 78,000 miles of line in use, and nearly 300,000 telephone instruments. Orders for new equipment and replacement parts in the hands of American manufacturers by the end of 1945 were nearly equal to 25 per cent of all communications equipment now in use. The demand for radio receiving sets is expected to be even greater. There were (1943) 898,000 sets in use. The 4,870 post offices handle about 2 billion pieces of mail annually.

Agriculture and Forest Products.—Brazil's struggle to revolutionize her agricultural econ-

omy, to reduce her dependence on coffee and cotton, has thrown international light on the extensive variation of her products and the possibilities for future development of her natural agricultural and forest resources. Four fifths of the world's coffee is grown in Brazil, the annual production averaging 13 million bags of 60 kilos each, and accounting for over 45 per cent of all Brazilian exports before the war. United States purchases of Brazilian coffee under the Inter-American Coffee Quota Agreement kept exports up during the war (9,800,000 bags annually); nevertheless, large annual surpluses required systematic destruction throughout the war period. According to the Brazilian press, there are 2,154,610,000 producing coffee trees in Brazil. Brazil's rice production of about 136,000 metric tons per year is the largest in the hemisphere. Cotton ranks second in value among the country's exports, annual production being about 600,000 metric tons. Brazil is the second largest producer of cacao in the world, and this product ranked fourth among her exports in 1945. Annual production has gradually increased in recent years, with the latest estimates at 120,000 metric tons. Brazil was the world's largest producer of sugar until Cuba and the United States came into the competitive field. The 1944 crop amounted to 1,300,000 metric tons.

Annual tobacco production is about 98,500 tons, most of which is consumed locally. Corn is one of Brazil's most important crops, being cultivated on some 3,750,000 acres, and largely consumed within the country. Manioc is an important crop, from which flour, alcohol, acetic acid, dextrines, glucose, and glue are produced. Exports have declined since its use in the making of bread was made compulsory, but it is still in demand as a source of tapioca. Annual production is over 7 million tons.

Brazil is the second largest producer of oranges and the third largest exporter. Lemons, grapefruit and mandarines also are exported. Bananas are grown throughout the country. Argentina is the chief market; therefore, exports were little affected by the war. Exports in 1940 were 10,247,846 bunches.

Brazil's livestock industry is one of the largest in the world, and provides the country with some of its most important exports, meat, hides, and skins. In 1940 there were 45,988,477 head of cattle, 6,488,941 goats, 7,321,010 horses, 25,714,466 swine, 15,098,500 sheep, and 4,453,905 asses. The zebu from India has been crossed with Brazilian cattle to make the most satisfactory breed now produced in the country.

The forests of Brazil cover approximately one billion acres or over half the area of the country. They are second only to those of the USSR in extent, and rank first in variety of woods and products. Lumbering is becoming an important local industry and exports of lumber rank tenth in importance. Under the stimulus of wartime demands, rubber again became important in Brazilian trade. Production of wild and plantation rubber exceeded 45,000 tons before the end of the war. The rubber agreements between the United States and Brazil were (in 1945) extended to June 30, 1947. The extension continues the validity of (1) an agreement of March 3, 1942, which provides for the purchase and sale of natural rubber and for related matters; (2) an agreement of Sept. 29, 1943, supplemental to the agreement of March 3, 1942, which confirms an increase in the basic rubber price per ton from U.S. \$39 to U.S. \$45; (3) an agreement

of Oct. 3, 1942, which establishes a system for the allocation and supply of tires and tubes; (4) an agreement of Dec. 22, 1944, which modifies the agreement of Oct. 3, 1942, and which provides for the utilization of synthetic rubber in the manufacture of rubber products in Brazil; and (5) an agreement of Feb. 8, 1944, extended by a further agreement of Dec. 12, 1944, which provides for the payment on purchases of rubber of a price premium amounting to 33½ per cent of the basic rubber prices.

Brazil's great forests produce over 60 varieties of commercial waxes and vegetable oils. Carnauba wax is the most important, production ranging between 9,000 and 11,500 tons. Uricuri wax, similar to carnauba, is used chiefly in the manufacture of soap. Production is about one fourth the production of carnauba. Brazil nuts form the main export product of the states of Amazonas and Pará, exceeding even the rubber exports. A production of 34,440 metric tons in 1939 dropped to 21,211 in 1942, largely due to the transfer of labor to rubber production. Vegetable oils occupy ninth place among Brazil's exports. This includes cottonseed oil (accounting for about 75 per cent or 26,500 metric tons annually), oticica oil, castor oil, and babassu, linseed, copaiba, corn, and andiroba oils. Small quantities of coffee oil and ucuuba oil are also exported.

Among the fibers produced by Brazil are cotton, silk, flax, jute, caroa, tucumá, and piassava. Piassava is used in making brushes and brooms, tucumá for fishing lines, and caroa is remarkably water resistant and elastic.

The Brazilian silk industry has been helped by Japanese and Italian immigrants, although today the industry is entirely Brazilian-owned. More favorable climatic conditions than those of Japan (Southern Brazil: 4 to 6 harvests of cocoons per year; Amazon Basin: 10 to 12 per year, compared with 2 per year in Japan), have been important factors in creating a production sufficiently large to care for domestic needs as well as a small surplus for exports. The first and still official center of Brazil's sericulture is the Regional Inspectorate of Sericulture at Barbacena, Minas Gerais, though the State of São Paulo is the greatest producer. By 1940, three reeling basins were in operation in that state and at the end of 1944, there were 25 filatures with a total of 2,595 reeling basins. The Sericulture Service of the State of São Paulo plans construction of 33 buildings to house silk spinning mills in the city of São Paulo and the erection of 44 additional mills in various other localities in the state. In 1941, there were 36 silk spinning mills in São Paulo; and 56 in 1943. Other important silk producing states are Espirito Santo, Minas Gerais, Pernambuco, Rio Grande do Sul, Rio de Janeiro and Santa Catarina. Estimates place the 1945 reeled silk production at approximately 500 metric tons (1,102,300 lbs.). Exports are expected to be about 70 per cent of this production.

Yerba maté (or, in Portuguese, *Herva matté*) production is confined to the southern states and figures largely in the export trade. Annual consumption averages 76 million pounds and exports about 132 million pounds, going mostly to Argentina. Rotenone production has increased under government aid and expanded foreign demand.

Industry.—The value of Brazilian manufactures surpasses that of agricultural production by 200 per cent. Manufacturing industries of Brazil are more highly developed than those of

any other Latin American country except Argentina. Production in 1945 exceeded \$1,500,000,000. While large factories exist in Rio Grande do Sul, Pernambuco, Rio de Janeiro and other states, the main industrial center is São Paulo. The principal manufactures have been as follows, in order of importance: foodstuffs, textiles, glass and ceramics, leather articles, iron and steel products, articles of apparel, paper and cement. Brazilian textile mills have exported cotton goods to various other Latin American countries and Africa in recent years. Suitings, shirtings, novelty goods, leather articles, cotton gloves, preserves, chinaware, pharmaceuticals, footwear, carpets, rugs, and silks have found consumers recently in the United States, thus replacing goods formerly imported from Europe and the Far East.

The heavy and basic industries are now being developed, such as steel, aluminum, motor, glass, and paper manufacturing. An Export-Import Bank loan of \$45,000,000, matched by an equal contribution of Brazilian funds, has created the huge Volta Redonda steel mill on the Paraíba River, capable of supplying nearly all of Brazil's present steel needs. A new airplane motor factory near Rio de Janeiro now produces the motors for Brazil's new airplane factories.

Since 1937 meat has been the principal food industry, and the most important of the primary industries. The total value of animal production is placed at around \$22,000,000, equal to about 40 per cent of total farm output. Brazil holds fifth place in world production and exportation of beef. Annual production is 1,097,000 tons.

The textile and related industries are the second most important manufacturing group and accounted for approximately 35 per cent of the total value of manufactures in 1945. In 1940 there were 340 cotton textile mills with 2,600,000 spindles and 82,000 looms. Production of silk and rayon piece goods, chiefly rayon, increased about 200 per cent in the past five years. A viscose rayon plant, whose yearly production of 20,000,000 pounds will exceed the combined output of other similar plants in South America, is to be built near São Paulo by a United States firm at an estimated cost of \$18,000,000, financed entirely by Brazilian private capital. Production of shoes, ranging in recent years from 38 million to 44 million pairs annually, supplies almost all domestic requirements. In order to meet clothing commitments with UNRRA for devastated Europe, the Textile Commission of Brazil has suspended all exports of cotton textiles (until August 1946) to Sweden, Norway, Egypt, Turkey, United States, Spain, Switzerland, Canada, Belgium and Palestine.

The drug, chemical, and related industries were the fourth most important industrial group in 1945. Although Brazil must import large quantities of most of her chemical needs, she is becoming self-sufficient in about 40 of these products. Largest production is in alcohol, perfumes, cosmetics, vegetable oils, paint, candles, explosives and plastics. Brazil now produces a large portion of its needs in tin plate, enameled and galvanized steel, and aluminum manufactured items. The goal of the Brazilian industries is to increase production until many of these items will be on the surplus for export list.

The rubber goods industry has 138 registered factories and production is sufficiently large to warrant some export. Automobile tires and tubes account for about 50 per cent of the output.

Brazil's hydroelectric potential of 19,500,000

horsepower places it sixth in the world. Installed capacity is 700,000 horsepower. Hydroelectric power is expected to prove a basic factor in the postwar industrial expansion of Brazil. The program for development is the most ambitious in Latin America, calling for the construction of several large dams in widely scattered areas. The largest single project so far announced is the São Francisco River project which resembles the TVA in the United States. Other projects are being developed in the Rio Doce Valley.

Mining.—Although one of the richest countries in the world in mining resources, Brazil's most extensive exploitation has been limited to a few strategic minerals. With the cessation of war, Brazilian miners are turning their attention to the production of minerals needed in the rapidly expanding consumer industries. Production of diamonds, bauxite, mica, quartz, rutile or titanium, and tantalite, so much in demand by the United Nations war industries, are expected to maintain a steady output but not continue the rapid upward trend in production which they experienced during the war. Coal and iron output awaits only the improvement in transportation and the necessary equipment to begin a local boom in these and allied industries.

Brazil has about 29 per cent of the world's known reserves of iron ore. Found mostly in Minas Gerais, the Brazilian ore has an iron content of 70 per cent, considered one of the best. With the completion of the Volta Redonda steel mill near Rio de Janeiro, Brazil hopes to supply most of her domestic needs in this metal. Manganese, the component necessary to the steel industry, is an important item in exports, averaging nearly 300,000 tons annually during the war years. Some of the world's largest deposits of aluminum ore or bauxite exist in Minas Gerais, Maranhão, and Espírito Santo. Considerable quantities of this ore have been exported recently to the United States and Argentina. Development of a domestic industry is awaiting machinery from the United States. Reserves are estimated at 150,000,000 tons.

Once the world leader in gold production, Brazil is now in sixth place. Production in 1943 was 4,986 kilos. By law, all gold found in Brazil must be sold to the Bank of Brazil. Diamonds are found in various sections of Brazil but particularly in Minas Gerais, Goiás, Amazonas, Baía, Paraná, and São Paulo. Brazilian diamonds are exported under two classifications: diamonds and carbonado. The first is the source of gem stones and the latter is a dark variety, opaque, without a clear-cut crystalline form, and usually yellow, dark gray or black. These are generally very hard and largely in demand as industrial diamonds. Recent exports have been as follows (in grams):

	1942	1943	1944
Carbonados	2,723	3,899	2,159
Diamonds	47,164	39,457	38,457

Exports during the first quarter of 1945 were 9,653 grams valued at \$2,229,400.

Mica is found in various sections of Brazil, but mainly in the eastern region of Minas Gerais, the southern region of Baía and the southeast of Goiás. Exports in 1944 were 941,000 kilograms, valued at over \$2,300,000. Rock crystals or quartz is found in the states of Amazonas, Maranhão, Ceará, Rio Grande do Norte, Paraíba, Espírito Santo, Baía, Minas Gerais, Goiás, Mato Grosso and others. Exports in 1944 were 1,122,000 kilograms, in 1943, 2,411,000 kilograms, and in 1942, 1,770,000 kilograms. Titanium is found

in abundance in Brazil, occurring in the form of rutile, principally in the states of Goiaz, Minas Gerais and Ceará. Exports in recent years were as follows:

	Metric tons	Value in dollars
1940	499	70,345
1941	2,369	280,489
1942	4,615	455,116
1943	4,557	630,650
1944	1,564	156,400

Tantalite, rarer than gold, though considerably less expensive at \$65 a pound, was so indispensable to American war industry that it was one of ten materials kept under strict censorship. Production in 1944 was about 500,000 kilos. The magnesite deposits of the State of Ceará alone are so vast that they could supply the world's needs for this mineral indefinitely, according to a recent report by engineers of the Brazilian Department of Mines and Metallurgy.

Foreign Trade.—The United States is Brazil's most important customer and the source of most of the country's imports. More than 54 per cent of Brazil's total exports during the first six months of 1945 were taken by the United States. The latter's purchases of Brazilian goods reached the record-breaking total of \$133,781,250 with coffee shipments alone amounting to \$73,832,400. United States purchases of Brazilian products have risen steadily under the pressure of wartime requirements. In 1939 American purchases accounted for only 36.26 per cent of the total value of Brazilian exports. In 1944, they rose to 53.08 per cent, and the new peak hit during the first six months of 1945 is not expected to be exceeded by the end of the year. Brazil's exports, from January to June of 1945, amounted to 1,393,101 tons, valued at \$247,067,650. During the corresponding period last year 1,239,332 tons were exported, valued at \$249,674,450. The increase therefore amounted to 12.41 per cent over the tonnage exported in 1944. This increase declined slightly during July when the seven months total showed nearly 11 per cent over the corresponding seven months of 1944. Shipments, most of which continued to go to the United States, totaled \$304,480,100 as compared with \$289,470,550 during the same seven months in 1944. Tonnage for the same period registered an approximate 6 per cent rise, amounting to 1,635,998 metric tons, as compared with 1,478,098 tons for the same seven months of 1944.

Raw material shipments during the seven months, January to July 1945, showed an increase of 228,470 tons or \$5,007,650. Foodstuffs declined 80,845 tons or \$9,677,450, though drops in exports of coffee, rice, cocoa, beans, sugar, and meat were less than during the first six months of 1945. Manufactured products increased 10,329 tons or \$19,686,350. Brazil's ten leading exports during the first six months of 1945 were: coffee, cotton textiles, raw cotton, rubber, pine, carnauba wax, hides and skins, castor beans, cocoa beans, and preserved meat. These products accounted for slightly less than 50 per cent of total tonnage and approximately 70 per cent of the total value. Cotton textiles deserve special mention, in view of the importance they have assumed recently among Brazilian exports. Principal markets are in South America, where Argentina is the biggest buyer. South Africa is next in importance as a foreign market for Brazilian cotton textiles. Between January and June 1945, the Eastern Hemisphere took 72.54 per cent by volume and 79.71 per cent by value of Brazil's total exports. Europe accounted for 23.25 per cent and Africa

16.45 per cent. During this same six months period Brazil imported merchandise totaling 2,099,952 tons valued at \$213,172,450. During the same period of 1944 the volume was 1,828,975 tons valued at \$178,051,150. Raw material imports showed a relatively small increase compared with livestock. Though the importation of fuels was not adequate to the nation's needs, shipments of such supplies were higher. Fuel oils and lubricants also registered an increase, though coal imports were somewhat lower and cement imports were more than doubled. The United States supplied by far the larger portion of Brazil's imports.

Important Events.—On Jan. 10, 1945, President Roosevelt nominated Adolf A. Berle, Jr., to be United States Ambassador to Brazil. President Vargas announced February 28, the government's intention to hold general elections, the election date to be announced within 90 days. The elections, first in 15 years, would be for president, deputies and Federal Council members, and President Vargas announced later, March 11, that he would not be a candidate. On March 13, Minister of War Gen. Eurico Gaspar Dutra was nominated to run against Maj. Gen. Eduardo Gomes and the latter's backers claimed this was a move designed to split the army and create confusion.

Relations with Russia were resumed on April 2. On April 4 the United States filed a protest against Brazil's new consumption tax, claiming that items included in the Brazil-United States trade treaty of 1934 as exempt from taxation were mentioned in the new law. Promises to enforce religious freedom and permit legitimate strikes were made April 5 by the new police chief of Rio de Janeiro. On April 15 Brazil agreed to increase its exports of cotton fabrics in the following year by 300,000,000 yards. The agreement, announced by the Combined Production and Resources Board in Washington, also provides for 80,000,000 yards to be purchased by Allied Governments for liberated areas. These new allotments were announced as being in addition to previous commitments of 200,000,000 yards of fabrics in 1945.

Luis Carlos Prestes, famous Brazilian Communist and political prisoner for nine years, was released April 18 under a general amnesty signed by President Vargas freeing political enemies and granting political exiles the right to return to Brazil. On April 26 Prestes indicated that he might be a candidate in the coming presidential elections. On April 21 the Brazilian government revealed it had repaid the first three installments due on materials received under lend-lease. The amount paid was \$35,000,000 and was made in March.

President Vargas announced his support of General Dutra for president in a speech on May 1, and repeated his intention to retire to private life. The following day Gen. H. H. Arnold of the United States Army Air Forces arrived in Rio de Janeiro and conferred with President Vargas, and on May 3 General Dutra announced that Brazilian soldiers in Italy would return home at once. A new political party, called the Social Democratic Party, backing General Dutra for president and advocating more private capital development of industry, a federal democratic form of government, free education and protection of labor, was announced May 9. Armando Salles, leader of the Paulista revolt in 1932, died on May 17 in São Paulo.

On May 28, President Vargas officially set

the date December 2 for the presidential and congressional elections, and May 6, 1946, for the election of state assemblies and governors, municipal councils and mayors. Brazilians over 18 were ordered to register. A decree issued October 10 advanced the local elections to coincide with the presidential elections December 2. Cable and wireless companies were instructed to end censorship on press dispatches May 30, and Dr. Julio Barata was sworn in as head of the nation's new National Department of Information. This department succeeds the old Department of Press Propaganda.

Brazil declared war on Japan on June 6. The Brazilian Supreme Tribunal accused President Vargas (June 14), of seizing power illegally on Nov. 10, 1937, and charged him with other political offenses.

In an open-air meeting on Sunday, July 1, War Minister Gen. Eurico Gaspar Dutra was officially proclaimed as a candidate for president of Brazil and promised the backing of the Social Democratic Party. United States Admiral Jonas H. Ingram told Brazil on July 6 that, within two days or by July 8, all naval bases in Brazil occupied by the United States would be returned to Brazil. The Brazilian cruiser *Batá* exploded and sank in the Atlantic about 100 miles off the Brazilian coast on July 8 with a loss of nearly 300 lives. Press dispatches indicated that it struck a submerged mine. The Rev. don Carlos Duarte de Costa, bishop of Maura in São Paulo State, was excommunicated by the Pope on July 6, accused of preaching revolutionary practices. The Brazilian clean-up of Japanese spy elements resulted in the arrest on July 12 of nine Japanese members of a sabotage ring operating in São Paulo. Among them was Col. Jurji Kikawa of the Japanese Army. United States Gen. Mark W. Clark reviewed the Brazilian Expeditionary Force on its triumphant return to Brazil on July 18.

President Vargas was launched as a candidate to succeed himself on August 1, but he let the deadline of September 2 pass without filing his intention of running for re-election, and on September 10, he decreed amnesty to all Brazilians accused of expressing opinions against him or his regime. On October 3 he told a rally of 100,000 in Rio de Janeiro that "I reaffirm that I am not a candidate for the presidency," and the following day the opposition attacked the speech as full of "evasions." The Brazilian War Minister Gen. Eurico Gaspar Dutra resigned on August 3 in order to campaign for the presidency. He was succeeded by Gen. Pedro Aurelio de Goes Monteiro. Announcement was made on August 4 that the United States-Brazilian rice purchasing agreement was to be extended another year after its expiration in April 1946, and that a 10 per cent increase in price would be effective. The Inter-American Juridical Commission, meeting in Rio de Janeiro on August 10 declared the atomic bomb lawful and further decided that the head of an aggressor state is criminally liable and subject to the judgment of an international tribunal. Permission to publish newspapers in the four hemispherical languages, English, Spanish, Portuguese, and French, was given in an amendment August 11 to Brazil's 1941 publication ruling.

On October 27 isolated street fighting broke out between supporters of President Vargas and followers of presidential candidate General Gomes after the police had forbidden a mass meeting to protest against the holding of the presidential elec-

tions scheduled for December 2. On October 30, Getulio Vargas resigned or was forced to resign as president, and, in accordance with Brazilian law, the office was turned over to the Chief Justice of the Supreme Court, José Linhares. João Alberto Lins de Barros, chief of the federal police, was replaced the previous day by Benjamin Vargas, younger brother of President Vargas, and Lins de Barros was announced as the assistant to Linhares.

Getulio Dornelles Vargas seized power in Brazil in 1930 and became president four years later under a new constitution. His term as president was the longest in the nation's history.

BRAZZAVILLE. See FRENCH EQUATORIAL AFRICA.

BRERETON, Lewis Hyde, United States Army Air Forces officer: b. Pittsburgh, Pa., June 21, 1890. A veteran of the Philippine and Java campaigns, 1941-42, and former United States air commander in the Middle East, General Brereton served on almost all the major battlefronts of the Second World War. His final combat assignment was that of commanding general of the First Allied Airborne Army, activated in August 1944. (Until its creation, all Allied airborne troops, including parachutists, had functioned as part of Allied ground forces and had been divided among the various ground commands.) In September 1944, General Brereton's Airborne Army was landed in Holland astride the Meuse, Waal, and Lower Rhine rivers in the Eindhoven-Arnhem area; this was the largest airborne operation ever attempted, and required the employment of 2,800 planes and 1,600 gliders on the first two days. It was Brereton's 101st Airborne Division which fought so superbly at Bastogne in December 1944.

A graduate of the United States Naval Academy (1911), General Brereton resigned from the navy shortly after he was commissioned an ensign to become a lieutenant in the army's Coast Artillery Corps. He received his flight training in 1912, and in the First World War, commanded an American flying unit on the western front. In addition to his Second World War service in the Pacific, he also took part in the North African campaign as head of the United States Ninth Air Force, and later planned and directed the first devastating air assault (Aug. 1, 1943) on the Ploesti oil refineries in Rumania from which the Axis had been obtaining 3,000,000 tons of oil a year. From February until August 1944, he directed Ninth Air Force operations over Europe. General Brereton's service medals include the Distinguished Service Cross, the Air Medal, the Distinguished Service Medal, the Silver Star, the Purple Heart, and the Distinguished Flying Cross.

BRIDGES. In 1945 a few bridges were completed in the United States and many remained in the planned or projected state; while in Europe literally hundreds of bridges, the product of a half century of designing and building, were destroyed or partly wrecked by the war. The abrupt ending of the war with Japan found most projects still in the planning stage, but several projects, in anticipation of V-J Day, were in position to make an early start. In 1944, the American Association of State Highway Officials estimated the cost of projected highway bridges would amount to about \$800,000,000 and other authorities estimated

there would be in addition about \$250,000,000 worth of municipal bridges projected. The trend of material and labor costs at the end of 1945 indicated that these figures would be exceeded substantially.

Throughout all the battle ground of Europe the Allies wrecked bridges to hamper the movement of German troops and their supplies, and the Germans furthered this destruction in their desperate effort to prevent Allied invasion of Germany. Practically all the great bridges over the Rhine and other chief rivers were wrecked or damaged to make them impassable. In anticipation of this the British and American Army Engineering Corps had prepared several types of demountable steel truss bridges in addition to the lighter army treadway pontoon type.

Military Bridges.—The Bailey Bridge.—The most famous and most used type of these truss bridges is the "Bailey bridge" named after its inventor, Donald C. Bailey, an eminent British civil engineer. It is a simple lattice type truss, made up of 10-foot panels. A section of two of these is light enough for six men to carry. All like parts are interchangeable and are bolted and pinned together on location of the crossing. The cross members that support the floor extend outside the truss at panel joints, and the ends of these support the side bracing of the truss. The usual cross-bracing is used under the floor members. The assembling of the bridge is on rollers leading back from the edge of the bank of the stream. As sections are built back from the edge of the bank the erected part is pushed out overhanging the water, but keeping enough of the sections on the land end to overbalance the outer part. In this way the outer end finally reaches the opposite shore, and there is a corresponding structure extending back on land. To cut down the overhanging weight, and enable the bridge to extend further over the stream, there are a number of specially light sections built on the advance end of the bridge. This is called the "nose", and when it reaches the far bank and is resting on rollers there, the building continues until the heavy section reaches the far bank. The nose is then dismantled for future bridges, and the floor is laid on the regular bridge. This is the method of erecting over narrow streams without falsework. For wide streams, such as the Rhine, the outer end is built and pushed out to a group of special pontoons anchored in the river. With the end resting on the pontoons, building continues by floating the bridge across as it is built. Bridges were put across the Rhine 1,200 feet long in ten days. At Gennep, Holland, a bridge nearly a mile long was put across the Maas (Meuse) River and the adjoining flooded land. The Bailey bridge has a 10 foot, 9 inch roadway. To make a stronger bridge, provision is made for putting an extra truss outside the first truss, doubling its load capacity. Even three lines of trusses can be built on each side of the roadway, and other trusses built on top increasing the truss depth that much, and further increasing its carrying capacity.

Demountable V-type Bridge.—Another outstanding type is the demountable V-type bridge. It is used for spans up to 90 feet for replacing railway bridges, and for spans up to 240 feet for vehicular traffic. These structures are built up of four main duplicating parts of not over 400 pounds each. The two trusses have one common tension member, with the trusses sloping apart and the compression members tied across at the

top by the deck beams, making a triangular, or V cross-section. This is the deck type. For a through type the deck beams go across about half way down, giving a cross section like an inverted A. Each truss is connected with a Warren type web system. All like parts are interchangeable. This bridge is erected on piles or pontoons, or on remaining piers of wrecked bridges.

Memphis-Arkansas Bridge.—One of the first major bridge projects to get under way in the United States in 1945, is the four lane Memphis-Arkansas bridge over the Mississippi River. This bridge has been dreamed of for years to meet the needs of increasingly heavy highway traffic at the principal Mississippi crossing below the Ohio River. In 1944 the site was chosen to reach from Iowa Avenue in Memphis to the top of the St. Francis Levee in Arkansas, and located down stream from the two existing bridges, one of which has a two lane highway deck with a railway track between. Plans were completed and in July 1945, contracts were let for the seven main piers to the Merritt Chapman and Scott Company of New York for \$4,333,174. The piers will go down 89 feet below the mean low water mark, and will be 200 feet high. The main cantilever span will be 790 feet long. On the Arkansas side there will be 481 feet of reinforced concrete trestle on pile foundations. The bridge is financed by the Tennessee and Arkansas Highway departments and the city of Memphis. The original estimate of \$8,000,000 will probably be exceeded by \$2,500,000 due to higher labor and material costs.

Harry S. Truman Bridge.—This year saw the completion of the "Harry S. Truman" Bridge over the Missouri River at Kansas City; built jointly by the Chicago, Milwaukee and St. Paul and Rock Island railroads. Total length is 2,633 feet, with a 420-foot vertical lift span over the river channel, electrically operated. The rest of the bridge consists of three 250-foot through truss spans and 19 deck girder spans. The lift span weighs 1,600 tons, and in raised position is 70 feet above mean low water. In closed position 34 feet above low water. The bridge is for a single track railroad to cut off several miles between Chicago and the Southwest.

Santa Fe Railroad Bridge Over the Colorado River.—The magnificent bridge on the Atchison, Topeka and Santa Fe railroad which has been building for some time over the Colorado River was also announced to be finished in 1945 and opened for traffic. It is part of a great rebuilding project of this road to make the Santa Fe system a "hundred mile an hour road" to the Southwest.

Newark-Harrison Bridge.—Work soon will be started in New Jersey on the long delayed bridge to be constructed between Newark and Harrison. The War Production Board cleared the way in June for release of steel for the bridge. This will be a six lane bridge, each 12 feet wide, and with sidewalks, to accommodate the heavy traffic which amounts to from 30,000 to 50,000 vehicles per day. It will have 35 foot clearance over the water, and is expected to cut down draw-span openings 50 per cent.

General.—On Long Island, New York, the State Park Commission has recommended the postwar construction of a \$3,000,000 six lane draw span bridge to replace the present narrow Atlantic Beach span over Reynolds Channel. It is recommended that it have 21 feet clearance over water instead of 15 as in the present bridge,

55 feet between concrete piling and a horizontal clearance at the draw span of 100 feet.

In Connecticut a commission was appointed in May 1945 to plan and provide financing for a \$6,000,000 bridge over the Connecticut River between Saybrook and Old Lyme.

In New York City the Triboro Bridge Authority reports that for the first time since 1942 the revenues from tolls in the first half of the year exceeded the interest costs plus operating expenses. The five bridges operated by the Triborough Bridge Authority accommodated 9,913,850 vehicles in the first half of the year, an increase of 7.65 per cent over the number of vehicles using the bridges in the first half of 1944, and showed an increase of 8.3 per cent in revenue. This increase in a time when the greatest strictures were in force on motor traffic may be some indication of what revenues will be when the new output of motor cars comes on the market in quantities, and all restrictions are taken off the output of tires and gasoline, a condition much needed to relieve many toll highway bridge companies that now cannot fully meet interest on bonds plus maintenance. The New York Triborough Bridge Authority also has sold \$2,750,000 treasury notes to raise funds for the reconstruction work on the Bronx-Whitestone suspension bridge, which is of the same type as the Tacoma Narrows Bridge that collapsed in a strong gale and must be entirely rebuilt. This was due to the plate girder deck stiffening offering too much surface to cross winds.

E. C. McDOWELL,
Consulting Engineer, New York City.

BRISCOE, Benjamin, United States naval officer and industrialist: b. Detroit, Mich., 1867?; d. near Dunnellon, Marion County, Fla., June 26, 1945. A pioneer in the early development of the automobile industry, Comdr. Benjamin Briscoe, U.S.N.R. (retired) achieved his greatest success in business as president of the Maxwell-Briscoe Motor Company during the early 1900's.

The automobile industry was in its infancy in 1901 when he helped finance David Buick's first car. In 1913 he brought out the Briscoe car, but with the beginning of the First World War he turned his manufacturing facilities over to war production. This eventually led to his joining the navy with the rank of lieutenant commander. He saw service in both Italy and France and received the Navy Cross. After the armistice, Mr. Briscoe assisted in the development of a new process for refining crude oil and then went to Montreal as an executive in the Frontenac Oil Company. From the oil business he moved into gold mining and ore milling in Colorado. He retired from active participation in business in 1938.

BRITISH CAMEROONS. See CAMEROONS.

BRITISH COLUMBIA. Third in size among the Canadian provinces, British Columbia has an area of 366,255 square miles, and a population (1941) of 817,861. (Provisional estimate for June 1, 1944, 932,000.) It is traversed by four great mountain ranges—the Rocky Mountains, the Selkirk Range, the Monashee Range, and the Coast Range—all running in a northwesterly direction and approximately parallel. The valleys are richly fertile. Various parts of the province have wide differences in climate, the temperature varying considerably according to the latitude, and the rainfall being heavy or light, according to the degree of exposure to the moisture-laden winds from the Pacific. The coast is

rugged and deeply indented, and is protected by a long chain of islands, the largest of which, Vancouver Island (area, 12,408 square miles; 1941 population, 121,933) is a highly prosperous agricultural center. Here is situated Victoria, the capital (pop. of Greater Victoria, 1941, 75,218). Vancouver, on the mainland, is the hub of the province's industrial activities, and ranks third among Canada's cities (Vancouver proper, 1941, 275,353; Greater Vancouver, 351,491). It is an important seaport and a well-developed residential area. Other cities, with their 1941 populations, are: New Westminster (21,967); Trail (9,392); North Vancouver (8,914); Prince Rupert (6,714); Nanaimo (6,635); and Kamloops (5,959).

Education.—Education is free and compulsory between the ages of 7 and 15. In 1942-43 there were 1,179 publicly conducted schools, including elementary schools, junior high schools, high schools, and superior schools, as well as a number of private establishments modeled on the English public schools. The University of British Columbia provides a full curriculum. There are two normal schools.

Government.—British Columbia entered the Canadian confederation on July 20, 1871, and is represented in the Dominion Parliament by 6 senators (appointed for life), and 16 members of the House of Commons. Local or provincial government is administered by a lieutenant governor and a Legislative Assembly of 48 members. In the general election held on Oct. 25, 1945 (the first since 1941), the Liberal-Progressive Conservative coalition won 35 seats, the Co-operative Commonwealth Federationists 9, Labor 1, with 3 seats still unreported on October 27. In 1945 the lieutenant governor was Colonel the Hon. William Culham Woodward (appointed 1941); premier and minister of finance, Hon. John Hart (Liberal).

Revenue and Expenditure.—The estimated revenue in 1944-45 was \$34,600,000; estimated expenditure, \$34,500,000.

Industries.—The basic industries of British Columbia are logging and lumbering, agriculture, mining, and commercial fishing. These industries, in 1943, yielded the following returns:

Logging and lumbering (actual).....	\$118,434,000
Agriculture (est'd)	77,500,000
Mining (actual)	65,892,000
Fishing (est'd)	32,500,000

British Columbia, with an industrial payroll of \$381,000,000 in 1943, ranked third among the provinces in the production of manufactured goods, specializing in shipbuilding. On Jan. 1, 1945, British Columbia ranked second (to Quebec) among the provinces in available electric power resources, with a 24-hour all-year minimum flow of 7,023,000 horsepower, and an additional 6 months flow of 10,998,000 horsepower. During 1945 the provincial power commission began British Columbia's first public hydroelectric project (a 50,000-horsepower plant on Vancouver Island); planned a unified power system, mainly under public control, for the island; and arranged to take over systems operated by three private corporations. Permission was granted by the provincial government for the importation of some 200,000 horsepower from the Bonneville project in Washington State. The total basic railway mileage in 1942 was 3,849 miles. The 1,000-mile highway from Fort St. John to Fairbanks, Alaska, built during the Second World War by the United States Army, is to pass on April 1, 1946, to the Canadian Army.

	Killed ¹	Missing	Wounded	Prisoners of war	Total
United Kingdom	244,723	53,039	277,090	180,405	755,257
Canada	37,476	1,843	53,174	9,045	101,538

Totals	353,652	90,844	475,070	326,459	1,246,025

¹ Including died of wounds or injuries.

² Including 20,147 officers and other ranks missing but presumed prisoners.

BRITISH COMMONWEALTH OF NATIONS. In a restricted sense, the collective name for the United Kingdom of Great Britain and Northern Ireland, the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, the Union of South Africa, Eire, and (sometimes) the Indian Empire. Increasingly, the term has come to include, also, the British colonies, protectorates, protected states, and mandates; "British Empire" and "British Commonwealth and Empire" are other terms used in this sense. The total area of 13,353,952 square miles exceeds one fourth of the land surface of the globe; and the estimated population of 500,774,000 exceeds one fourth of the estimated total of the human race.

The reigning King and Emperor is George VI, born Dec. 14, 1895, son of King George V and Queen Mary; he succeeded to the throne on the abdication of his brother, King Edward VIII, Dec. 10, 1936. He was married to Lady Elizabeth Angela Marguerite Bowes-Lyon on April 26, 1923. Princess Elizabeth Alexandra Mary, born April 21, 1926, is Heiress Presumptive.

During the Second World War, the British Commonwealth of Nations had suffered casualties amounting to 439,959 by the close of hostilities on Aug. 14, 1945. Of this total, 193,934 were the casualties among the British Merchant Navy, the Home Guard, and civilians, casualties among the armed forces, numbering 1,246,025. The latter total was made up as shown at top of page.

Thus, the British of the home islands sacrificed more lives in total than all the rest of the Commonwealth combined. Moreover, they lost a greater number in proportion to population than any other component, a fact demonstrated by the following percentages of lives of members of the armed forces sacrificed in ratio to population:

	Approximate population	Per cent
United Kingdom	47,000,000	.005
Canada	11,500,000	.003
Australia	7,250,000	.003
New Zealand	1,800,000	.005
South Africa	11,000,000	.0005
India	389,000,000	.00006

Besides those in the armed forces, the United Kingdom had these additional casualties:

	Merchant Navy ¹	Home Guard	Civilians	Total
Killed	30,189	1,206	60,585	91,980
Missing	5,264			5,264
Wounded	4,402 ²	557	86,175	91,134
Interned	5,556			5,556
Totals	45,411	1,763	146,760	193,934

¹ These figures include nationals of the Dominions, India, and the Colonies serving on British registered ships, but exclude deaths of nationals of the United Kingdom serving on ships registered outside the United Kingdom.

² The figure for internees includes those who were repatriated or escaped.

Kenya Colony and Protectorate	224,960 ¹
Tanganyika Territory	360,000 ²
Uganda Protectorate	93,981
Zanzibar Protectorate	1,020 ³
Total	679,961

Adding these casualties among the British Merchant Navy, the Home Guard, and civilians, the United Kingdom suffered a loss in deaths totaling 337,381, bringing the percentage of casualties to population to almost .007.

BRITISH EAST AFRICA. Four territories under British control in east central Africa, having differing constitutional forms and administrations. The total area is 679,961 square miles, and the population numbers 13,298,473. The territories comprise Kenya Colony and Protectorate, the latter being mainland possessions of the Sultan of Zanzibar extending inland for a distance of 10 miles; Tanganyika Territory, a mandate consisting of the greater part of the former German East Africa colony (Ruanda and Urundi provinces constitute a Belgian mandate); Uganda Protectorate, within which is the considerable native kingdom of Buganda; and Zanzibar Protectorate, which consists of Zanzibar, Pemba, and adjacent small islands.

Areas, populations, and capitals of the territories are as shown at bottom of page.

The territories possess 3,093 miles of railways, 27,607 miles of highways, and government-managed lake and steamer services over 3,853 route miles. While each component has its distinct administration, certain services are common to all or some of the territories. The Court of Appeal for Eastern Africa is composed of judges of the High Courts of Kenya, Uganda, Zanzibar and Tanganyika; the four territories have a common currency—the East Africa shilling of 100 cents; and their local defense force is the King's African Rifles. All four territories give financial support to Makerere College, in Uganda, which provides higher vocational education for Africans. The postal services of Kenya, Uganda and Tanganyika are unified (and have a single stamp issue). On Dec. 12, 1945, the British government announced that an East African High Commission is to be established, consisting of the governors of Kenya, Uganda, and Tanganyika, with the first-named as chairman; this body will have a permanent secretariat at Nairobi. Interterritorial Advisory Boards, with unofficial representation, are to be set up, and an East African Legislative Assembly, with representation of all races and of all three territories, is to legislate for the common services; the Tanganyika Railways are to be combined with the Kenya and Uganda Railways, and the Tanganyika customs department is to be amalgamated with the existing combined Kenya and Uganda customs department. The proposals do not involve closer political union or fusion of the three territories, in each of which the legislative councils will continue to function as at present. In London, there is a trade and information of-

fice representing the territories of British East Africa; and at Nairobi, a (British) Trade Commissioner.

The People.—The indigenous Africans, possessing differing racial origins and backgrounds, present a bewildering complexity of language, religion, and customs. Swahili (or Kiswahili) is the lingua franca, though some knowledge of English is gradually spreading. Most of the people in the coastal regions, and particularly the Arabs, are Moslems; Christian missions of several denominations work among the interior tribes, which are generally pagan. Large numbers of British Indians were brought to the country early in the century for railway construction, and their descendants, augmented by immigrants, are the principal shopkeepers in British East Africa. Arabs were first attracted to Zanzibar in slave-raiding days, and have remained as plantation owners and industrialists. Most white people are British or South African, though in Tanganyika Territory the unofficial element is principally German—in fact, there are now more Germans settled in the mandate than when the country was a German colony.

The populations of the territories are composed as shown at top of page.

During the war the territories also sheltered many thousands of Polish and Greek refugees, besides internees and prisoners of war. Naturalization was suspended in 1944, except in the cases of certain British-born women.

Elementary education is free, and is spreading in all territories. The governments operate separate schools for Africans, Arabs, Indians and white children; there are also Moslem schools, and a large number of schools conducted by missionary bodies are in receipt of state aid. In the large centers of population are a few secondary and technical schools; a practical agricultural bias is given to school teaching. In 1944 a five-year plan was adopted for increasing opportunities for the education of girls in Kenya Colony where, during the past 10 years, the number of them attending school has increased sixfold among the Arabs of Zanzibar, despite early marriage and the purdah of Moslem communities, schools for girls are also increasing in numbers. Basic English is making considerable headway in all schools. All four East African territories send students (including the king of Buganda) to Makerere College, Uganda, which it is planned to develop into an East African University.

Government.—The governors of the three mainland territories are as follows: Kenya Colony and Protectorate, Maj. Sir Philip Mitchell (appointed Dec. 12, 1944); Tanganyika Territory, Sir William Battershill (Nov. 15, 1944); Uganda Protectorate, Sir John Hathorn Hall (Dec. 19, 1944). Each governor is assisted by an executive council of officials and nominated unofficials, and by legislative councils. Unofficial members of the latter, in the cases of Tanganyika and Uganda, are also nominated. The Legislative Council of Kenya, however, comprises, in addition to 20 officials (11 ex officio and 9 nominated), 11 elected whites, 5 elected Indians, 2 Arabs (1 elected, 1 nominated), and 2 nominated representatives of the Africans (1 white, 1 African).

In Kenya and Tanganyika, native advisory councils are consulted in matters affecting Africans; in Uganda, local administration is largely entrusted to the *kabaka* (king) of Buganda, and in other areas to native rulers of lesser standing, all of them assisted by *lukikos* (native assemblies). Troops were called out to suppress rioting in a general strike in Buganda in January 1945, eight persons being killed; the cause of the strike was dissatisfaction with the *kabaka's* ministers, the senior of whom was deported in February pending the report of a commission of inquiry. The Sultan of Zanzibar (Seyyid Sir Khalifa bin Harub succeeded Dec. 9, 1911) signs decrees which become binding upon all persons when countersigned by the British Resident (Sir Henry Guy Pilling appointed July 17, 1941); the former presides over an Executive Council, and the latter over a Legislative Council of 14 (8 officials and 6 nominated unofficials).

Finances.—The revenues of the territories are derived from customs, licenses, taxes, court fees, and government-operated railways, steamer services, posts, and telegraphs; expenditures are principally devoted to education, public health, defense, agriculture, forestry, and public works.

	Revenue £	Expenditure £
Kenya Colony and Protectorate (1945-46) ¹	6,250,000	6,133,000
Tanganyika Territory (1944-45)	3,553,000	3,906,000
Uganda Protectorate (1944-45)	2,352,000	2,431,000
Zanzibar Protectorate (1944-45)	477,000	527,000

¹ All figures are estimates.

Development Schemes.—Down to March 31, 1945, East Africa received grants from the British treasury aggregating £2,779,837 under the provisions of the Colonial Development and Welfare Act, 1940. The principal expenditures were for education, housing and land settlement, agriculture and veterinary services, water supplies and irrigation, and communications and transport; lesser sums were provided for nutritional and social services, afforestation, industrial development, and telecommunications. Allocation of the grants between the four territories was as follows:

	Development £	Research £	Total £
Kenya Colony and Protectorate	984,000 ¹	47,450	1,031,450
Tanganyika Territory	282,090	58,708	340,798
Uganda Protectorate	1,306,050		1,306,050
Zanzibar Protectorate	97,614	3,925	101,539
Total	2,499,754	110,083	2,779,837

¹ £170,000 was a loan.

Defense.—Manpower, military and industrial, furnished by the East African territories for war purposes has been among the greatest in British Africa. The King's African Rifles, a white-officered native soldiery, is a permanent military force with peacetime stations in all four territories and also in Nyasaland. During the war, augmented by numerous additional battalions, the K.A.R. helped drive the Italians from the northern frontier of Kenya Colony, and then served through the successive campaigns in East and North Africa; sailing thence to India, it shared in the operations in 1944-45 which drove the Japanese from Burma. Kenya troops attack-

ing on the Indawgyi front in Burma in 1945 were joined by a gibbon ape which had deserted the Japanese position; he displayed an inordinate fondness for tea, and when cigarettes were lit for him he blew smoke rings through his nose with great expertness. Four Uganda soldiers of the Busoga district, captured by Rommel at Tobruk in 1943 and subsequently released from captivity in Germany, were repatriated in March 1945; they were welcomed by the governor, who gave each of them a personal gift of a bullock.

Production.—Because of both lowland and highland conditions, there are great varieties of climate and a resulting wide range of agricultural crops. All three of the mainland territories cultivate coffee, tea, wheat, corn (maize), and sugar. In Kenya there are 1,000 coffee estates under white management, 100,000 acres producing 300,000 hundredweight of coffee annually; wheat flour is now exported by Tanganyika, which imported two thirds of its requirements in prewar years. Since the occupation of the East Indies by the Japanese, cinchona has been cultivated in Uganda and Tanganyika, and pyrethrum (which also yields an anti-malaria drug) in the latter and in Kenya; in Tanganyika, 5,300 acres were under pyrethrum in 1945, treble the area three years previously. During the war the area under sisal was greatly increased in Kenya and Tanganyika, both of which countries also have large coconut plantations. A native engaged in tapping coconut trees for liquor near Dar es Salaam early in 1945 was chased by a group of lions and sought safety by climbing a tree; halfway up he saw a large cobra descending and, paralyzed by fear, he lost his hold and fell 40 feet to the ground. Men brought from their huts by his cries drove away the lions, killed the snake, and carried the victim to hospital.

Cotton is grown on a small scale in Kenya, but in Uganda it is the mainstay of the protectorate's economy; in 1944 the Uganda crop was 225,000 bales of 400 pounds, and the crop for 1945 was estimated to amount to 250,000 bales. Both Tanganyika and Uganda produce tobacco and peanuts; and barley, oats, and alfalfa are grown in Kenya and Uganda. Other products of Kenya include flax, rye, wool, and dairy products, while margarine is made from cottonseed and peanut oil, and vegetables are dehydrated for use by troops in the field. Kapok, sesame, cassava, and rubber are cultivated in Tanganyika; abandoned rubber plantations were rehabilitated in 1943-44, the output increasing six fold in 12 months. The Kenya government has opened an agricultural training school for ex-soldiers, and is prepared to grant loans to white veterans wishing to settle in the colony. Zanzibar grows (on 48,000 acres) more cloves than any other area in the world (export in 1943 was valued at £531,120). Shipping difficulties curtailed clove shipments, but there was an increased demand for the protectorate's copra and coir rope; fruit crops occupy 20,000 acres.

The forests in the central highlands of East Africa yield many timbers of commercial importance, including cedar (exported for the pencil industry), conifers, and hardwoods, the last principally olive. Timber production in Kenya in 1944 exceeded fourfold the annual prewar output; new plantings were three times as many as the trees extracted from the forests. Wattle established in plantations in Kenya provides a valuable export in its bark; beeswax, camphor, and mangrove bark are also obtained from forests in Tanganyika and Kenya.

Both the natives and white farmers in all territories possess large numbers of cattle; in Kenya, butter and cheese are manufactured in co-operative creameries. Kenya hides and skins are better shade-dried than any in East Africa; they are known in the leather trade as "mombasas," being named for the port of export.

The territories are rich in mineral deposits. Gold is mined in Tanganyika and Kenya (which are respectively the second and fourth largest producers among British colonial territories) and in Uganda (the protectorate's record nugget of 25 ounces was found in 1944); for the most part, the gold is obtained from reef mines. The largest diamond so far discovered in East Africa (120 carats, valued at £15,000) was found in 1945 in the Williamson mine of the Shinyanga district, Tanganyika; the African who found it, overcome by a reward of £20 and 15 head of cattle, disappeared after collecting the gift and has not since been seen. Mica and talc are mined in Kenya and Tanganyika; tin and phosphates in the latter territory and Uganda; and asbestos in Kenya and Uganda. Kenya also has valuable deposits of sodium carbonate, as well as silver, manganese, arsenical pyrites, cyanite, bentonite, and diatomite, all of which are mined; coal fields were opened in Tanganyika in 1944, and ochre and tungsten deposits are worked; wolfram is mined in Uganda. A five-year geological survey of southern Kenya was commenced in 1945. Only in Kenya has there been any industrial development, and that only during the war. Cardboard is now manufactured, and a good arrowroot is made from edible cannae, while the locally-mined diatomite is used as a basis for the manufacture of metal polishes and cleaning powders. Spinning and weaving were introduced into Kenya and Uganda as native industries in 1944; natives have long made jewelry, mats, and pottery.

Despite difficulties inherent in wartime conditions, the territories have enjoyed buoyant revenues and general economic prosperity. Statistics of overseas trade in 1942 are as follows:

	Exports £	Imports £
Kenya Colony and Protectorate	9,898,453	14,581,248
Tanganyika Territory	6,360,960	4,624,787
Uganda Protectorate	5,659,721	2,765,027
Zanzibar Protectorate	1,137,321	1,216,238

The principal imports are cement, china and glassware, textiles, metal manufactures, motor vehicles, and petroleum products.

Communications.—Railways in the mainland territories (there are none in Zanzibar) have an aggregate length of 3,093 miles. The main line of the Kenya-Uganda Railway, from the coast at Mombasa to Kampala, in Uganda, has a length of 879 miles; 10 branch lines, aggregating 746 miles in both territories, bring the system's total length to 1,625 miles. The railway administration also operates, but does not own, a line of 91 miles from the sodium carbonate deposits of Lake Magadi to Konza Junction. The Central Railway of Tanganyika extends 774 miles from the coast at Dar es Salaam to Ujiji, on Lake Tanganyika, whence is steamship communication with Albertville, a railroad in the Belgian Congo. Two branch lines aggregating 329 miles bring the total length of the system to 1,103 miles: from Manyoni to Kinyangiri (93 miles), an agricultural center; and from Tabora to Mwanza (236 miles), on Lake Victoria. A meter-gauge railway in Tanganyika also runs from the port of Tanga to Arusha (274 miles), a branch from

Moshi connecting with the Kenya-Uganda Railway at Kahe Junction. The administration of the Kenya-Uganda Railway operates 3,853 route miles of steamship services on Lakes Victoria, Kioga, and Albert, and on the upper reaches of the Nile. Vessels operated by the government of Zanzibar maintain connection between the main islands of the protectorate and Dar es Salaam; and others link Zanzibar with Mombasa.

Zanzibar has 243 miles of roads, and on the mainland are a total of 27,364 miles of highways (Kenya, 16,537 miles; Uganda, 7,827 miles; Tanganyika, 3,000 miles); about one fourth of the mileage is fit for motor traffic at all seasons of the year. The Uganda road system connects directly with Juba, in the Anglo-Egyptian Sudan, and with the highways in the Belgian Congo and French Equatorial Africa; but services in Uganda are operated by the Kenya-Uganda Railway administration. Kenya is to spend £400,000 on additional district roads during 1945-46. The Great North Road (928 miles in length), modernized during the war, extends from Northern Rhodesia to Nairobi, Kenya Colony, by way of Tanganyika; an extension northward through Uganda connects with Mongalla, in the Anglo-Egyptian Sudan. The mainland territories lie on the route of the Capetown-London air services operated under the auspices of the British and South African governments, and they also possess local air lines. Local radio stations take some of the programs broadcast from London; they are used, too, for messages from native leaders to East African troops on service in Burma.

WHEELER B. PRESTON,
Author and Publicist.

BRITISH GUIANA. A British colony on the northeast coast of South America, bounded on the east by Surinam, on the west by Venezuela, and on the north and northeast by the Atlantic Ocean. The area is 89,480 square miles, and the population was estimated in 1943 to number 364,694, nearly half of whom were East Indian immigrants or their descendants. In 1940 the United States secured on 99-year lease a site for a defensive base on the Demerara River, 25 miles from the sea and within 50 miles of Georgetown (pop. 72,360), the capital. A disastrous fire in the center of Georgetown on Feb. 23, 1945, did damage amounting to \$10,000,000; most of the leading industrial properties were destroyed, together with the notable museum of the Royal Agricultural and Commercial Society, which contained rare specimens of the colony's wild life. A governor (Sir Gordon James Lethem appointed July 4, 1941) is assisted by an Executive Council and a Legislative Council; the latter body, by an amended constitution which became effective in 1943, has 24 members, 3 of them officials and 21 unofficials (7 being nominated and 14 elected). Reduction in the qualifications necessary for the franchise and for membership of the Legislative Council was recommended in 1944 by a Franchise Commission. Budget estimates for 1945 anticipated revenue of \$11,181,939 and an expenditure of \$12,142,332; a total deficit of about \$2,000,000 included the cost of subsidization measures. The government gives financial support to 189 schools in settled communities (enrolment 60,021 pupils in 1943) and to 59 others in sparsely populated areas. In 1943, 192,733 acres were under cultivation, mainly planted with sugar cane and rice, lesser areas being devoted to coffee, cacao, rubber, bananas, corn, fibers, citrus, and other fruits. The principal crop is

sugar, the estimated production of which in 1945 was put at 146,662 tons. Rice is planted on 73,000 acres; about half of the average annual yield of 50,000 tons is available for export, though in the 1943-44 crop year rice shipments totaled only 19,980 tons. Drainage and irrigation have been undertaken on a considerable scale in order to increase the cultivable area. A new industry is the manufacture of food yeast and animal yeast, which are being made on an experimental scale at Plantation Leonora. Forests cover almost nine tenths of the colony, more than 64,000 square miles of which remain unexplored; trees of economic importance include the greenheart, mora, wallaba, simarouba, letterwood (leopardwood), and crabwood. Cattle in 1943 numbered 159,496, and there were 2,675 horses, 35,581 sheep, 12,940 goats, and 41,766 hogs. The colony is sixth among British colonies as a producer of gold, and a deep diamondiferous belt runs across almost the whole of the country parallel with the coast, 100 miles inland. Other minerals include bauxite, manganese, and mica. Total exports in 1943 were valued at £4,879,733, the chief commodities being sugar, rum, rice, balata, molasses, and lumber. Machinery, textiles, and foodstuffs are the principal imports, the total value in 1943 being £5,138,319. Modes of communication include 95 miles of railway, 472 miles of navigable rivers, 39 miles of canals, and 900 miles of highways. Internal telecommunications are good, and in 1945 radio-telephone service with the United States was established. Georgetown is served by British West India Airways and Pan American Airways. See also BRITISH WEST INDIES.

BRITISH HONDURAS. Situated on the east coast of Central America, 600 miles west of Jamaica, British Honduras has been a British colony since 1862. The area is 8,598 square miles, and the population was estimated in 1944 to amount to 63,311. Belize (pop. 21,367) is the capital; smaller towns include Corozal, Bengue Viejo, and El Cayo. The members of the Belize city council were elected by popular vote for the first time in December 1944. A governor (Sir John Adams Hunter's term was extended for two years from Feb. 25, 1945) is assisted by a seven-member Executive Council (3 officials and 4 nominated unofficials) and a Legislative Council with a membership of 14 (6 officials and 8 unofficials, 6 of the latter being elected); the Legislative Council was considering in 1945 the draft of a new constitution designed to increase its elected membership. Government revenue in 1943 amounted to \$1,877,843, expenditure being \$1,838,829; the public debt was \$2,291,161. There are 80 elementary schools, two of them conducted by the government and 78 in receipt of state aid; 5 secondary schools are also state-aided. The principal agricultural products are bananas and coconuts; in 1943 only 41,801 bunches of the former were exported, however, and exports of coconuts and copra represented 2,879,415 nuts. Grapefruit and cacao are also crops of some economic importance. The cutting and exporting of hardwoods, principally mahogany, has always been the major industry. Total exports in 1943 were valued at \$3,745,326, timber products accounting for some 80 per cent of this sum. Imports in 1943 amounted to \$5,686,070, about half the total value representing goods from the United States. The colony has 228 miles of roads fit for motor traffic at all seasons, 131 miles of the total having an asphalt

surface; the 1945 budget provided a record sum of \$225,000 for new highway construction, and \$103,000 for highway maintenance. A new airfield 8½ miles northwest of Belize was under construction in 1945. Air services connect British Honduras with the West Indies and with Honduras. See also **BRITISH WEST INDIES**.

BRITISH INDIA. See **INDIA**.

BRITISH MALAYA. A colony (including certain outlying islands) and protectorates in the Malay Peninsula; the former was under British administration, and the latter under British advisement, until occupation by Japanese forces, 1942–45. The total area amounts to 51,166 square miles, and the population was estimated in 1940–41 at 5,560,444. The Straits Settlements is a colony comprising four settlements: Singapore (including Cocos or Keeling Islands, and Christmas Island); Penang (including Province Wellesley); Malacca; and Labuan. The Cocos and Christmas islands lie in the Indian Ocean south of the Netherlands Indies, and Labuan is an island off the northwest coast of Borneo. Protectorates in British Malaya number nine: Perak, Selangor, Negri Sembilan, and Pahang constitute the Federated Malay States (the F.M.S.); and Johore, Kedah, Kelantan, Perlis, and Trengganu are commonly known as the Unfederated Malay States. Singapore is the capital of the Straits Settlements, the governor of which colony is ex officio high commissioner for the protectorates; the governor is also high commissioner of the state of Brunei, and British agent for the states of North Borneo and Sarawak, all three of which are in west and north Borneo (q.v.). Areas and populations of components of British Malaya are shown in the table below.

Component	Square miles	Population	Capital
Straits Settlements:			
Singapore (Singapore Island, 220 sq. m.; Cocos Islands, 1 sq. m.; Christmas Island, 60 sq. m.)	281	771,798	Singapore (769,216)

Total for British Malaya	51,166	5,560,444	

¹ 1941 estimate; ² 1940 estimate.

The People.—Less than half of the population of British Malaya are Malays. In December 1937, at which time the Asiatic population was estimated to amount to 5,112,000, 42.4 per cent of the total (2,169,000) were Malays; 41.3 per cent (2,114,000) were Chinese; 14.8 per cent (755,000) were Indians; 4 per cent (18,000) were Eurasians (of mixed Asiatic and European blood); and 1.1 per cent (56,000) were Asiatics of various other races. Those born in the Straits Settlements are British subjects, whereas those born in the protected states are British-protected persons. The European population, predominantly British, was estimated to number 28,211 in December 1938.

In the Straits Settlements the government-

operated schools give instruction in English, and other schools in the Malay language (the latter free); grants-in-aid are made to schools of both types conducted by missionary and other bodies. Government schools in 1940 totaled 250 (26 of them English), with 38,604 pupils (10,716 in the English schools); and there were 270 state-aided schools (34 of them English), with 41,474 pupils (16,975 in the English schools). The teaching staff in English schools comprised 948 Asiatics, 330 Eurasians, 232 Europeans and 35 Americans; and about 3,600 Malays and 4,000 Chinese constituted the faculties of the vernacular schools. In Singapore, higher education of university standard was provided at Raffles College and at King Edward VII School of Medicine. Vocational and industrial education was available at technical and trade schools. The educational system in the F.M.S. followed along the lines prevailing in the colony. English schools (government and state-aided) in 1940 numbered 49 (13,564 pupils), and vernacular schools 1,734 (145,392 pupils); the latter schools comprised separate institutions for Malays, Chinese, and Tamils (Indian).

Government.—The governor of the Straits Settlements was assisted by an Executive Council of 11 members (6 officials ex officio, 2 nominated officials and 3 unofficials); Malays, Chinese, Indians, and Eurasians, if British subjects, were eligible for membership as unofficials. The Legislative Council, over which the governor presided, comprised 13 officials and 13 unofficials; two of the latter were chosen by the British members of the chamber of commerce in Singapore and Penang, and the others—Europeans, Chinese, Indians and Eurasians—were nominated by the governor. Much local government in the colony (as in the protectorates) was in the hands of mu-

nicipal councils, harbor boards, education boards, and hospital boards; and advisory boards expressed the needs and views of the Chinese, Mohammedan, Hindu, and Sikh communities.

The federal legislature of the F.M.S. was termed the Federal Council; presided over by the high commissioner (or his representative, the chief secretary), it consisted of 15 officials and 12 unofficial members, all the latter nominated. Laws passed by the Federal Council required the assent of the rulers (sultans) of the four component states; in each state the sultan presided over a state council which consisted of Malay chiefs and officials and unofficials nominated by the ruler. Kuala Lumpur was the administrative capital of the F.M.S.

On Oct. 10, 1945, George Hall, colonial secretary, informed the House of Commons that British Malaya is to acquire a new constitutional status. The nine Malay states (four federated and five unfederated) and two of the settlements of the Straits Settlements (Penang and Malacca) are to be merged in a Malayan Union, the Singapore settlement being constituted a separate colony. Since, at present, the peoples of the settlements are British subjects and those of the Malay states have only the status of "protected persons," agreements will have to be reached with the sultans of the latter for creation of a Malayan Union citizenship. Sir Harold MacMichael is to represent the British government in negotiations with the rulers.

Public Finance.—The revenue of the Straits Settlements was derived from an opium monopoly, various licenses, and import duties on liquors, tobacco and petroleum; revenues of the protected states came from export duties on tin and rubber, from import duties, from opium and from land-sales. In Straits Settlements dollars (1 dollar = 2s. 4d., sterling) estimated revenue and expenditure in British Malaya was as follows:

	Revenue	Expenditure
Straits Settlements ¹	52,331,000	51,034,500
Federated Malay States ²	77,500,000	72,000,000
Unfederated Malay States ³	30,642,791	28,369,074

¹ 1942; ² 1941; ³ 1940–41.

In prewar British Malaya the sale of opium had been a government monopoly, policy having been to reduce consumption gradually with total prohibition as the ultimate objective. On Oct. 9, 1945, the British Military Administration announced the total prohibition of opium sale and consumption forthwith in Malaya and all British protected territories under its jurisdiction. Since success of the new policy depends upon effective control in other countries where the poppy is cultivated or opium marketed, the military administration sought the co-operation of the governments concerned.

Production and Trade.—Rubber was by far the most important agricultural product of British Malaya. In 1937 there were 3,302,170 acres under rubber in plantations, 1,275,822 acres being in small holdings and 2,026,348 acres in large estates; 75 per cent of the latter was owned by British, French, Belgian, and Danish companies, 16 per cent by Chinese, 4 per cent by Indians, and 5 per cent by other Asiatics. Some 70,000 acres were under oil palm, and there were numerous plantations of coconuts and pineapples. Rice, tobacco, and fruits were produced on a lesser scale. Malayan ports exported much rubber from the Netherlands Indies, Siam, Borneo, and French Indo-China in addition to produce of the plantations of British Malaya. Malayan rubber production in 1940 amounted to 539,665 tons, whereas the gross exports of rubber that year from ports of the peninsula amounted to 772,730 tons. Always the leading market for Malayan rubber, 57 per cent of the total exported in 1940 was taken by the United States.

Tin is the most valuable mineral, most of it won from alluvial deposits in the F.M.S. and smelted in the colony of the Straits Settlements. The smelters also treated tin ore from the Netherlands Indies, Siam, Burma, French Indo-China, Japan, Australia, and Africa. Tin exports (and re-exports) in 1940 totaled 130,930 long tons, 78 per cent of the shipments going to the United States. Iron ore was mined in Johore, Kelantan and Trengganu, and other minerals included coal

(one mine), gold, tungsten, bauxite, manganese, and ilmenite.

Total exports and re-exports in 1940 were valued at \$51,128,169,000, and imports at \$5830,255,000. One third of the imports were foodstuffs, principally rice, for consumption by the large immigrant population attracted to Malaya for work on the rubber estates. Other considerable imports were cotton piece goods, iron and steel manufactures, tobacco, sugar, and petroleum products. More than £100,000,000 of capital had been invested in British Malaya before the Japanese overran the country. The total trade of the peninsula was relatively immense; in 1926, a peak year, it exceeded that of all other British colonies put together, and in 1938 the total trade exceeded that of New Zealand and was more than half the trade of the Indian Empire.

Communications.—Railroads throughout the peninsula, having a total length of 1,068 miles, were operated by the government of the F.M.S. From the island of Singapore, the main line crossed the Johore Strait by causeway to Johore, traversed that unfederated state to reach the F.M.S., and continued along both coasts of the peninsula; both the east coast and the west coast lines connected with the railroad system of Siam. Highways suitable for motor traffic totaled more than 5,000 miles. Singapore was on the air transport route between Great Britain and Australasia. The peninsula possessed extensive internal and external telecommunications.

End of Japanese Occupation.—British Malaya was attacked by the Japanese on Dec. 8, 1941. The British had withdrawn to Singapore by Jan. 31, 1942, and that great city fell to the enemy on February 15. The Japanese set up in Singapore, renamed Shonan (Light of the South), a military administration of Malaya headed by a director general, with a governor appointed for each state. In 1943 the four unfederated states of Kedah, Kelantan, Perlis, and Trengganu were transferred to the rule of Siam, presumably as reward for that kingdom's co-operation during 1940–41, when Japan was effecting a bloodless penetration of neighboring French Indo-China; and at the same time the island of Sumatra, part of the Netherlands Indies, was annexed to "Japanese" Malaya. Japan attempted to impose a completely planned economy upon Malaya. All business and industry were conducted by a permit system, and by this means the control of economic activities, both large and small, passed wholly into Japanese hands. Great cruelties were perpetrated upon the inhabitants of Malaya, particularly upon the Chinese, who constituted half the population; it was reliably estimated that the Japanese put upward of 100,000 Chinese to death in cold blood in Singapore alone. With the fall of Singapore to the British in 1945, thousands of Malays, Chinese, and Indians were banded in a guerilla People's Army, and, led by British and Australian officers, they waged warfare upon the invaders throughout the occupation. British liaison officers, parachuted into the country from October 1944 onwards, furnished additional equipment and directed extensive sabotage, all activities being by then under the Southeast Asia Command of Admiral Lord Louis Mountbatten. Long before the capitulation of Japan, British agents in Malaya were able to cash their checks and I.O.U.'s at par with Chinese and Indian merchants, for these had been impressed with the recapture of Burma and the great successes of the Allies elsewhere.

On Sept. 2, 1945, after four days of negotia-

tions, Penang, high up on the west coast of Malaya, was surrendered by Admiral Vzulni, commander of the Japanese submarine and air base at that port, and a week later, when mine-sweepers had cleared the Malacca Strait, Port Swettenham and Port Dickson were reoccupied. British naval units dropped anchor in Singapore harbor on September 3, and the following day an agreement for occupation of the city was signed aboard the battleship *Sussex* by Lieut. Gen. Seishiro Itagaki, Japanese commander in chief in Malaya. First of the occupation troops to land on September 5 was the 5th Indian Division, composed of Sikhs and Gurkhas who had fought since 1940 in Libya, Italy, and Burma. Representatives of the United States, the Netherlands, Australia, France, and China attended the formal surrender ceremonies in Singapore's municipal building on Sept. 12, 1945, when Mountbatten received from Itagaki the capitulation of 85,000 Japanese troops in Malaya and another 500,000 stationed throughout Southeast Asia and the East Indies. Thus ended Japan's dream of a Greater East Asia Co-Prosperity Sphere which was to have embraced an area of 1,500,000 square miles, rich in natural products and inhabited by 128,000,000 people.

Singapore's naval base, which had been the headquarters of the Japanese Tenth Fleet, was

Group	Square miles	Population	Capital
Gambia:

Cameroons ³			
Total	372,674	21,329,328 (1943)	
British West Africa	496,525	27,493,838	

¹ Only 271 square miles is administered as a colony; 2,229 square miles is administered as part of the protectorate which, alone, is 25,440 square miles in area.

² British (mandated) Togoland.

³ British (mandated) Cameroons, statistically included with the protectorate, has an area of 34,081 square miles and population (1939) of 868,637.

found in ruins, the docks smashed from bombings inflicted by India-based Superfortresses and by British planes from Burma; United States naval supremacy had rendered the port almost useless to the enemy. Elsewhere in the city the damage had been negligible and civil officials who had landed with the troops went to work on the economic rehabilitation of the country. A British buying commission arrived to survey the effects of Japan's exploitation of her four-year monopoly, and rubber and tin experts studied the situation in their fields. The Japanese had cleared huge areas of rubber trees to plant food crops in an effort to make Malaya self-sufficient, and most of the mining equipment had been destroyed by the British managers before they left in order to deny tin to the invader. Restoration of normal production in Malaya might require two years to effect repairs.

BRITISH WEST AFRICA. Collective term for four groups of colonies and protectorates, and two mandated areas, bordering on the Atlantic Ocean and the Gulf of Guinea. The total area is 496,525 square miles, and the population is estimated at 27,493,838. The four groups of territories are, from east to west, Gambia, Sierra Leone, Gold Coast, and Nigeria. A governor heads each of the groups, which consists in each instance of a colony and dependent territory. In 1945, the functions of the West African Governors' Conference and of the Cabinet Minister Resident in West Africa were merged into a newly constituted West African Council, composed of the Secretary of State for the Colonies and the governors of the four colonies; this body, which has a permanent secretariat at Accra, Gold Coast, was to hold its first meeting early in 1948.

The four groups comprising British West Africa, their areas and estimated populations, are as follows:

The People.—The combined population of British West Africa is almost half that of the entire British colonial possessions. Negroes, who constitute the bulk of the people, speak some 40 principal languages. Most of them are pagans; about 8,000,000, chiefly in Northern Nigeria and Gambia, are Moslems; and less than 2,000,000 are Christians. In each colony are primary schools operated by the state; others (conducted largely by missionaries) in receipt of state aid; and, in Moslem areas, "Koran schools" where instruction is principally religious. Effective June 1, 1945, all primary schools in Bathurst, Gambia, were transferred from missionary to government management. Secondary education, while much less widespread than elementary, is on the increase. Freetown (Sierra Leone) Grammar School, celebrated its centenary in 1945. Higher education is obtainable in only a few instances. Fourah Bay College, at Freetown, is affiliated with the University of Durham, England. In 1945 a Day Training College for both men and women teachers was opened in Freetown, providing a two-year course, and at Kumasi, in the Gold Coast, a training school for female nurses was established in order to secure both com-

munity and hospital nurses. Most striking educational institution in British West Africa is the Prince of Wales College, at Achimota, seven miles inland from Accra. Achimota College is a coeducational boarding (residential) school with 700 pupils; all school grades are taught, teachers are trained, and some degree of university education given. Education of the highest technical quality has been adapted at Achimota to African conditions and requirements, the object being to make good citizens of Africa able to benefit a community whose development had been retarded. Two art museums were opened in Nigeria in 1945—at Benin, famous for its ancient brasswork, and Ife, where bronze sculptures have long been made. A Commission on Higher Education which visited British West Africa in 1944-45 recommended that Achimota College and Fourah Bay be raised to the academic status of university colleges, the latter institution, reorganized on a new site, to serve Gambia as well as Sierra Leone; for Nigeria, a new university college was to be founded at Ibadan.

Towns.—Ibadan, in Southern Nigeria, is the largest city in West Africa, its population of 390,000 exceeding that of Indianapolis. Kano, a mud-walled city in Northern Nigeria has 90,000 inhabitants; and Kumasi, capital of Ashanti, contains 45,000. The capitals of the four colonies are ports. In Nigeria, in addition to Lagos, important ports are Victoria, Port Harcourt and Calabar; Takoradi has replaced Accra as the chief port of the Gold Coast.

Government.—The governors of each of the four colonies, who also head the administration of the dependent territories, are as follows: Gambia, Sir Hilary R. R. Blood (appointed Dec. 24, 1941); Gold Coast, Sir Alan Burns (Oct. 1, 1941); Nigeria, Sir Arthur Richards (Dec. 18, 1943); Sierra Leone (Sir Hubert C. Stevenson (July 5, 1941). Each governor is assisted by an Executive Council composed of officials, ex officio, and nominated unofficials (the latter, in all instances except that of Gambia, including two Africans), and by a Legislative Council:

Territory	Legislative Council
Gambia	Includes 4 unofficial nominated members, 3 of them African.
Gold Coast	15 official, 14 unofficial (10 elected, 6 of the total being Africans).
Nigeria	30 official, 19 unofficial (10 of them Africans, of whom 4 are elected).
Sierra Leone	11 official, 10 unofficial (3 elected, and 6 of the total Africans).

New constitutions, both providing unofficial African majorities, were under consideration in the Gold Coast and Nigeria in 1945. In the case of the Gold Coast, it was proposed that there should be 18 elected and 6 nominated unofficials, official representation being reduced to 6 members; while both the colony and Ashanti would be represented, the governor would continue to legislate for the Northern Territories. Of the 49 members proposed for the new Legislative Council of Nigeria, 29 would be unofficial, 25 of them being African; by the inclusion for the first time of members from the Northern Provinces, the Legislative Council would be representative of the entire country. The nine African councilors from the Northern Provinces would be chosen from a bicameral Regional Council, the House of Chiefs nominating four from its own body, and the House of Assembly five. Already, in Northern Nigeria, administrative authority devolves upon the 13 principal native rulers—sultans and emirs; for example, the emirate of Kano (area, 12,000 square miles; pop. 2,250,000) maintains

its own treasury, law courts, and police force, and expends considerable sums on education, public health, agriculture, and forestry. Under the new constitution, the Western and Eastern provinces of Nigeria would also have regional councils, each unicameral and termed House of Assembly. The three regional councils of the country would discuss bills before they are submitted to the Legislative Council, and would have some measure of financial responsibility. Provincial Councils already exist in the Gold Coast, where native treasuries collect and disburse revenues; similar bodies in Sierra Leone and Gambia also give effect to the principle of "indirect rule," which exemplifies government of the people, by the people, for the people. About 3,000 British officials of all services are employed in the government of the four territories, the population of which numbers more than 27,000,000; higher grades of the administrative services, from judges to doctors, are increasingly filled by Africans, scholarships providing appropriate training for suitable candidates.

In 1945 the British government paid the sum of £11,420 to the Opobo chiefs of Nigeria which had been promised in 1892 if the heirs and successors of Chief Jaja kept the peace; half a century ago Jaja had been deported for acts of oppression against his own people. The most sensational trial in the history of British West Africa concluded in the Gold Coast in January 1945, when eight sons of the late Sir Ofori Atta (knighted during the First World War) were sentenced to death for ritual murder; in 1944, in accordance with ancient tribal custom, they had removed the heart of another chieftain and buried it with their father.

Finances.—The revenues of the colonies are derived from customs, railroad receipts, licenses, court fees, taxes, and posts and telegraphs; and expenditures are for education, public health, defense, agriculture, forestry and public works.

Territory	Revenue £	Expenditure £
Gambia (1944-45) ¹	370,000	366,000
Sierra Leone (1944-45)	1,657,000	1,677,000
Gold Coast (1945-46)	4,976,000	4,892,000
Nigeria (1944-45)	10,162,000	9,589,000

¹ All figures are estimates.

Development Schemes.—The revenues of the colonies sufficing for little more than the cost of recurring expenditures, the British taxpayer has found considerable sums for long-range schemes, which are financed under authority of the Colonial Development and Welfare Act of 1940. The many schemes covered by this expenditure are for such projects as teacher-training, the training of African agricultural and medical staffs, extension of the system of roads, medical and veterinary services, health schemes, water supply, drainage, irrigation, and scholarships for higher education. Allocations down to March 31, 1945, amounting to £8,678,454, were as follows:

	Develop- ment £	Research £	Total £
General	139,270	4,850	144,120
Gambia	151,499		151,499
Sierra Leone	610,450 ¹	12,600	623,050
Gold Coast	230,655	18,175	248,830
Nigeria	7,472,255 ²	38,700	7,510,955
Total	8,604,129	74,325	8,678,454

¹ £265,500 was on loan; ² £175,000 was on loan.

During 1944-45 grants to Nigeria included £1,810,000 for an extensive road-building program (48,000 miles of roads over 15 years) ultimately to cost £7,000,000, about half of which

will be contributed locally; £1,889,000 toward a rural water-supply program which will be completed in 1957-58 at a cost of £5,000,000; and £401,000 for the development of technical education, part of an 11-year scheme to 1956 which will cost £952,497. Over the same period, Sierra Leone's grants included £93,000 for anti-malarial measures; and the Gold Coast received £96,000 to provide scholarships for the higher education and professional training of Africans—tenable at Achimota College and subsequently in Great Britain.

Defense.—Internal security and order is maintained by local police forces, the personnel of which is almost wholly African. Military defense of the colonies is provided by the Royal West African Frontier Force; it comprises numerous battalions of Africans, on long-term voluntary enlistments, recruited in all four colonies. During the Second World War the strength of the R.W.A.F.F. was increased to more than 100,000 men; after serving with distinction through the campaigns in Italian East Africa, the R.W.A.F.F. proceeded to India, and in 1944-45 participated in the operations to expel the Japanese from Burma. Parties of leading chiefs from all four territories were flown to Burma to visit the soldiers, and in order to ensure that the latter received mail, wives drawing allotments of pay at home had to present to disbursing officers letters written on their behalf to their husbands. Soldiers of a West African division guarding their camp in Burma one night in 1945, heard loud crashing from the jungle; it was caused by a domesticated elephant which had walked out on the Japanese and, wanting to be friendly, then crossed into the British lines.

Production.—All four of the territories produce palm oil and palm kernels for export (during the war supplying 40 per cent of the fats of the British fats ration), and all except Sierra Leone do a large trade in hides and skins. Nigerian hides are the most satisfactory in quality of the African hides exported; they are usually arsenicated to guard against insect attack during transit. Goat-skins are more highly valued than Nigerian sheep-skins by United States leather manufacturers. Cocoa is grown on a large scale in the Gold Coast, and to a lesser extent in Nigeria; their combined production represents about half the world's output (French West Africa and Brazil are the other biggest individual producing areas). The British government proposed to set up, with effect from October 1945, organizations to purchase, at its own fixed price, the total production of cocoa in the Gold Coast and Nigeria, and to market it. This contemplated producer-controlled monopoly (there being no consumer representation in the organization) was much attacked, particularly by United States cocoa importers and chocolate manufacturers, as the beginning of a cocoa "cartel." The logging industry of the Gold Coast had a record production in 1944, 2,000,000 cubic feet of mahogany logs being exported. A new electrical process for the coagulation of rubber latex, invented by two South Africans, was adopted during the war in Nigeria, the Cameroons, and the Gold Coast (and also in the Belgian Congo and French Equatorial Africa). The Gold Coast and Sierra Leone cultivate kola nuts on a considerable scale, and the former exports copra and lime products; while ginger and piassava come from Sierra Leone. Beeswax is exported from the Gambia, and that colony, and also Nigeria, have a large trade in peanuts; from Nigeria come cotton

lint, bananas, benne seed, and gum arabic. The Gold Coast now grows half her annual requirements of rice, and cultivation of the soybean has commenced on an experimental scale. In Gambia, yam flour is a new product for native diet, while vinegar is now being made from palm wine, and also from bananas.

Gold is produced in Nigeria, Sierra Leone, and the Gold Coast, the last being by far the largest producer in the British colonies; the Ashanti, or Obuasi, mine is one of the richest of the world's large gold mines, normally producing over 200,000 ounces a year from ore carrying nearly an ounce per ton. Before the war (current figures are not available) the Gold Coast was the world's third biggest producer of manganese, with an annual output of well over 500,000 tons, while Sierra Leone's hematite iron ore was being exported at a rate of over 600,000 tons annually. Nigeria produces tin, columbite, tantalite, and coal; a new coal mine was opened in the Eastern Province in 1944 at Nnewi. Diamonds are mined in the Gold Coast, and chrome ore in Sierra Leone; the world's biggest diamond (770 carats) was found in an alluvial deposit in the Gold Coast in January 1945. An entirely new development in the Gold Coast during the war was the mining of bauxite (the source of aluminum), for which purpose a railroad had to be built and roads made through the mountains; another new industry is the manufacture of lime from oyster shells of the fisheries at Kosive Duffor. The West African Institute of Industries, Arts, and Social Science, affiliated with the Prince of Wales College, Achimota, Gold Coast, provides advisory services to governments and others who are stimulating local industrial developments, tests local materials and improved methods of production, and provides advanced training for selected African craftsmen. The trade union movement has made considerable progress during the war, the West African Trade Union Congress having been organized and affiliated with the T.U.C. of Great Britain. Labor advisers attached to the West African governments are recruited from the ranks of British trade unionists.

External Trade.—War conditions have greatly affected the overseas trade of British West Africa. While there was necessarily a considerable reduction in tonnage, the rise in prices much increased values.

Territory	Exports £	Imports £
Gambia ¹	205,614	1,241,839
Sierra Leone ²	1,592,608	3,814,391
Gold Coast ¹	11,800,000	7,680,000
Nigeria ³	9,000,000	10,400,000

¹ 1943; ² 1941; ³ 1942.

The principal imports are cotton piece goods, apparel, iron and steel manufactures, petroleum products, chemicals, liquors, bags and sacks, and cement.

Currency.—The West African Currency Board controls currency in all of the four colonies. Standards are British, with notes for £1 and 10s., and coins, of alloy or nickel, for values ranging down to one tenth of a penny. The circulation of notes and coin on June 30, 1944 amounted to £26,378,126.

Communications.—Railroads with a total length of 3,145 miles operate in Sierra Leone (314 miles), the Gold Coast (490 miles), and Nigeria (2,341 miles); there are no railroads in Gambia, passengers and heavy freight being carried on inland waterways by steamers and launches.

Highways in all colonies usable by wheeled transport total 29,754 miles, Sierra Leone having 998 miles, the Gold Coast 6,610 miles, Nigeria 21,277 miles, and Gambia 869 miles. The southwestern part of the Gold Coast was opened up in 1945 with construction of a road from Esiamia to Half Assini; and a new road was built in Ashanti to link Kumasi with Bibiani. In 1945 an extensive road-building program was undertaken in Nigeria to link the territory with the All-Africa Highway; the latter, extending from the Cape of Good Hope to Algiers, is to be completed in 1958-59. War needs have given a great impetus to construction of airfields in British West Africa; by 1945 there were more than 50 airfields suitable for the heaviest planes. Gambia has been selected as the location of a great airfield in the postwar British airways system; the government offices and other buildings in Bathurst will have to be removed to provide the site. There is an extensive system of inland telecommunications, land wire and wireless; and external communications by cable and wireless are plentiful. The colonies possess numerous radio broadcasting stations. Nigeria has four daily newspapers, as has also the Gold Coast, while two are published in Sierra Leone; with one exception, all of them are Negro enterprises. In addition, there are a number of all-African weeklies and bi-weeklies. See CAMEROONS; TOGO.

BRITISH WEST INDIES. Island groups in the Caribbean area constituting six British colonies. The total area is 12,243 square miles, and the population numbers approximately 2,436,261. The colonies are as follows:

Colony	Square miles	Population	Capital
Bahamas	4,404	73,217	Nassau (20,000)
Barbados	166	200,764	Bridgetown (70,500)
Jamaica	4,450	1,237,391	Kingston (108,973)
Leeward Islands	422	100,447	Saint John (10,000)
Trinidad and Tobago	1,980	546,088	Port of Spain (105,195)
Windward Islands...	821	278,444	Saint George's (5,000)
Totals	12,243	2,436,351	

In consideration for the transfer of fifty 20-year-old destroyers to Great Britain in 1940, the United States obtained on 99-year lease naval and air bases in the Bahamas, Jamaica, Leeward Islands, Trinidad, and Windward Islands.

The white population, mainly British but including many of French and Spanish descent, comprises but a small proportion of the inhabitants. Negroes and colored people are in the majority, though in some colonies, notably Trini-

dad, there are large numbers originating in British India or in China.

British Guiana (where there is also a United States base) and British Honduras, mainland colonies in the Caribbean, are considered for some purposes as within the British West Indies. They were so regarded by Oliver Stanley, secretary of state for the colonies, when, in March 1945, he addressed a letter to the governors of the eight colonies urging upon their peoples consideration of the advantages of political federation. Greater economic stability would result from union of the colonies, administrative costs would be reduced, and efficiency increased; and the federation could anticipate an eventual status of self-government comparable to that of a dominion. In some instances, notably in the Bahamas, there was considerable objection to the project, but on the whole it was well received.

Meanwhile discussions are proceeding for effecting a unified West Indian currency, a customs union, uniform quarantine regulations, and a unified radio service. In 1945 a Department of Civil Aviation was set up for the entire Caribbean area, and government subsidies enabled British West Indies Airways to expand its services during the year. The commission on higher education, under Sir James Irvine, which visited the Caribbean in 1944, recommended in its report the next year that a University of the West Indies be established in Jamaica (q.v.). Matters of common concern to the West Indian colonies and to United States territories in the area are considered by the Anglo-American Caribbean Commission (q.v.).

Sir J. S. Macpherson, British co-chairman of the Anglo-American Caribbean Commission, is also comptroller for development and welfare for all the British West Indies. With headquarters in Jamaica, he supervises the development schemes, research work, and improvement of health and educational facilities made possible by grants and loans provided by the British taxpayer under the terms of the Colonial Development and Welfare Act, 1940. Down to March 31, 1945, the West Indies received a total of £8,690,113 (£7,366,591 in grants and £1,263,492 as loans for 291 schemes of development and welfare; and £60,030 in grants for 9 schemes of research work), the allocation being as shown below.

A new Colonial Development and Welfare Act which became effective April 25, 1945, more than doubled the sums made available by Great Britain, and extended the date of the schemes to March 31, 1956.

Particulars of government, education, trade, and communications are given in separate articles on the various colonies.

Territory	Development and welfare			Research		Total £
	No. of schemes	Grants £	Loans £	No. of schemes	Grants £	
General	22	312,925	4	41,130	354,055
Bahamas	1	3,450	3,450
Barbados	12	324,700	45,742	1	1,700	372,142
British Guiana	46	700,858	345,180	2	9,000	1,055,038
British Honduras	13	409,145	409,145

Windward Islands*	71	1,442,057	44,454	1,486,511
Totals	291	£7,366,591	£1,263,492	9	£60,030	£8,690,113

* The Leeward Islands and the Windward Islands share jointly in 8 of these schemes.

BRITISH WOMEN IN THE WAR. The women of Great Britain both participated in and were affected by the momentous events of 1944-45. When the end of the war with Germany came on May 8, 1945, the womanpower of the nation, mobilized at extraordinary levels for 4 years, was actively functioning in the vast war effort. It continued to be essential to the end of the Japanese war and in the subsequent reconstruction. Official data show that of the total woman population aged 14 to 59 of over 16 million, 6.8 million were in the national service of the country in May 1945, including 1,539,000 in munitions work, and 445,000 in the armed forces. Women constituted 34 per cent of all munitions workers and 40 per cent in other industries.

Before May, the chief policy changes affecting women were the compulsory sending overseas of women in the Auxiliary Territorial Service and the return of workers who had been released from the shoe and clothing industries earlier in the war under concentration schemes. Skilled ex-operatives were interviewed and asked to return to the industry from their war jobs.

Following V-E Day the stringent measures affecting women were relaxed. Various groups of women could now leave employment if they wished—all women over 60, women over 50 unless individually essential to production, any women, married or single, with household responsibilities, and married women joining husbands released from the services. Women over 40 would generally no longer be called for interview, while women working away from home for 3 years or more would be allowed if possible to transfer nearer home. However, with the new exception of certain professional work, women from 18 to 40 still could be hired only through employment exchanges.

In August 1945 it was announced that releases from the forces by the end of the year would include 100,000 women. With the beginning of the reconstruction period, plans were made to accelerate transfer of workers from the contracting munitions industries and from the forces to the textile, clothing, footwear, and food industries, all important woman-employers.

The period under review saw considerable interest in programs important for postwar readjustments, some particularly concerned with women. A Royal Commission on Equal Pay began its meetings in October 1944. "Equal Pay," however, remained far from achievement despite wartime pressures. A survey, by the National Shop Stewards' Council, of over 30,000 women in 58 factories showed that nearly 12,500 were doing men's work, but only about 2,000 were receiving the full men's rate. Women's average weekly earnings in important British industries in January 1945 amounted to but 63s. 2d. compared with 119s. 3d. for men.

Another fundamental problem involved improving conditions in the industries from which many women had gone into the better-paid war industries with their superior working conditions. Two thirds of the women participating in a survey by the Amalgamated Engineering Union wished to remain in engineering after the war, though only about one fifth had been in the industry before the war. Domestic workers especially showed little interest in returning to their former occupation. To improve the domestic employment field a government White Paper proposed formation of a National Institute of Houseworkers which would supply competent workers and adopt regulations for minimum wages and conditions of work.

Advances for women in social and economic spheres in 1944-45 included establishment of wage boards in the restaurant and other food service industries, allocation to the mother of family allowances (payable to 2.6 million families with 2 or more children), government encouragement of opening London medical schools to women, and the election of two women scientists as fellows of the Royal Society. The trade-union woman received recognition in the government-sponsored exchange visits of eight British and American women trade unionists engaged in the electrical, hosiery, clothing, and metal industries.

In July 1945, in the first elections since before the war, 24 women obtained seats in Parliament. Of these, 21 were Labor seats and one each Conservative, Liberal and Independent. Miss Ellen Wilkinson was appointed minister of education in the new Labor Cabinet.

Women's Bureau, U. S. Department of Labor.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in economics and government. It maintains a division of training for advanced research but the granting of fellowships for such, suspended during the war, has not been resumed. During 1945, the institution conducted a number of research studies which were published under the following titles: *International Tribunals: Past and Future*, by Manley O. Hudson; *Labor Policy of the Federal Government*, by Harold W. Metz; *Postwar Fiscal Requirements*, by Lewis H. Kimmel and associates; *Debtor and Creditor Countries, 1938-1944*, by Cleona Lewis; *Should Price Control Be Retained?* by Harold G. Moulton and Karl T. Schlatterbeck; *Business Leadership in the Large Corporation*, by R. A. Gordon.

The institution is supported from endowment funds and annual grants from philanthropic foundations. The officers of the board of trustees for 1945-46 were: Chairman, Dwight F. Davis; vice chairman, Dean G. Acheson; president, Harold G. Moulton; vice president, Edwin G. Nourse; treasurer, Henry P. Seidemann; and secretary, Elizabeth H. Wilson. Headquarters are at 722 Jackson Place, Washington, D.C.

BROWN, Mary Agnes, lieutenant colonel in the United States Army's Women's Corps, who on Aug. 25, 1945, was named adviser to Gen. Omar N. Bradley, chief of the Veterans' Administration, on all matters dealing with women veterans. A native of Washington, D. C., and a graduate of George Washington University, Lieut. Col. Brown had a record of 22 years' service with the Veterans' Administration before she entered the Women's Army Auxiliary Corps in 1942. For 12 years, she was executive secretary to the administration's medical director; became an attorney during this period; and then for 10 years, held a position in the solicitor's office of the administration. At the time she joined the army, she was president of the Women's Bar Association of the District of Columbia. She later served as executive officer to Col. Oveta Culp Hobby, former WAC director, and in March 1944, was appointed staff director at Gen. Douglas MacArthur's South Pacific headquarters. In that job she had the supervision of some 5,000 Wacs. On Aug. 28, 1945, she was awarded the Legion of Merit for her South Pacific service. She has also seen 8 months duty in Australia, 4 months in New Guinea, and 3 in Manila and Leyte.

BRUNEI. See BORNEO.

BRYAN, Charles Wayland, former governor of Nebraska: b. Salem, Ill., Feb. 10, 1867; d. Lincoln, Nebr., March 4, 1945. Brother and close associate of William Jennings Bryan, "The Great Commoner." Mr. Bryan himself had a long and distinguished career in the field of politics and public service. He was the Democratic nominee for vice president in 1924, and served as governor of Nebraska during the terms 1923-25, 1931-33, and 1933-35.

Mr. Bryan attended the University of Chicago and Illinois College at Jacksonville, and for several years thereafter was a traveling salesman. In 1891 he settled in Lincoln to become the political secretary and business agent of his brother. Ten years later, he assisted his brother in founding and editing *The Commoner*. Devoting much time and energy to civic matters in Lincoln, Mr. Bryan served as city commissioner, chairman of the park board, member of the Municipal Ownership League, and mayor for two terms, 1915-17, 1935-37. He won his first election for governor by a margin of more than 50,000 votes, and this evidence of his popularity, in addition to the prestige that the name of Bryan still possessed in the Middle West, was responsible for his nomination for the vice presidency in 1924, but the Democratic ticket was crushingly defeated by Coolidge and Dawes.

BUCKNER, Simon Bolivar, Jr., United States Army officer: b. near Munfordville, Ky., July 18, 1886; d. Okinawa in the Ryukyu Island chain, North Pacific Ocean, June 18, 1945. Commander of the United States Tenth Army, Lieutenant General Buckner was killed by enemy shell fire only a few days before he would have been able to add "conqueror of Okinawa" to his unofficial titles of "defender of Alaska" and "liberator of the Aleutians." The bitter Okinawa campaign was nearing its conclusion when he met his death.

The 58-year-old general led troops of the American Tenth for the Easter Sunday invasion (April 1, 1945) of Okinawa, strongest link in the Ryukyu Island chain joining Formosa (Taiwan) with Japan, and vital land, sea, and air base. The Okinawa landings marked the third time General Buckner had taken a major role in the Pacific war. Ordered to the North Pacific in the spring of 1940, he built Alaska's defenses, and in June 1942, parried the first Japanese thrust at the North American mainland with planes from his secret base west of Dutch Harbor, forcing Japanese forces to fall back on Kiska and Attu in the Aleutians. He later coordinated his army forces with the North Pacific naval forces of Vice Admiral Thomas C. Kinkaid for the 15-month Aleutians campaign.

Son of a Confederate lieutenant general, Buckner was educated at Virginia Military Institute, West Point, the Infantry School (Fort Benning), the Command and General Staff School, and the Army War College. He saw service on the Mexican border, in the Philippines, and with the Aviation Section of the Signal Corps in the First World War. Between the two wars, the majority of his assignments were administrative or teaching jobs at the various army camps and schools throughout the United States. He was promoted to the rank of lieutenant general (temporary) in May 1943, and in that same year, was awarded the Distinguished Service Medal for his successful organization of the Alaskan defenses. He began the organization of the American Tenth Army in June 1944.

BUCKWHEAT. According to the Department of Agriculture, the 1945 crop of buckwheat in the United States totaled 7,756,000 bushels, compared with the 1944 crop of 9,166,000 bushels and the 1934-43 average crop of 7,121,000 bushels. In 1945, Pennsylvania led in production with 2,460,000 bushels, followed very closely by New York with 2,244,000 bushels. Michigan was the third largest producer with 416,000 bushels.

BUCOVINA. See RUMANIA.

BUILDINGS ADMINISTRATION, Public. See FEDERAL WORKS AGENCY.

BULGARIA. This Balkan country has a prewar area of 39,814 square miles and a population of 6,308,000 (1940). It is a monarchy under a child king, Simeon II, operating under a Regency Council.

Production and Trade.—Eighty per cent of the population is engaged in agriculture; 40 per cent of the total area is arable, used mostly for grain crops, especially wheat. Beans, vegetables, and table grapes are also grown. During the war, through the annexation of Greek tobacco lands, Bulgaria became the largest tobacco grower in Europe, with an output of about 71,000 metric tons in 1943. Since the return of these lands to Greece, Bulgarian tobacco production has been reduced by half. Other industrial crops are sugar beets, cotton, hemp, flax, sunflower seed, and rose for attar. The livestock and poultry industries are widespread. Lignite coal is the only notable mineral produced, and the manufacturing of textiles is the chief industry. In the prewar years Bulgarian exports, consisting primarily of tobacco and foodstuffs, and imports, comprising metal and textile products, were being traded chiefly with Germany. During the war this trade was monopolized by Germany. Since the Russian occupation, the Bulgarian economy has been geared to meeting the Russian reparations payments and the needs of the Soviet armies. In September 1945 such reparations were reduced to ease the Bulgarian economic plight. Although the United States on March 29, 1945, lifted restrictions on commercial and business communications with Bulgaria, the Treasury has continued its freeze of Bulgarian assets in the United States.

In 1940 the railway system consisted of 2,212 miles of road. Bulgaria had also 493 miles of telegraph lines and 13,102 miles of telephone lines. The leva is the official monetary unit, highly inflated since 1939.

Principal Events in 1945.—During 1945, Bulgaria came more and more under the influence and control of Soviet Russia. Following the armistice, the Soviet armies occupied Bulgaria, and an armistice commission headed by a Russian general assumed responsibility for the administration of the armistice terms. Meanwhile, a provisional government, agreeable to the Soviets, had been organized under Premier Kimon Georgiev, leader of the newly created Fatherland front, and a new Regency Council was established.

The Georgiev government was composed of representatives of the Agrarian, the Union Zveno, the Social Democrat, and the Worker (Communist) parties. The Communists, although a small minority, have since exercised the real power, however. With the portfolios of Justice and Interior in their hands, they controlled the courts, organized a militia operating under their orders, and assumed control over press and radio. Then, according to reports, they proceeded to exterminate all political opponents through trials

in "People's Courts" and by other means. It is reported that between 1,500 and 2,000 persons, indicted as war criminals or collaborationists, have been sentenced to death, including Prince Cyril, brother of the late King Boris and regent before the armistice, and three former prime ministers: Bogdan Filov (Philoff), Dobri Boshilov, and Ivan Bagrianov. Although Soviet Foreign Commissar Molotov announced a policy of non-intervention in Bulgarian internal affairs, the Soviet occupation authorities have done nothing to interfere with the activities of the Bulgarian Communists. Until the autumn of this year, American correspondents were barred from Bulgaria and all events were masked by a heavy curtain of censorship, making it difficult to appraise the real situation in this Balkan country.

Meanwhile the government set August 26 as the date for election of members to Parliament, under a repressive electoral law which, critics charged, disfranchised many voters and intimidated the opposition. In protest, six ministers (one Independent, one Socialist, and four Agrarian), representing potentially the opposition parties, resigned. Taking cognizance of these developments, the United States and Great Britain finally agreed to take a strong stand against the Georgiev regime. On August 18, United States Secretary Byrnes informed Georgiev that the Bulgarian Cabinet was not adequately representative of all the important democratic elements in Bulgaria and that the special electoral law under which the scheduled elections were to take place would not ensure a free participation of all these elements. Said the secretary in his note: "In the opinion of the United States government, the effective participation of all important democratic elements in the forthcoming election is essential to facilitate the conclusion of a peace treaty with a recognized democratic government. The will of the majority of the people can be determined only if all the people are able to vote free from force and intimidation." Three days later, the British Foreign Minister Bevin characterized the Georgiev government as "totalitarian" and the present electoral law as inconsistent with the principles of liberty. "We shall not, therefore, be able to regard as representative any government resulting from elections," concluded Mr. Bevin. Notwithstanding Russian approval of the Georgiev policies, the stern warnings administered by Byrnes and Bevin had the desired effect. Soon after the delivery of the British and American notes, the Bulgarian Cabinet announced the postponement of the elections until November 18, and approved a series of measures intended to give legal standing to the four opposition parties and to permit free discussion and participation in the elections. The government also announced pardons for 302 persons sentenced by the People's Courts and the reduction of 401 sentences.

Still easily amenable to Russian direction, Bulgaria also sought to gain favor with Marshal Tito in the hope of avoiding the penalties of a defeated Axis partner and of strengthening its position in the Balkans. Following a visit to Tito early in the year, Premier Georgiev announced that a "fraternal treaty" had been signed with the Yugoslav government on Oct. 2, 1944. It was reported later that Georgiev had made overtures to Tito for Bulgaria's inclusion in a "Yugoslav Federative State." Both leaders also brought serious charges against Greece for alleged persecution of the Slavic minority in Greece, revealing a plan to create an "autonomous" Macedonia at the expense of Greek territory. These charges

were denied and the British expressed their opposition to any Bulgar-Yugoslav block that might prove a menace to Greece or to British interests in the Mediterranean.

In September, the Council of Foreign Ministers convened at London to draw up peace treaties with Bulgaria and with other German satellites. Soon the conference found itself in a deadlock, however, and it adjourned with no decisions taken.

BURKE, Thomas, English author: b. London, England, 1886; d. there, Sept. 22, 1945. Although Burke wrote poetry, literary criticism, and murder stories, he was best known for his stories of boyhood spent in the most squalid sections of London and his sketches of that city's Chinatown and its poverty-stricken inhabitants.

Burke sold his first short story when he was 16 years old, and for the next few years worked as assistant to a bookseller and in a literary agency. Publication of the short stories comprising *Limehouse Nights* in 1917 brought him fame and commissions from English and American editors which permitted him to devote all his time to literary work. *Limehouse Nights*, the author admitted, was "violent stuff, hastily written"; in certain quarters it was acclaimed as a penetrating study, while in others it was denounced as a falsely melodramatic picture of Limehouse life. In any case, it made the Limehouse area of London a famous tourist spot and provided D. W. Griffith with the story for his famous silent film, *Broken Blossoms*. Among Burke's other works are: poetry, *Verses* (1906), *London Lamps* (1917), *The Song Book of Quong Lee* (1920); fiction, *Whispering Windows*, *More Limehouse Nights* (1921), *Wind and the Rain* (1924), *Sun in Splendour* (1926), *East of Mansion House* (1926), *Flower of Life* (1929), *The Pleasantries of Old Quong* (1931), *Night Pieces* (1935), and *Murder at Elstree* (1936); and many books of essays.

BURMA. A British dependency in southeastern Asia. It was occupied by Japanese forces in 1942, and reconquered in 1944-45. The total area of 261,610 square miles comprises Burma proper (with the Chin Hills and Kachin Hill Tracts), 192,158 square miles; the Shan States, 62,335 square miles; and unadministered territory, 7,117 square miles. At the census in 1941 the population numbered 16,823,798, of whom about 85 per cent were Buddhists; besides Burmans, indigenous races were Karens, Shans, Chins, and Kachins, and there were also large communities of Chinese, Indo-Burmans, and Indians. Rangoon (pop. 498,369) is the capital, and other large cities are Mandalay (147,932) and Moulmein (65,506). Until April 1, 1937, Burma constituted a province of British India. Thereafter executive authority was exercised by a governor (Sir Reginald Hugh Dorman-Smith assumed office May 6, 1941), who was assisted by a Council of Ministers. Legislative authority was vested in a Senate of 36 members (18 nominated and 18 elected by the House of Representatives) and a House of Representatives of

132 elected members; a ministry of Burmese, headed by a prime minister (Sir Paw Tun in 1942), was responsible to the legislature for conduct of domestic affairs in all of Burma except hill districts in the northern and eastern parts of the country. On May 17, 1945, the British government published a White Paper outlining a plan under which Burma is to attain full self-government within the British Commonwealth. The emergency wartime system of government, broadened by appointment of an Executive Council of Burmans to advise and assist the governor, is to continue until Dec. 9, 1948. As soon as conditions permit, a general election will be held and government under the constitution which came into effect in 1937 will be restored. Then the Burmese people are to draw up their own constitution, which should "take into account not only the British but the other various types of constitution in democratically governed countries." The British government would continue to administer the Shan States and the tribal areas of the mountainous fringes of the country until they signify a desire for amalgamation with Burma.

There were 8,270 recognized colleges and schools with an enrolment in 1940 of 639,259, and 18,745 unrecognized institutions with 212,663 pupils. In almost every village a Buddhist monastery provides primary education. The University of Rangoon, with two arts colleges, was founded in 1920, a medical college and a teachers' training college being added later. There is also an intermediate college at Mandalay, a forest school at Pyinmana, an agricultural college and research institute and veterinary college at Insein. The ordinary revenue for 1941-42 totaled Rs 1,713 lakhs, while expenditures totaled Rs 1,828 lakhs. Chief agricultural products are rice, peanuts, corn, sesamum, cotton, beans, and tobacco. Cultivated area amounts to approximately 17,142,175 acres, of which 1,436,621 acres are irrigated. Rice is the principal export. The reserved forests cover 31,637 square miles, from which 307,997 tons of teakwood were taken in 1939-40. Mineral resources include petroleum, tin, tungsten ore, silver, rubies, jadestone, and wolfram. The output of petroleum in 1939 was 275,673,364 gallons. The tin output was 5,441 tons; tungsten ore, 4,342 tons. There are 1,019 factories employing 86,383 persons. Exports including re-exports, in 1940-41 had a value of Rs 55 crores 38 lakhs; imports Rs 29 crores 55 lakhs. There are 6,811 miles of surfaced roads and 5,661 of unsurfaced highways. The Irrawaddy is navigable for 900 miles, the Chindwin for 300 miles, and there are 60 miles of navigable canals. The railways, which are state owned, have a total length of 2,060 miles.

Reconquest in 1945.—Although the Japanese had been on the defensive since June 1944, only 10 per cent of the country had been regained by the end of the year. Early in 1945, however, disregarding previous practice of both combatants to suspend activities during the monsoon, Admiral Lord Louis Mountbatten opened a full-scale offensive, effecting numerous amphibious landings along the coast to parallel the advance of his Fourteenth Army through the jungles. Meanwhile, also, American engineers completed in January the road across the top of Burma into China, and this route, named for Gen. Joseph W. Stilwell, under whose auspices it had been built, greatly facilitated the supply of munitions to the armies of Chiang Kai-shek. The Chinese divisions serving under Mountbatten were then

returned to their own country, the campaign continuing with British and Indian troops aided by mountain tribesmen fighting as guerrillas under British leadership. American and British air forces gave close support to the ground troops, for long supplied entirely by air, attacking the enemy with such success that not one Japanese aircraft remained in Burma by May 1945. Besides men and supplies, mules, so essential for keeping supply lines open, were also airborne, those successfully completing drops wearing parachutist's wings on the brow band of their head collars; they were reported to have "enjoyed the trip," though the manner in which they expressed their pleasure was not indicated. On February 26, Pagan, the ancient town in the heart of the Burmese oilfields, was captured, and on March 9 the British soldiers came back to Mandalay. By the beginning of April, the Japanese Fifteenth Army had been virtually destroyed, and the Twenty-eighth, constantly on the retreat, was forced to yield Rangoon to Mountbatten's victorious men on May 3. After capture of the capital, the units of the United States Air Forces were transferred to China, air operations being continued by the British, Indian, Canadian, and South African personnel. At this stage Mountbatten was allotted an additional army, the Twelfth, thousands of the troops having been flown from England on a journey which took, including two 48-hour rest periods en route, seven days. At the height of the Japanese advance in 1942, some 4,000 of Burma's 17,000,000 people were co-operating with the enemy, who organized a so-termed "Burma National Army." British officers were parachuted into the country and lived with these Japanese-equipped troops in enemy-held territory after the fall of Mandalay, by which time the Burmans had become thoroughly disillusioned. Having received the good wishes of the Japanese at a farewell parade before "departing to defend Burma," the Burma National Army marched out and promptly took up positions alongside the British. Restyled the "Patriot Burmese Forces," the men, commanded by their own Japanese-trained officers, helped to drive the enemy from the Irrawaddy area and continued to serve loyally until the end of the campaign. In Burma, the Japanese suffered their worst defeat on the continent of Asia in this or any war. With their forces decimated by battle and disease, with their supply lines as far back as Bangkok hopelessly disrupted by constant air attack, after they lost Rangoon the Japanese attempted to fight their way back into Siam (Thailand). Several thousand of them were killed attempting to escape eastward across the Sittang River, and only cessation of hostilities in August saved the Japanese forces from complete annihilation. Formal surrender of Burma to the British Twelfth Army was signed by General Ichida at Rangoon at 12:15 P.M. on Sept. 13, 1945. Brigadier E. F. E. Armstrong took the surrender on behalf of Lieut. Gen. Sir Montague Stopford, commander of the Twelfth Army. Ichida represented Field Marshal Count Juichi Terauchi, supreme commander of the Japanese southern armies. In the course of the campaign 128,000 Japanese killed in battle were buried by the Allies, who also took 3,000 prisoners, while great numbers behind the enemy lines were killed by air power or died from disease or starvation; Allied losses in killed and missing amounted to 20,000.

BURNS. See SURGERY, PROGRESS IN.

BURROUGH, Sir Harold Martin, British Naval officer: b. July 4, 1888. In January 1945, Vice Admiral Burrough succeeded the late Admiral Sir Bertram Home Ramsay as naval commander in chief of Allied Expeditionary Forces under General Eisenhower. He had previously served as flag officer commanding the Gibraltar area, 1943-45. In November 1942, he directed Allied naval operations at Algiers. Admiral Burrough was educated at St. Edwards, Oxford, and trained aboard H.M.S. *Britannia*. In the First World War, he saw action at the Battle of Jutland as gunnery officer of H.M.S. *Southampton*. From 1930-32, he commanded H.M.S. *London*; from 1935-37, the 5th Destroyer Flotilla; and 1937-38, H.M.S. *Excellent*. He was with the British Admiralty from 1939-40 as assistant chief of the naval staff; in September of the latter year, he assumed command of a cruiser squadron in the Home Fleet. He was promoted vice admiral in 1943. In early May 1945, he was present at the signing of Allied terms of German surrender at Reims, France.

BURTON, Harold Hitz, United States Supreme Court justice: b. Jamaica Plain, Mass., June 22, 1888. Senator Burton was named justice of the United States Supreme Court on Sept. 18, 1945, to succeed Justice Owen J. Roberts, retired. Senator from Ohio from January 1941 until he assumed his Supreme Court duties, the 57-year-old Republican was a prominent member of the senatorial war investigating body which began its work as the Truman Committee. In March 1943, with Senators Ball, Hatch, and Hill, he brought out the famous B2-H2 resolution for international co-operation, designed to show the other United Nations that the United States Senate did not stand for isolationism. In February 1945, he fought for Senate approval of the Vandenburg plan for an Allied treaty to demilitarize Germany and Japan. He had but recently returned from the Mediterranean theater where he had helped conduct an inquiry into expenditures in North Africa and the Near East, as member of a subcommittee. In June 1945, Mr. Burton encountered bitter opposition from American labor groups when he joined Senators Hatch and Ball in introducing the Wagner Law revision bill, which called for liquidation of the National Labor Relations Board and the substitution of machinery to avert the "serious danger of a knock-down, drag-out fight between management and labor" in the postwar period of adjustment.

Although his political career has had its roots in Ohio, Mr. Burton is a New Englander by birth. His father was dean at the Massachusetts Institute of Technology and a member of the faculty for 40 years. Young Burton grew up in Newton, Mass., later attended Bowdoin College (A. B., 1909) and Harvard Law School. He was a corporation lawyer in the West, and in Cleveland, until he entered Ohio politics in 1929 as a member of the state's House of Representatives. He was director of law for the City of Cleveland, 1929-32; the city's acting mayor, Nov. 9, 1931-Feb. 20, 1932; and its mayor from 1935 to 1940. He entered the United States Senate in January 1941. In the First World War, he was first lieutenant, later captain of the infantry, and served in France and Belgium, 1918-19. He was awarded the Purple Heart and the Croix de Guerre. He edited *600 Days' Service—A History of the 361st Infantry Regiment, U. S. Army (1919)*.

BUSH, Vannevar, American scientist and electrical engineer: b. Everett, Mass., March 11, 1890. Dr. Bush figured prominently in the development of the atomic bomb, which saw its first use against the Japanese city of Hiroshima on Aug. 6, 1945, and contributed materially toward hastening the end of the Pacific war. Research begun by the government in late 1939 to investigate the use of atomic energy for military purposes was, by June 1940, being conducted under the direction of Dr. Bush, then director of the newly created National Defense Research Committee. (NDRC represented the first organized civilian attack on problems of research and development related to the war effort.) In 1941, his committee was absorbed by the new Office of Scientific Research and Development, and he was named OSRD director. In June 1942, OSRD's vastly expanded atomic research program was taken over by the War Department. Dr. Bush has also been chairman of the Joint Committee on New Weapons and Equipment of the Joint United States Chiefs of Staff since 1942, a unique post for a civilian to hold.

Dr. Bush has been president of the Carnegie Institution of Washington since 1939. In that same year, he was named chairman of the National Advisory Committee for Aeronautics; he resigned this position in July 1941 to devote his full time to the Office of Scientific Research and Development. Dr. Bush took his engineering degrees at Massachusetts Institute of Technology and Harvard University. In the First World War, he did research for the navy on submarine detection. From 1919-32, he was associate professor of electric power transmission, later full professor, at MIT; from 1932 to 1938, vice president and dean of engineering. Dr. Bush collaborated with Dr. Samuel H. Caldwell, chief of MIT's Analysis Center, in designing the differential analyzer for solving differential equations. This mathematical, electronic robot was extensively used by the United States Army and Navy in the Second World War to compute gun range tables and to solve difficult problems in fire control and radar-antenna design. With W. H. Trimble, Dr. Bush has written two technical books: *Principles of Electrical Engineering* (1923) and *Operational Circuit Analysis* (1929). In April 1945, he was one of six American scientists in whose honor the 1945 American Design Award and \$25,000 were given to the National Academy of Design. In July, he suggested in a letter to the White House that Congress establish a National Research Foundation to promote a national policy for scientific research and education.

BYRNES, James Francis, United States Cabinet official: b. Charleston, S.C., 1879. On June 30, 1945, Mr. Byrnes was appointed secretary of state to succeed Edward R. Stettinius in the Truman Cabinet; was unanimously confirmed by the Senate on July 2; and took office on July 3. Mr. Byrnes was one of the late President Franklin D. Roosevelt's principal advisers, and accompanied Mr. Roosevelt to Yalta for his final conference with Marshal Stalin and Prime Minister Churchill. He and Mr. Roosevelt became friends during the First World War, when Mr. Roosevelt was assistant secretary of the navy and Mr. Byrnes was a member of the House Appropriations Committee. Their friendship was renewed in 1933. A middle-of-the-road Southern Democrat, Mr. Byrnes at times differed with the late president on domestic policies. However, in the

early days of the Roosevelt administration, he helped to pilot through the Senate practically all the New Deal measures. He later took a prominent part in sponsoring the legislation repealing the neutrality act and providing lend-lease.

Mr. Byrnes was educated in the public schools of South Carolina. From 1900 until 1908, he was court reporter in his home state's Second Circuit Court, and during that period, studied law. He was admitted to the bar in 1903. From 1903-07, he was editor of the Aiken (S.C.) *Journal and Review*. From 1908-10, he was solicitor in the Second Circuit. Elected to Congress in 1911, he served as a member of the House until 1925, when he began the practice of law in Spartanburg, S.C. He was elected to the United States Senate in 1931. He

left the Senate 10 years later to become an associate justice of the United States Supreme Court. In October 1942, he resigned from the court to accept appointment as economic stabilization director. He left that post in May of the next year to assume his duties as director of war mobilization. Mr. Byrnes was prominently mentioned for the vice presidential nomination in 1940, and again in 1944.

Mr. Byrnes accompanied President Truman to the Potsdam Conference, July 17-Aug. 2, 1945, and in September attended the meeting in London of the Council of Foreign Ministers. He holds the Distinguished Service Medal, awarded him by President Truman for his two and one half years service as war mobilization director.

CALDER, Alexander Stirling, American sculptor: b. Philadelphia, Pa., Jan. 11, 1870; d. New York, N.Y., Jan. 6, 1945. A member of the National Academy, Mr. Calder had executed many works for monuments and public buildings in leading American cities. Mr. Calder studied at the Pennsylvania Academy of Fine Arts and in Paris. Among his many works are the two groups of statuary for the pedestals on the northern front of the Washington Arch in New York City; the Fairmount Park marble sun dial, the Swann Memorial Fountain, and the Shakespeare Memorial in Philadelphia; and a statue of Leif Ericson, presented by the United States to Iceland on the 1,000th anniversary of the Althing in 1932. His works received many prizes, and are included in the permanent collections of the Pennsylvania Academy of Fine Arts, the Smithsonian Institution in Washington, D.C., the Metropolitan Museum, and the Museum of Modern Art in New York City, as well as other important museums. Mr. Calder served as acting chief of sculpture at the Panama-Pacific Exposition, San Francisco, in 1915, and taught at the National Academy of Design and the Art Students League in New York City. He was elected to the National Institute of Arts and Letters in 1916, and became sculptor member of the Fine Arts Commission of New York City in 1937.

CALIFORNIA, Pacific state, United States; admitted to the Union Sept. 9, 1850. Population (1940): rural, 2,005,122; urban, 4,902,265; total, 6,907,387. Land area, 156,803 square miles, divided into 58 counties. Principal cities with 1940 populations: Los Angeles, 1,504,277; San Francisco, 634,536; Oakland, 302,163; San Diego, 203,341; Long Beach, 164,271; Sacramento, the capital, 105,958.

Chief State Officers, 1945.—Governor, Earl Warren; lieutenant governor, Frederick F. Houser; secretary of state, Frank M. Jordan; treasurer, Charles G. Johnson; comptroller, Harry B. Riley; attorney general, Robert W. Kenny.

Judiciary.—Chief justice of California's Supreme Court, Phil S. Gibson; associate justices, John W. Shenk, Homer R. Spence, Douglas L. Edmonds, Jesse W. Carter, Roger J. Traynor, B. Rey Schauer.

Legislature.—The state legislature (Senate, 40 members; Assembly, 80) meets biennially in odd years on the first Monday after the first day of January.

Education.—Schools maintaining kindergartens (1943-44),¹ 1,197; enrolment, 91,685. Elementary schools, 3,615; enrolment in regular classes, 756,855; in classes for the physically handicapped, 5,399; in special day and evening classes, 2,111. High schools, 585; evening high schools, 97; enrolment in regular classes, 437,510; in classes for the physically handicapped, 3,157; in special day and evening classes, 535,709. Junior colleges, 44; evening junior colleges, 14; enrolment in regular classes, 24,841; in classes for the physically handicapped, 5; in special day and evening classes, 88,659. There are 7 teacher training schools in the state. Total state appropriation to districts and counties for education (1943-44), \$79,325,290.60. State superintendent of public instruction, Walter F. Dexter. Education in California is compulsory for children between the ages of 8 and 16, full time; between the ages of 16 and 18, part time, unless a high school graduate.

Finances.—Following is a statement of California's finances for the fiscal year 1943-44², supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year July 1, 1943-June 30, 1944...	\$ 115,586,005.13
Receipts, 1943-44	1,211,587,581.42
Total	\$1,327,173,586.55
Disbursements, 1943-44	1,164,132,910.21
Balance, June 30, 1944	\$ 163,040,676.34

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the table on following page.

¹ Latest school year reported

² Latest fiscal year reported.

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.).....	2,458	2,211	2,278
Oats (1,000 bu.).....	4,376	5,310	5,115
Wheat (1,000 bu.).....	13,623	10,393	10,317
Barley (1,000 bu.).....	32,754	40,012	40,122
Sorghums for grain (1,000 bu.).....	4,592	3,920	3,737
Flaxseed (1,000 bu.)...	1,878	2,788	1,808
Rice (1,000 bu.).....	9,656	14,400	16,884
Sugar beets (1,000 short tons).....	1,991	1,197	1,615
Cotton (1,000 bales)...	424	327	396
Hay:			
Alfalfa (1,000 tons)...	3,304	4,106	4,213
Tame (1,000 tons)...	4,607	5,393	5,686
Walnuts (tons).....	53,320	62,000	62,000
Sweet potatoes (1,000 bu.)	1,299	1,200	1,080
Beans, dry edible (1,000 bags).....	4,634	3,843	3,967
Potatoes (1,000 bu.).....	18,787	33,250	37,365
Apples (1,000 bu.).....	7,607	6,144	9,240
Peaches (1,000 bu.).....	23,389	34,044	31,795
Pears (1,000 bu.).....	9,951	10,417	13,210
Grapes (tons).....	2,256,700	2,514,000	2,714,000
Oranges (1,000 boxes)*...	43,866	60,323
Grapefruit (1,000 boxes)...	2,337	3,505
Lemons (1,000 boxes)...	11,339	12,300
Figs (tons).....	42,000	54,200
Olives (tons).....	41,100	42,000

* No estimates given for 1945 citrus crops, as harvest did not begin until October.

CALLES, Plutarco Elias, Mexican politician: b. near Guaymas, Sonora, Mexico, Sept. 25, 1877; d. Mexico City, Oct. 19, 1945. The dominating figure in the Mexican political scene from 1924 until his break with former President Cárdenas in 1935, General Calles had served as president of Mexico from 1924 until 1928. Born of poor parents, General Calles was educated at the Colegio de Don Benigno López y Sierra, taught in the schools of Guaymas and Hermosillo, and was made a professor at the Colegio de la Moneda. He joined the revolutionary forces of Madero in 1910, and after President Díaz was overthrown, became a colonel in 1913 and a general the next year. In 1915 he was appointed provisional governor and military commander of the state of Sonora, becoming constitutional governor in 1918. The next year he was made secretary of industry, commerce, and labor, and when Gen. Alvaro Obregón was elected president in 1920, he was appointed secretary of the interior. As president, General Calles continued to carry out the agrarian and educational reforms initiated in 1917. During his administration there was a long and serious controversy with the United States regarding the application of the 1917 constitution to foreign land and oil properties, but an adjustment was finally reached in 1927 by Dwight W. Morrow, United States ambassador to Mexico. Early in 1926 the clergy took a positive stand against the unenforced religious and educational provisions of the 1917 constitution, which precipitated a bitter conflict between church and state. The government ordered the nationalization of church property and began to close church schools, while the clergy suspended religious ceremonies requiring the services of priests. In 1927 the religious revolt known as the Cristeros revolution broke out in several provinces, but General Calles succeeded in quelling this civil war. Although General Obregón (July 1-July 17, 1928), Emilio Portes Gil (1928-30), Pascual Ortiz Rubio (1930-32), and Gen. Abelardo Rodríguez (1932-34) succeeded him as president, General Calles remained the real power in the government. In March 1929, he took over command of the federal forces and broke the revolt headed by Gen. Gonzalo Escobar. He was appointed minister of war in 1931, and minister of finance

in 1933. At the insistence of Left wing elements, he instituted the Six-Year Plan of social legislation and economic development in 1933. He supported Gen. Lázaro Cárdenas for president in 1934, but soon after Cárdenas was elected, General Calles began to criticize his regime, and Cárdenas retaliated by purging the government of Calles' allies. On April 11, 1936, General Calles was arrested by order of President Cárdenas and deported to the United States. After the election of President Ávila Camacho, General Calles returned to Mexico on May 5, 1941, and a year later resumed his post in the army.

CAMBODIA. See FRENCH INDO-CHINA.

CAMEROONS. A British mandated territory in West Africa; with Cameroun (q.v.), it formed the greater part of the former German colony of Kamerun, which was constituted mandate territory of the League of Nations in 1922. (That part of Kamerun, 107,270 square miles, which France had ceded to Germany in 1911, was re-absorbed into French Equatorial Africa.)

The British Cameroons (area 34,081 square miles; pop., 1939, 868,637) lies along the eastern border of Nigeria, and is administered by the government of that country: the southern portion, known as the Cameroons Province, as one of the Eastern Provinces of Nigeria; and the northern part (geographically separated) with the Bornu, Benue, and Adamawa provinces of the Northern Provinces. Since 1942 the Cameroons has had a representative in the Legislative Council of Nigeria. The principal exports are palm oil and kernels, cocoa, rubber, and coconuts; and the chief imports are textiles, petroleum products, and cement. For statistical purposes, the Cameroons is treated as part of Nigeria (see BRITISH WEST AFRICA). Buea and Victoria are the ports of entry. A motor road was constructed between Victoria and Bamenda in 1944. At Bamenda, an administrative center in the interior, a native woman found in 1945, 16 bars of gold buried in her garden, supposedly hidden there during the First World War by Germans prior to evacuating the town.

CAMEROUN. A French mandated territory in West Africa, situated between the British mandate Cameroons (q.v.) and French Equatorial Africa; area, 164,097 square miles, population, 2,780,000, of whom more than 3,000 are whites. Administratively and financially Cameroun is autonomous, a high commissioner, with the status of governor, being assisted by an Administrative Council. Yaoundé, or Yaundé, is the capital, and Douala the principal port. The government conducts (1944) 110 schools with 29,000 pupils; there are agricultural and technical schools at Douala, and at Yaoundé are a high school and a school of medicine. State aid is given to 42 French mission schools and 157 foreign mission schools; the latter include schools of the American Presbyterian and Seventh Day Adventist missions. Palm oil is a staple of native diet, and the natives cultivate bananas, cassava, sweet potatoes, and sesame. There are plantations of rubber (3,000 tons in 1944), coffee (8,565 tons in 1943), and cacao (25,000 tons annually). During the war practically all export crops were purchased by the British government. Titanium (rutile) is the principal mineral exported (3,000 tons in 1943); tin, copper, gold, and molybdenite are also mined, and zinc, lead, columbite, tantalite, and wolfram have been located. During the first six months of 1944, 72,900 metric tons of prod-

ucts, valued at 353 million francs, were exported, and 29,400 tons of merchandise, valued at 272 million francs, were imported. Railroads aggregate 309 miles in length; the main line, from Douala to Yaoundé, is to be extended northward to Fort Lamy, near Lake Tchad (Chad). There are 2,700 miles of highways suitable for motor traffic at all seasons of the year, and 900 miles of dry-weather roads; a new road is under construction to link up with the All-Africa Highway, from the Cape of Good Hope to Algiers.

CAMP FIRE GIRLS, Inc. Founded by Dr. and Mrs. Luther Halsey Gulick, incorporated in 1912, the Camp Fire Girls is a character-building organization of over 350,000 girls. Types of membership include the Blue Birds (ages 7-10); Camp Fire Girls (ages 10-14); and Horizon Club Girls (girls in senior high school and junior college). The major activity of 1944-45 was the Hi, Neighbor! project, an adventure in neighborliness. During the Sixth War Loan drive, Camp Fire Girls sold \$2,437,500 worth of bonds—enough to purchase 1,250 field ambulances. As victory approached and the needs of countries already liberated became urgent, they devoted much of their time to work with various relief agencies, collecting clothing, books, toys, sewing supplies, and other necessities for children in China, England, Russia, and other Allied countries. Over 40,000 girls attended Camp Fire camps, filling them to capacity. The annual meeting was held Jan. 14-20, 1945, in New York City. The organization publishes *The Camp Fire Girl*, a monthly magazine (except for July and August); *Handbook for Guardians of Camp Fire Girls*; *The Book of the Camp Fire Girls*; *The Blue Birds Book*; *Horizon Club Program Book*, and other material.

Officers of the Camp Fire Girls, Inc., are: president, Dr. Bernice Baxter; executive secretary, Martha F. Allen. National headquarters: 88 Lexington Ave., New York 16.

CANADA, Dominion of. A self-governing state of the British Commonwealth of Nations, comprising the entire northern half of the North American continent, with the exception of the Territory of Alaska, which belongs to the United States, and Labrador, a dependency of Newfoundland. The present land area is 3,466,556 square miles and the population (1941 census) 11,506,655 (of whom 5,900,536 were male; 5,606,119 female). Executive power is vested in a governor general, appointed by the king on the advice of the Canadian ministry, and aided by a Privy Council. The Earl of Athlone was governor general in 1945, and William Lyon Mackenzie King was prime minister. Legislative authority is exercised by a Parliament consisting of a Senate of 96 members, nominated for life, and a House of Commons elected every five years, or less in the case of a dissolution by the ministry, the province of Quebec always having 65 members and the other provinces proportional numbers, according to their populations at each decennial census. The 19th Parliament, elected March 26, 1940, was composed of 245 members; the 20th Parliament, elected June 11, 1945, should have had 238, but the redistribution clause in the British North America Act to this effect had been suspended. The Dominion is composed of nine provinces, each having a separate legislature with a lieutenant governor, and the Northwest Territories and the Yukon Territory, governed by commissioners assisted by councils. See also under each province.

Population.—The population of Canada, at the censuses of 1941 and 1931, by provinces, was as follows:

Province	1941 Census	1931 Census
Prince Edward Island	95,047	88,038
Nova Scotia	577,962	512,846
New Brunswick	457,401	408,219
Quebec	3,331,882	2,874,774
Ontario	3,787,655	3,431,683
Manitoba	729,744	700,139
Saskatchewan	895,992	921,785
Alberta	796,169	731,605
British Columbia	817,861	694,263
Yukon	4,914	4,230
Northwest Territories	12,028	9,204

The leading cities are Montreal (pop. 903,007), Toronto (667,457), Vancouver (275,353), Winnipeg (221,960), Hamilton (166,337), Quebec (150,757), Edmonton (93,817), Ottawa (154,951), Calgary (88,904), and Windsor (105,311).

In 1942 live births totaled 272,313, or a rate of 23.4 per 1,000 population. In the same year, deaths from all causes totaled 112,978, or 9.7 per 1,000. Immigrants, during the fiscal year ended March 31, 1943, numbered 7,445, of whom 2,418 were from the United Kingdom, 4,827 from the United States, and 200 from other countries.

Education.—Enrolment in educational institutions in 1941 totaled 2,447,528, of which 2,082,487, were enrolled in the ordinary and technical day schools controlled by the provinces. A total of 93,944 were enrolled in evening schools, 23,568 in correspondence courses, 5,088 in special schools (schools for the blind, deaf, or mentally defective), and 6,468 in normal schools. Privately controlled schools had 89,798 enrolled in ordinary day schools, and 19,356 in business training schools. There were 17,425 enrolled in Dominion Indian schools. Preparatory courses for university and college had 19,885 pupils, 48,835 were enrolled in standard university courses, and 40,674 were taking other courses at the universities.

Religion.—The census of 1941 reported the population according to religious affiliation as follows: Roman Catholics, 4,800,895; United Church, 2,204,875; Anglicans, 1,751,188; Presbyterians, 829,147; Baptists, 483,592; Lutherans, 401,153; Greek Catholics, 185,657; Jews, 168,367; Greek Orthodox, 139,629; others, and religion not stated, 542,152; total population, 11,506,655.

Population Trends.—According to the 1941 census, the total population of 11,506,655 falls into three main groups:

Anglo-Saxons	5,715,904 or 49.7 per cent.
French	3,483,038 or 30.3 per cent.
Others, chiefly European	2,307,713 or 20.0 per cent.

These figures, however, give only part of the picture, for populations are not static and it is important to consider the trend of group statistics as well as their quantity at a given moment. Whereas the Anglo-Saxons constituted 60.55 per cent of Canada's population at the first federal census in 1871, they have now dropped to 49.7 per cent, and, that, in spite of the immigration of millions from the British Isles. The French, who were 31.07 per cent in 1871, are now 30.3 per cent, but have increased absolutely from 1,000,000 to 3,500,000 in 70 years without the aid of immigration. The "other groups" have risen, largely through immigration, from 8.39 per cent to 20 per cent, although most of the people in these newer communities are now Canadian-born. The Anglo-Saxons have become an actual minority in Canada.

Nor is this all. The Anglo-Saxons, who in 1931 constituted 52 per cent of the population, have for the past 15 years been contributing less than 40 per cent of the annual births in the country. In other words, only about 40 per cent of the Canadian children of school age are of Anglo-Saxon origin, and their adult generation will be correspondingly diminished. If such trends continue, a century hence will see them at perhaps 25 per cent of Canada's population. This trend towards group extinction is due simply and solely to the failure of the Anglo-Canadians to maintain a survival birth rate.

Economic Conditions and Finances.—The level of economic activity remained high during the early months of 1945, but the end of the war in Europe brought the apparent beginning of a drop in employment, preparatory to a period of reconversion. The seasonally adjusted index of employment for the first five months averaged 185.6 (1926 = 100), while June 1 showed a recession to 175.3. The drop was not uniform, however, for rubber products, textiles, printing and wholesale and retail trade remained steady, while electrical apparatus fell from 315.8 in January to 290.7 in June; iron and steel products fell from 315.9 to 273.4; and construction and maintenance from 119.6 to 103.2. By economic areas, the drop in employment was most marked in Ontario and Quebec, where the structure of war industry had shown the most phenomenal expansion. It is significant that the employment index in Windsor had reached 289.7, while that in Winnipeg had not gone beyond 151.3.

A striking feature of the first seven months of 1945 was the increase in the new business obtained by the construction industry. The Dominion-wide total for the period was \$226,200,000, an increase of 22.2 per cent over the same period in the preceding year. Supply of basic materials continued to be a problem during July, and manufacturers reported continued difficulty in obtaining adequate labor. During the month of July, the Department of Labour announced a scheme whereby men with two years' experience in the building or allied trades would be eligible for discharge from the armed services. The increased volume of construction had outstripped the supply of materials and skilled labor.

The total value of building permits issued by all municipalities during the first seven months was \$99,300,000, an increase of 29 per cent. The value of permits in 58 municipalities for the same period was \$70,900,000, while the value in the corresponding portion of 1944 was \$57,300,000. During the month of July, new construction of all types amounted to 78.4 per cent of all permits, while the percentage of new residential homes was 53.8 per cent. The permits issued in the first seven months of 1945 were greater than in any similar period since 1930.

Governmental controls over the cost of living held comparatively firm. With rents pegged and most commodities under a ceiling, the only real change lay in a slight seasonal fluctuation in the price of fresh vegetables and fruit. The cost of living index averaged 118.85 for the first six months of 1945 as compared with 119 for the corresponding period in 1944.

Deposit liabilities of the Canadian banks continued to increase. At the beginning of June 1945, total deposits were \$6,375,100,000, as against \$4,200,000,000 in June 1943 and \$3,100,000,000 in June 1942. Total bank assets were recorded at \$6,894,900,000, and total public note circulation at \$934,300,000, an increase of 380.9

per cent over the average of the period 1935-39.

Finance.—The ordinary expenditures of the Dominion government rose from \$240,000,000 for the first four months of the fiscal year ended July 31, 1944, to \$302,200,000 during the same period of 1945. The total special expenditures on the other hand showed a decline from \$1,193,000,000 to \$1,161,000,000. War expenditures receded in the same comparison from \$951,000,000 to \$664,000,000, while Mutual Aid showed an increase from \$240,000,000 to \$496,000,000. The Mutual Aid payments in the first four months of the previous fiscal year did not include disbursements of \$298,764,859, representing temporary advances to the Canadian Mutual Aid Board. The total cost of the war was announced as having been about \$17,000,000,000 up to mid-August 1945.

At the close of September, Finance Minister Ilsley forecast total expenditures of \$4,000,000,000 for the year following the Ninth Victory Loan (opened October 22d) and more than \$5,000,000,000 for the fiscal year ending March 31, 1946. He explained also that the Victory Loan, with a goal of \$1,500,000,000, would cover the government's borrowing requirements for a one-year period, and that there would be no loan in the spring of 1946. Previous loans had been launched at approximately six-month intervals. Of the \$4,000,000,000 which he forecast for the ensuing twelvemonth, about 30 per cent, or about \$1,200,000,000 would be for normal and continuing expenses. The balance would include the cost of demobilization and rehabilitation of servicemen, the cost of armies of occupation, and other postwar military expenditures and some cost of postwar reconversion. It would also include the amount to be voted under the new Export Credits Act, for loans to other countries, an amount which Mr. Ilsley described as "hundreds of millions."

"These are formidable figures," said Mr. Ilsley. "They show that the scale of our financial operations remains at the high levels achieved during the war. They make clear that the task of the Minister of Finance is still a difficult one. On the other hand, they mask to some extent the decline—the rapid decline—that is already occurring in the government's demands on the goods and services of the community."

Labor and Social Security.—From the peak of 1,916,688 registered employed in December 1943, the Canadian total sagged to 1,856,871 in June 1945. The weekly payroll remained fairly stable during these early months of the year, however, being \$60,504,000 in May 1945, as against \$60,069,000 in May 1944. Until mid-summer 1945, strikes were almost nonexistent. The number of employees involved, in June 1945, for example, was only 2,773, with a time loss of less than two days per man. This halcyon weather was suddenly followed by a tornado of strikes, many of them, like that of the Canada Packers' employees in August, being wildcat strikes by large groups of supposedly organized labor over whom their own union officials seemed to have lost all effective control. Still other strikes bore the aggressive pattern of some of the large industrial unions in the United States, demanding "52 for 40 or we fight", i.e., asking for the same wages for a reduced working week of 40 hours as had been paid in wartime for 52 hours, and this regardless of whether the cost structure of industry could bear the extra burden or not. The result of these outbreaks was the paradox of considerable unemployment and disruption of business at a time

when everything seemed set for the large scale production of peacetime commodities and when the available jobs were still in excess of the available labor.

Agriculture.—Cash income from the sale of farm products in Canada for the first half of 1945 was \$702,000,000, or about \$62,000,000 less than for the same period of 1944. The decrease was accounted for by lower levels in the three Prairie provinces and by a minor recession in Nova Scotia. The largest decrease occurred in Saskatchewan, followed by substantial decreases in Alberta and Manitoba. These declines were offset in part by increases in other provinces, which in Ontario amounted to nearly \$23,000,000, with the remainder of the provinces showing minor increases. Income in the Prairie provinces was down chiefly because of reductions in the marketing of wheat and hogs during the first half of 1945 as compared with unusually heavy marketings during the first six months of 1944. Prospects of seriously reduced crops indicated that the marketings for the last six months would be gravely lower than during the last half of 1944. Wheat marketings in the Prairie provinces during the period August 1, 1945 to August 16 were only 695,000 bushels, as compared with deliveries of 4,044,000 bushels during the corresponding period of 1944. The visible supply of wheat on August 16 was placed at 209,000,000 bushels compared with 296,000,000 bushels on the same date in 1944. For most products, 1945 proved a very poor year; for some it was calamitous. A bad spring cut down the crop of almost all fruits by from 50 to 80 per cent. Ontario's orchard crops were almost negligible, and the very small peach crop was further damaged by the Oriental fly. In Western Canada too, a long stretch of cold, wet weather in the late summer was disastrous in its effect on the grain harvest. Market garden crops were also seriously damaged, both in the East and in the West.

The index of cold storage holdings on August 1 was 141.5 against 155.6 one month before. The standing on the same date in 1944 was 187.1. The actual cold storage holdings, in pounds or dozens, were as follows:

Commodity	Aug. 1, 1944	Aug. 1, 1945
Creamery butter	52,962,000	55,226,000
Dairy butter	114,000	114,000
Cheese	60,772,000	66,373,000
Concentrated whole milk	40,853,000	51,914,000
Cold storage eggs	14,534,000	17,075,000
Fresh eggs	3,810,000	2,829,000
Frozen eggs	42,735,000	29,875,000
Poultry, dressed	10,077,000	5,953,000
Pork, grand total	60,179,000	28,233,000
Lard	17,726,000	1,740,000
Beef, grand total	20,341,000	13,933,000
Veal	6,391,000	5,641,000
Mutton and lamb	2,078,000	1,150,000

Forestry.—Operations in the Canadian newsprint industry during July were at the highest level for any month in over three years. The output was 270,640 tons as against 266,417 in June. The index advanced from 104.7 to 105.6. The outward shipment of planks and boards rose from 168,000,000 board feet to 182,000,000; while declines were shown, after seasonal adjustment, in the export of wood pulp and shingles. Timber scaled in British Columbia, in the last month for which figures are available, was 297,000,000 board feet, as against 274,000,000 in the same month of 1944.

Fisheries.—The pack of British Columbia salmon amounted to 910,804 cases up to August 18, 1945, which was the largest amount for the same period in the past six years. The increase

in the pack over the deliveries of one year earlier was about 50 per cent. Frozen fresh fish in storage on August 1, 1945 was 30,535,000 pounds as against 32,747,000 the year before; and the storage total of frozen smoked fish was 1,948,000 as against 2,230,000 pounds.

Mining.—The index of mineral production receded from 174.6 in June to 168.7 in July. The output of coal declined from 1,271,000 tons to 1,078,000 tons; the index dropping from 127.7 to 113.4. The June production of other minerals, with the June 1944 figures for comparison, are as follows:

Mineral	June 1944	June 1945
Copper	23,874 tons	22,190 tons
Nickel	10,187 tons	11,322 tons
Lead	9,872 tons	12,588 tons
Zinc	19,880 tons	21,735 tons
Gold	239,900 oz.	212,200 oz.
Silver	1,160,000 oz.	1,099,500 oz.
Coke	328,000 tons	324,000 tons
Petroleum	824,500 bbls.	672,900 bbls.
Natural gas	2,827,000 M cu.	3,452,000 M cu.
Gypsum	46,000 tons	104,000 tons
Feldspar	2,345 tons	3,490 tons
Salt (commercial)	27,649 tons	29,518 tons
Cement	995,000 bbls.	1,041,000 bbls.
Lime	72,947 tons	72,361 tons

Electric Power.—Available hydroelectric power in Canada is estimated at 25,439,000 horsepower at minimum flow, at 39,511,700 horsepower for six months in the year, and even at 51,350,000 horsepower at peak turbine installation. The turbine installation on Jan. 1, 1944, was 10,034,513 horsepower, or only 19.54 per cent of the possible maximum. More than one half of the power now generated is generated in the province of Quebec. Electricity produced in Canada in July 1945 amounted to 3,285,000,000 kw.-hr. (kilowatt-hour), as compared with 3,412,000,000 kw.-hr. in the preceding month and with 3,419,000,000 kw.-hr. in July 1944. For the first seven months of 1945, production was recorded at 23,957,000,000 kw.-hr., as compared with 23,678,000,000 kw.-hr. in the same period of 1944.

Manufacturing.—Declines were shown in the index of manufacturing production in July compared with the preceding month. Plans were announced for the early cancellation of war contracts upon the official surrender of Japan. Wartime production of Canadian shipyards passed the five million mark, more than ten times the output in the First World War. Since 1939 more than 1,100 naval and merchant ships were launched by Canadian yards in a program that cost \$1,000,000,000 and at its peak gave employment to 75,000 workers.

The index of tobacco was at a considerably lower level. Cigarettes available declined from 1,182,000,000 to 1,096,000,000.

Financing of new and used cars in the month of July showed a decline from the same period of 1944, with 2,554 cars for July 1945, financed to the extent of \$1,311,000, as compared with the July 1944 figures of 3,182 cars financed for \$1,385,856. This was a reduction of 20 per cent in the number of units and of 5 per cent in the amount financed.

Transport.—Statistics for Canada's railways show the maintenance of a very high level of activity:

All railways	June 1944	June 1945
Carloadings	315,000 cars	322,000 cars
Operating revenues	\$67,010,000	\$69,861,000
Operating expenses	\$49,504,000	\$52,478,000
Operating income	\$12,577,000	\$13,500,000
Tons carried	14,679,000	14,643,000
Number of ton-miles	5,457,000,000	5,919,000,000
Passengers carried	4,901,000	4,407,000
Total pay-roll	\$29,109,000	\$29,925,000
Number of employees	167,000	171,000

Over half of the railway mileage in Canada is owned and operated by the Dominion and provincial governments and the remainder by incorporated companies. The length of railways publicly operated is 23,600 miles; that operated by the incorporated companies is 18,739 miles.

Electric railways continue to be replaced by motorbuses, except in the larger cities. In centers where war industries are located, local passenger traffic has increased to unprecedented proportions, and peak loads have had to be spread out by staggering the working hours of factories and stores.

The Great Lakes and the St. Lawrence River form one of the busiest waterways in the world; and traffic through the canal at Sault Ste. Marie, Ontario, is greater than that through the Suez and Panama Canals combined. The total for this Ontario canal from July 1, 1944, to June 30, 1945, was 117,204,000 tons of cargo.

By declared government policy, Trans-Canada Air Lines are to be the sole transcontinental service and the sole Canadian agency in international air service. A number of lateral north-and-south independent lines have been consolidated in the Canadian Pacific Air Lines. The T.C.A. and the C.P.A., combined, carried around 211,000 passengers in 1943 and 6,100,000 pounds of mail. Whereas the T.C.A., however, carried 840,000 pounds of express, the C.P.A., serving especially the remote defense projects of the far northwest, carried over 9,000,000 pounds of heavy freight.

There are six telegraph systems in Canada, with over 380,000 miles of wires, and 3,209 telephone systems, with over 5,800,000 miles of wires. In addition to the nationally operated Canadian Broadcasting Corporation, there are, in the Canadian railway field, some 97 private commercial broadcasting stations.

Foreign Trade.—Canada's imports for the 12 months ended June 1945 totaled, exclusive of gold, \$1,693,064,000, as compared with \$1,759,921,000 during the previous twelve months. Of this, \$1,356,403,000, or more than four fifths of the total, came from the United States. Next highest came the United Kingdom, with \$122,551,000, or approximately 7.4 per cent of Canada's imports. Canada thus imports from the United States more than ten times as much as from any other country in the world. The United States is also Canada's best customer, since of Canada's export total of \$3,412,083,000 for the same period, \$1,281,764,000 (or 38 per cent) went to the United States and \$1,161,051,000 (or 36 per cent) to the United Kingdom. A large proportion of the exports to the United Kingdom, moreover, consisted of Canada's "mutual aid" gifts to Britain, while the exports to the United States were all (like Canada's imports from the United States) cash transactions. The positive balance of world trade in Canada's favor during the twelvemonth in question was \$1,766,528,000.

An analysis of Canada's exports for July 1945 will give some idea of the variety of the country's products:

(1) Agricultural products, total \$82,623,000, including fruits \$189,000, vegetables \$1,034,000, grains \$63,452,000 (including barley \$2,084,000 and wheat \$54,844,000), wheat flour \$8,434,000, alcoholic beverages \$1,534,000, and seeds \$432,000.

(2) Animal products, total \$31,656,000, including cattle \$844,000, fishery products \$8,452,000, furs \$2,634,000, raw hides \$40,000, unmanufactured leather \$334,000, manufactured

leather \$319,000, meats \$11,298,000, butter \$126,000, cheese \$1,919,000, eggs \$3,092,000.

(3) Fibers and textiles, total \$3,803,000, including cotton \$704,000, flax \$175,000, wool \$996,000, and artificial silk \$1,092,000.

(4) Wood and paper, total \$43,207,000, including planks and board \$9,147,000, square timber \$102,000, red cedar shingles \$644,000, pulpwood \$2,641,000, wood pulp \$9,403,000, newsprint paper \$15,163,000.

(5) Iron and products, total \$47,245,000, including pigs and ingots \$1,559,000, rolling mill products \$894,000, tubes and pipes \$218,000, farm implements \$1,978,000, hardware and cutlery \$377,000, machinery other than farm \$1,001,000, motor vehicles and parts \$30,788,000.

(6) Nonferrous metals, excluding gold, \$27,899,000.

(7) Nonmetallic minerals, total \$5,918,000, including coal \$335,000, petroleum \$1,538,000, and stone \$1,286,000.

(8) Chemicals, total \$7,494,000, including acids \$328,000, fertilizers \$1,541,000, and soda compounds \$568,000.

(9) Miscellaneous, including films, electrical energy, and certain military stores \$33,939,000.

After the United States and the United Kingdom, Canada's twenty best customers next in order in July 1945 were as follows (with comparative figures for July 1944):

Country importing from Canada	July 1945	July 1944
British India	\$36,772,000	\$19,091,000
French Possessions	5,401,000	3,180,000
Greece	4,151,000	853,000
Italy	3,995,000	4,052,000
Newfoundland	3,698,000	4,077,000
British South Africa	3,023,000	2,648,000
Netherlands	2,981,000
Australia	2,596,000	7,376,000
Brazil	2,559,000	699,000
Eire	2,293,000	1,529,000
New Zealand	2,244,000	239,000
Norway	2,147,000
Switzerland	1,475,000	347,000
Jamaica	1,442,000	2,162,000
Egypt	1,387,000	9,047,000
Russia	1,183,000	10,429,000
Trinidad	1,132,000	1,440,000
Mexico	845,000	371,000
Portugal	813,000	128,000
Ceylon	673,000	803,000

Many purely wartime variations occur in these statistics. Norway and the Netherlands, for example, were under Nazi occupation in July 1944, and hence Canada had no trade with them. Or again, the large exports to Soviet Russia in July 1944 were almost wholly "mutual aid" gifts to Stalin, and the drop to the trade status of Trinidad in July 1945 represents a move in the direction of cash trade. There were apparently no imports into Canada from Russia during the year under review.

The twenty countries from whom, after the United States and the United Kingdom, Canada bought most in July 1945, were as follows (with comparative figures for July 1944):

Country exporting to Canada	July 1945	July 1944
Newfoundland	\$3,345,000	\$1,352,000
British India	2,342,000	2,629,000
Venezuela	1,712,000	1,682,000
British West Africa	1,640,000	384,000
British Guiana	1,477,000	1,078,000
Colombia	1,464,000	1,071,000
San Domingo	1,040,000	882,000
Jamaica	950,000	1,191,000
Australia	946,000	1,597,000
New Zealand	852,000	691,000
Cuba	803,000	315,000
Mexico	726,000	1,283,000
Brazil	710,000	673,000
Trinidad	709,000	106,000

Eldorado Mine worker pours uranium ore concentrate into 100-pound bags for shipment to the refinery at Port Hope.

Polished section of piece of pitchblende ore showing fragments of brecciated pitchblende (light) in a matrix of later quartz.

Supplies were flown in by airplane to the 225 people who, isolated at Port Radium on Great Bear Lake near the Arctic Circle, worked the Eldorado Mine to produce pitchblende from which uranium, vital component of the atomic bomb, was obtained.

Courtesy Canadian Information Service

Country exporting to Canada	July 1945	July 1944
Honduras	640,000	86,000
Argentina	499,000	521,000
Ecuador	449,000	9,000
Switzerland	444,000	375,000
Barbados	304,000	680,000
British South Africa	301,000	271,000

Principal Events.—Five significant elections took place in Canada during 1945: a provincial election in Ontario on June 4, a federal election on June 11, a provincial election in Manitoba on October 12, one in Nova Scotia on October 22, and one in British Columbia on October 25. The Ontario election was precipitated when the Liberals, C.C.F.-Socialists and Communists, co-operated in making further administration impossible for the Progressive-Conservative minority government of the Hon. George A. Drew. The provincial Liberals had welcomed back into leadership the colorful "Mitch" Hepburn, whose powers of political invective were regarded as a campaign asset. However, his party was overwhelmingly defeated at the polls; and Mr. Hepburn himself was defeated in his home constituency of Elgin. The other chief challenge came from the C.C.F.-Socialists, whose provincial leader, Mr. E. B. Jolliffe, accused the Conservative administration of maintaining a "Gestapo" secret police to spy on its political opponents and so keep itself in power. The charge, however, reacted more strongly against the accuser than against the accused; and Mr. Jolliffe's party was snowed under at the election. A subsequent Royal Commission found the charges groundless; that the police branch in question, consisting ultimately of one detective only, was not of the political character alleged, but was rather a wartime counterespionage branch, set up in 1940 by the previous Liberal administration of Mr. Hepburn in order to investigate persons suspected of trying to undermine Canada's war effort. As for the Communists in the 1945 elections, only two of their candidates, Messrs. J. B. Salsberg and A. A. McLeod, were successful, their ridings being two predominantly foreign-language districts of Toronto. The general impression of the election was that the voters of Ontario wanted sound and stable government during the turbulent years of transition back to peace, and that they felt that only the provincial Conservatives seemed likely to supply it. Hence the resounding victory of Col. George Drew, whose party won two thirds of the provincial seats.

It is probable that comparable reasoning lay behind the results of the federal elections a week later, in which the Liberal government of the Rt. Hon. W. L. Mackenzie King was returned to power, although with a greatly reduced majority. Mr. King had been continuously prime minister for ten years, with a large majority, and many prophesied that popular discontent with war governments and their rigorous economic controls would sweep him out of office in this first election after V-E Day. The challenge came from the C.C.F.-Socialists under Mr. M. J. Coldwell and from the Progressive-Conservatives under Mr. John Bracken, both of whom forecast victory for their parties and both of whom apparently misgauged the realities of Canadian political life. The Liberal administration had already introduced so large a measure of social and socialist legislation (a national bank, family allowances, etc.) that the C.C.F.-Socialists felt themselves compelled to move farther Left in order to vindicate their separate identity;

and as a result they preached such an immediate and widespread program of Socialist expropriation that the Canadian electorate (still largely sympathetic with private ownership and free enterprise) took alarm and rejected the would-be innovators and their threatened intensification of economic controls. In all of Eastern Canada this group elected only one member, while in the West their representation was largely confined to the province of Saskatchewan, where a C.C.F.-Socialist legislature was already in control. The strategic error of the Progressive-Conservatives was of a different character. Looking about for an issue on which to fight the Liberals, they seized on Mr. King's manpower policy and his failure to enforce a more rigorous conscription program in the province of Quebec, which for strong historic reasons did not view the sending of Canadian troops abroad with the same fervor as did the more strongly Anglo-Canadian communities. When, after the victory in Europe and amid the general feeling in Canada that the remaining Japanese chapter, though bloody, was a small-scale affair, Mr. Bracken loudly demanded that Canadian conscripts (meaning the French-Canadians) be forcibly shipped abroad to do Canada's fighting in the Pacific theater, he completely alienated Quebec from his party, without winning over a commensurate share of the remaining electorate. In a country where less than one half of the population is of Anglo-Saxon origin, and where that Anglo-Saxon minority is divided in its political loyalty among at least three parties, the French, with one third of the country's population, are obviously in a position to hold the balance of power. Mr. Bracken thus deliberately began the electoral contest from minus seventy-five (the number of traditionally French constituencies in New Brunswick, Quebec, Ontario and Manitoba) and faced the almost impossible task of winning three quarters of the remaining 170 seats throughout the country if he were to secure a working majority. The chief result of the Conservative attack on the French (to whom the Conservatives themselves had given assurance in the 1940 wartime election that conscription for overseas service would never be invoked) was the massing of French support behind the Liberals, with a resultant victory for Mr. King. The Conservatives may have derived some emotional satisfaction from their campaign outburst against the French, but in their appeal to the animus of the Anglo-Saxon minority and in their apparent refusal to face the hard fact that it is a minority, they aggressively threw away the election and perhaps their future as a federal party. Incidentally, many citizens, realizing the necessity of a strong government during the difficult postwar years, voted for Mr. King as the only alternative that did not involve drastic experiments in socialism. The Communists made a curious further contribution to the election by running about thirty candidates of their own and urging the electors in all other ridings to vote Liberal. Their chief hostility was directed against the C.C.F.-Socialists (the "Social Democrats" of Canada), because of the latter's refusal to agree to a "united front" or to sanction other forms of Communist interpenetration. Only one Communist was elected.

In the Nova Scotia election, on October 22, the contesting parties were the Liberals (in power for the preceding 12 years) under Premier Angus Macdonald, the Conservatives under L. W. Fraser, and the C.C.F. under Donald MacDonald. The Liberals carried 28 seats, the C.C.F. were

reduced from 3 to 2, and the Conservatives, formerly the official opposition, were eliminated entirely.

In contrast to this decisive Liberal victory in a three-party fight, the Liberals in Manitoba and in British Columbia felt it necessary to maintain a coalition slate of candidates as against the C.C.F.-Socialists. The result in Manitoba on October 12 was: Coalition 43, Opposition C.C.F. 9, Independent C.C.F. 1, Ukrainian Communist 1, Independent 1. That in British Columbia on October 25 was equally decisive: Coalition 37, C.C.F. 10, Labor 1. In Manitoba, the C.C.F. seats had risen from 3 to 9, while in British Columbia they had dropped from 16 to 10. In all three of these recent elections, however, they became the official opposition. In this there is perhaps the pattern of things to come: a trend towards the merging of the two older, free-enterprise political parties as against the political challenge of socialism. The model of the C.C.F. is the Labour Party in Great Britain, and the success or failure of the Socialist experiment there will have great significance for the future of Canadian politics.

Of possibly even greater importance than the elections of 1945 was a conference of the nine provincial premiers with the federal prime minister, with a view to readjusting the administrative and economic relationships between the provinces and the federal government. When the Dominion of Canada was set up on a federal basis in 1867, the respective functions, jurisdictions and taxing powers, as between provinces and the central government, were carefully prescribed in the British North America Act, which is the basis of Canadian constitutional law. After seventy years, the stresses and strains of the system had become acute, as the economic and social development of the country had followed a course that was unpredictable in 1867 and had left the old division of powers and functions gravely obsolete. An Order in Council (P.C. 1908) dated August 14, 1937, therefore set up a Royal Commission to study the matter. This commission tendered its report in May 1940; but a Dominion-Provincial Conference held in 1941, in order to study and if possible to implement its recommendations, was frustrated by the obstructionist tactics of Premier Hepburn of Ontario and Premier Aberhart of Alberta. In August 1945, another attempt was made to face up to an intolerable situation. On this occasion, the atmosphere of the meeting was much more reasonable and cordial. The federal government had prepared a very extensive brief of what it was willing to offer to the provinces; and after some preliminary discussion, the provincial delegations went home to digest this brief before a later meeting. The economic gist of the federal proposal is that the provinces shall give up the collection of personal and corporation income tax and succession duties, and shall receive in exchange a per capita subsidy from the federal treasury. The proposed subsidies are in most cases much beyond what the provinces themselves have been able to raise from these same sources of income; but some of the provincial premiers are fearful lest they should be signing away the essential authority of their legislatures. As Colonel Drew, the premier of Ontario, has put it: "Any arrangement which provided for a centralized collection of the greater part of the tax requirements of provincial governments and made them mere annuitants of the central government, would place the control with the central

government to such an extent that meetings of the members of the legislature would become almost meaningless."

This may be an over-statement of the case. It was obvious that the Founding Fathers intended that over-ruling authority should rest with the federal government, for they reversed the American practice and wrote into the constitution that the residue of unspecified powers should inhere in the federal government and not in the provinces. The next seventy years, however, saw a continual breaking down of this principle, largely through a series of tendentious decisions by the Judicial Committee of the Privy Council in London, and in the twenties and thirties it became obvious that there had been such an unanticipated aggrandizement of provincial authority that there was danger of the whole federal system collapsing. During the war, however, the real seat of power was in Ottawa, and the astonishing measure of Canada's war achievement was in large measure due to the effectiveness of the centralized control. The problem now facing the country is that of reconciling the need of similar effective direction in the hazardous postwar world with the preservation of an essential minimum of provincial and municipal autonomy. See *REHABILITATION—Rehabilitation in Canada*.

CANADA'S NATIONAL PARKS. The first national park was established at Banff, in what is now the Province of Alberta, in 1885, especially to enclose the medicinal hot springs which are found in that area. The system was enlarged by the establishment of other national parks from time to time, until it now extends from British Columbia to Nova Scotia, consists of 26 units, and has an aggregate area of more than 29,000 square miles. Investment of the Canadian people in their national parks approaches \$44,000,000, aside from the value of the land and from the investments which have been made by corporations and individuals. Before the war the number of tourists visiting the national parks of Canada in a single year exceeded 1,000,000. With wartime restrictions on travel, and the other conditions inseparable from the great conflict, attendance fell to less than half that figure, and consisted mainly of Canadians and members of the armed forces from other British countries and the United States, temporarily in Canada. Since the conclusion of the war, a marked upward movement in attendance has been noted, and it is expected that this trend will continue and increase, as the world returns to normal conditions.

During wartime it was not the policy of the Canadian government to divert money and labor from the direct war effort by making capital investments in the parks, but due regard was had for maintaining them in proper condition and for the prevention of depreciation. Forest fires are the greatest menace to the parks, and during the war these were carefully controlled, so that losses were not abnormal. All parks have remained open during the usual park season, some of them operating only for the summer months and some the year round.

Although no new works of an extensive nature have yet been undertaken, much consideration has been given to postwar development of the national parks.

While it is impossible to state exactly what improvements will be undertaken in the near fu-

ture, the following are presented as the chief lines of thought being followed by those administering the parks in their study of postwar improvements: (1) Better arterial and secondary highways leading to national parks; (2) improved highways within the parks; (3) cheaper accommodation available to those of low incomes; (4) modern sanitary facilities and other conveniences; (5) secondary roads, foot and horse trails, in order to make points of special interest readily accessible; (6) improved fire and game protection to meet increased dangers from heavier and more widespread use of national parks.

Besides serving as recreation areas, the parks are used as national sanctuaries for wild animals and birds. The preservation of the North American bison has been closely associated with the national parks, as have also other forms of wildlife indigenous to the country. In the national parks all wildlife is rigidly protected, and primal natural conditions are maintained as far as possible.

The national parks of Canada are administered by the National Parks Bureau of the Lands, Parks, and Forests Branch, Department of Mines and Resources, with headquarters at Ottawa. This bureau also has supervision of the historic sites which have been acquired throughout the country on the recommendation of the National Historic Sites and Monuments Board, an honorary body of recognized historians organized to advise the government in this connection.

ROBERT J. C. STEAD,
National Parks Bureau, Ottawa, Canada.

CANADA'S WAR EFFORT IN 1945. The year 1945 saw Canada taking a full share in the military operations that brought the European war to an end in May. The country was actively regrouping its forces for a larger share in the Pacific war against Japan when the latter enemy suddenly collapsed in late August.

Military Operations.—The main Canadian share in the military operations of 1945 consisted of a grueling three months' campaign by the Canadian First Army, beginning in early February in the German Rhineland, slashing north through the five eastern provinces of Holland, and then wheeling east into northwest Germany, turning the enemy's right flank and capturing Oldenburg on the eve of the armistice.

The first seven weeks, beginning February 7, consisted of desperate fighting against some of Hitler's best troops, who were concentrated in the northern Rhineland in great force to guard the right flank of the Reich. During the first six days, the Canadians, starting from a point northwest of Düsseldorf, cleared the whole of the Reichswald. On February 15, they occupied Kessel and Viller, and also made progress toward Emmerich, taking Warbeyen and reaching the Rhine at one point opposite Emmerich. The next day they captured Huisberden and repulsed strong counterattacks. By February 17, the tenth day of their offensive, they had taken 7,000 prisoners, including 900 parachutists, and, northwest of Goch, had occupied Asperden, Hervorst and Hessem.

On February 27, the Canadian First Army launched an attack in great force, captured Calcar and Udem, and entered the Hochwald, where the opposition was very strong. On March 1 the troops, capturing Weeze, pushed through the Hochwald and linked up with the American Ninth Army. There was very hard fighting near Xanten and west of Wesel for several days.

Around the Wesel bend of the Rhine, the Germans had massed the largest number of guns and mortars ever faced by the Canadians in a single sector; and the fighting south of Xanten, particularly at Veen, was the bitterest in which they had ever been engaged. On March 9 the Germans broke, blew up the two bridges at Wesel, and retreated eastward. The result of just over a month's fighting was the capture of 50,000 prisoners and the inflicting of very heavy casualties on some of the enemy's best troops.

The next phase of the action lay to the north, where the Germans had concentrated their strongest units around Arnheim and in eastern Holland. On March 28, the Canadian First Army reached Emmerich, and two days later they crossed the Dutch frontier into Gelderland. The plan of attack was a slicing drive along the line of the IJssel River, due north, outflanking the German position from Arnheim to the Zuider Zee. By April 2 they had pushed 15 miles into Holland along the Zutphen-Hengelo road, and by April 4 they had entered the southern outskirts of Zutphen, previously best known in history as the place wherein Sir Philip Sidney received his mortal wound in battle in 1586. The opposition was very strong, and Allied parachutists were dropped to give the Canadians extra support; but it was not until March 8 that Zutphen was finally cleared. The tactical log jam had now been broken, and within two days Canadian patrols sped 40 miles north to reach the Zuider Zee, west of Meppel. By the 14th the Canadians were nearly 100 miles beyond Zutphen, occupying Leeuwarden, Apeldoorn, Groningen, and other towns in the northerly provinces of Friesland and Groningen. Some of the troops wheeled west and captured the North Sea port of Harlingen, near the end of the Zuider Zee causeway. By the 18th practically all of northern Holland had been cleared of Germans, many of whom fled by sea.

The last phase of the action was a swift eastward thrust into Germany, just south of Emden, turning the now vulnerable right flank of Germany's western defenses. Papenburg and Aschendorf were entered on the 21st of April, the peninsula south of Emden was cleared by the 27th, and on May 3, after severe fighting, the Canadians captured the city of Oldenburg. The next day, Field Marshal Montgomery announced that all German forces in Holland, northwest Germany, and Denmark were surrendering unconditionally as from 8 A.M. on May 5.

Its share in the defeat of Germany having been duly accomplished, the Canadian First Army was dissolved as a field formation on July 31. Some of its personnel were to be used for occupational duties in Germany, some were to be diverted to the campaign against the Japanese, and the rest were slated for repatriation and demobilization. Those remaining in the field were temporarily designated as "Canadian Forces in the Netherlands." Gen. H. D. G. Crerar, commander of the Canadian First Army, returned to Canada; and the command of the force in the Netherlands was taken over by Lieut. Gen. G. G. Simonds.

Pacific Operations.—For duty in the Pacific the forces planned in July 1945 were to consist of 30,000 infantry troops fighting under American command, a naval force of 37,000 (13,500 to man naval units and the balance as replacements), and an unspecified proportion of the 100,000 members of the Royal Canadian Air Force who were still to be maintained for duty.

The Pacific force, whose numbers were arranged by the Allied High Command, were so small in proportion to Canada's armed forces in the European theater of the war that service was now placed on a voluntary basis. Units of the Canadian Navy had begun to share in action off Japan when the sudden collapse of Nippon, hastened by the use of the atomic bomb, rendered any further Pacific program superfluous. Incidentally, it is worth noting that scores of Canadian scientists, working in the research laboratories of the University of Toronto, McMaster University, and the National Research Council, played a significant part in the larger pattern of controlled research—British, Canadian and American—that led to the effective invention of the atomic bomb.

Recapitulation, Armed Forces.—The end of the war provides an opportunity for recapitulating not merely the war effort of 1945 but that of the entire war, which, for Canada, lasted six full years.

At the outbreak of the war, one of the first tasks confronting this nation of fewer than 12,000,000 people was an overall assessment and redirection of its manpower to produce maximum strength for its armed forces and for its industrial and primary production needs. More than a million of its physically best entered the services, yet the depleted population produced more food, lumber and minerals, and manufactured a larger quantity of goods, than had ever before been turned out.

When Canada entered the war, its armed forces totaled only slightly more than 10,000—a naval nucleus of 1,700, a permanent army of 4,500, and an air force of 4,000. By the end of March 1945, the intake into the Royal Canadian Navy totaled 99,037, that into the Army 687,074, and that into the Royal Canadian Air Force 221,922, or a total for all services of 1,008,033.

The navy now consisted of 939 ships, of which 373 were combat ships. These had sunk, or helped to sink, at least 68 enemy surface vessels, had damaged 41 others, and captured two; and had also sunk 23 submarines. The Royal Canadian Navy had itself lost 24 warships, with casualties of 2,300.

As for the army, its continuous activity in Europe began on July 10, 1943, with the invasion of Sicily, where the Canadian 1st Division and 1st Armored Brigade were an important part of the striking force. This was likewise the case in Italy, where the 1st Canadian Corps was organized later in the year and fought for upwards of 20 months under Canadian command as part of the British Eighth Army. In June 1944, the Canadian 3d Division took part in the invasion of Normandy, and in August 1944 the Canadian First Army was in action in France. The heaviest Canadian actions of the year were (1) at Caen and Carpiquet, (2) the drive past Falaise and up the channel coast, and (3) the bitter fighting around the Scheldt estuary. During the spring campaign of 1945, from the Rhineland through east Holland to Oldenburg, all the Canadian army units in Italy were transferred to northwest Europe and incorporated in the Canadian First Army. Total army casualties at the close of hostilities were 21,806 dead, 51,428 wounded, 351 missing, and 6,469 captured.

The work of the Royal Canadian Air Force, consisted partly of developing and administering the British Commonwealth Air Training Plan, by which, under the clear skies of Canada, great

numbers of airmen, not only from the United Kingdom, Australia, New Zealand and Canada, but also from Belgium, Czechoslovakia, France, Mexico, Holland, Newfoundland, Poland, the West Indies and the United States, received their training in every branch of aviation. It also consisted partly of active service in every quarter of the world. There were RCAF units on Atlantic patrol from Canadian bases, on coastal command from English bases, on day and night fighter duty over and from England, and on bomber command attacking Europe. Even this gives only a fragmentary record of Canadian air achievement, because for every Canadian air crew serving in a RCAF squadron, there were several flying with RAF units in every command and in every theater of war. They had a hand in the smashing of the Mohne and Eder dams, and in the sinking of the *Tirpitz*. Canadian pilots fought in the long Battle of Malta; they accompanied a RAF mission to Russia; Canadians flew over the Western Desert and accompanied the Allied forces in the invasion of North Africa; they participated in air battles and bombing expeditions over the jungles of Burma. By the hundreds they were in transport command, ferrying aircraft across the Atlantic, over Africa, along the Persian Gulf, and wherever RAF craft were to be found. The casualties of the RCAF totaled 14,247 dead, 1,327 wounded, 2,505 missing, and 2,485 captured.

War Production.—Canada's role in war production was even more spectacular than that in the combat services. By 1945, Canada ranked not only as the second largest exporting nation in the world but also as the fourth largest producer of war supplies among the United Nations. Supply and capital commitments to the end of May 1945 totaled over \$10,900,000,000 or more than \$900 per capita. Some of the items manufactured were 14,696 aircraft, 707,000 military vehicles, 45,710 armored vehicles, 82,000 heavy guns, 1,475,800 small arms, 1,763,500 tons of chemicals and explosives, 89,200,000 rounds of heavy ammunition, and 7,918 vessels.

Fully 70 per cent of this very great output was supplied by Canada to Great Britain and Russia, and much of it as a free gift. Canada, which alone among the United Nations received nothing from American lend-lease, itself made extensive free contributions of war supplies, food and raw materials to other countries. During the two fiscal years preceding March 31, 1945, total Canadian expenditures under this "mutual aid" arrangement, for supplies freely shipped to the United Kingdom, the Soviet Union, China, France, Australia, New Zealand, and India, were estimated at \$1,727,603,000.

War Expenditures.—Total war expenditures in the six fiscal years preceding March 31, 1945, amounted to more than \$15,138,000,000, or about nine times the cost of war and demobilization in the First World War. The total tax revenues in the six-year period were \$9,393,000,000, while other revenues brought the total to \$10,576,000,000, about seven times the revenue collected during the First World War and its subsequent demobilization period. A notable feature of the wartime tax structure has been the increased reliance on direct taxation, especially in the form of the tax on individual incomes. As the cost of the war considerably exceeded the revenues available from taxation, recourse was also had to borrowing, especially from the general public. The total amount contributed by the latter in two "war loans" (January and September 1940)

and nine "victory loans" (June 1941, February and October 1942, April and October 1943, April and October 1944, April and October 1945) was in excess of twelve billion dollars. Neither was this taken up largely by a few big corporations, for the number of individual applications for the 8th Victory Loan alone was 3,178,275.

Economic Controls.—A final word should be said with regard to economic controls. Canada, in October 1941, was the first democratic country to adopt an overall price ceiling, with the result that the cost of living increased by only 2.8 per cent from that time until April 1, 1945. By this means, and by rationing and the drawing off of purchasing power through income taxes, compulsory saving and war loans, the disastrous inflation of the First World War was almost entirely averted.

CANADIAN CORPS ASSOCIATION. This association was formed in April 1935 as a result of the 1934 reunion of the veterans of the Canadian Corps, made up of those who had served overseas during the First World War. The association membership consists mainly of unit organizations which operated as such during the First World War. The association is supported by unit fees, which vary, as each unit is in large degree autonomous; and by the operation of a monthly magazine devoted to veteran's affairs, *Torch*, which is for sale to the public. In addition to the *Torch*, it also publishes *Signal*, a house organ circulated among units. The total membership is estimated at between 50,000 and 60,000. During 1945 the association devoted its energies to veteran's affairs, with special emphasis on housing. The annual meeting was held at Ottawa, Canada, Nov. 22-24, 1945. Officers of the association for 1945 were: president, Major G. Fay Davies; honorary treasurer, Major Edwin Meredith; honorary secretary, Col. J. A. McCamus. Organization headquarters: 71 King Street West, Toronto, Ontario.

CANADIAN LITERATURE. The primary purpose of the novel is to entertain. If it can at the same time instruct, so much the better. Two outstanding Canadian novels of 1945 fill both requirements. They deal entertainingly with the question of social and political relations of English-speaking and French-speaking Canadians, a question that has given serious concern to thoughtful Canadians, and is not without interest to Americans and others who face, in greater or less degree, the same problems. These two novels are: *Two Solitudes* by Hugh MacLennan and *All This Difference* by Dorothy Dumbrille. The scene of the former is Montreal and rural Quebec, and of the latter Glengarry County, the easternmost corner of Ontario, between the St. Lawrence and Ottawa rivers. Glengarry, once filled with Highland Scots, is today largely French-Canadian. Here, as in Montreal, racial and religious differences lead sometimes to tense situations. *Two Solitudes* is in a sense a companion novel to Gwethalyn Graham's *Earth and High Heaven*, mentioned in last year's survey, whose subject was the clash between Jew and Gentile in Montreal.

Very few books of fiction have been published with the people and atmosphere of Ottawa as their theme. Robert Fontaine, in *The Happy Time*, his first full-length novel, goes back to his boyhood home in the Canadian capital. The story has a slim plot, but there is in it more than

a little of the humor of character and incident that have made *Life With Father* so deservedly popular. When he pictures the French-Canadian father and uncles and grandfather, unconventional and engaging, against the human background of a Scottish mother, one feels that Fontaine is telling us something about his own people, and doing it very well.

Duncan Campbell Scott, the octogenarian Canadian poet, published many years ago a delightful collection of tales of French Canada, *In the Village of Viger*, that has this year been reprinted. John Macdonald, in *Darkly the River Flows*, tells the grim story of a bitter family feud between two brothers, the scene partly in Toronto and partly in the Temagami country far to the north. Fishing and hunting tales in Nova Scotia is the theme of Phil H. Moore's *The Castle Buck. Better Harvest*, by Violet King, reconstructs the stormy days before and during the Rebellion of 1837 in Upper Canada—the rebellion that was led by the grandfather of the present prime minister of Canada. Thomas H. Raddall, who has published several novels the scenes of which are laid in Nova Scotia, has brought together a collection of short stories, under the title *Tambour*, with about them the same tang of the sea. Nova Scotia and Glengarry seem to claim a large share of this year's Canadian fiction. *The Shadow of Tradition*, by C. Holmes MacGillivray, follows the fortunes of a pioneer family in Glengarry; and Will R. Bird's *Here Stays Good Yorkshire*, is not, as one might suppose, a tale of that English county made famous by Eric Knight, but has to do with the early days of Cumberland County, the borderland between Nova Scotia and New Brunswick. This and Philip Child's *Day of Wrath*, with a contemporary European background, share this year's Ryerson Fiction Award. Mabel Dunham, who, a decade or two ago, published an excellent story of the long trek of Pennsylvania Dutch to Upper Canada in the days of the Conestoga wagon, takes up the lives of some of their descendants in *Grand River*. While this survey does not attempt to cover the outstanding books of the year by French-Canadians in their own language, one should be mentioned. Mme. Germaine Guevrement's *Le Survenant* is an authentic novel of the life of the *habitant*—the small farmer—in the Richelieu Valley.

In the period between the two world wars, Archibald MacMechan, of Dalhousie University, prepared several volumes of prose sketches of sea exploits off the Nova Scotia coasts, in the great days of the sailing ship. Now another Halifax man, Andrew Merkel, in *Tallahassee*, tells more of the same salty sea yarns, in the easily flowing meter of the ballad. Edwin J. Pratt, whose *Collected Poems* were published last year, has issued this year a single poem, *They Are Returning*, into which he has put in vigorous verse his tribute to the men who are coming back to their homeland from the war:

They shall come back to build in stubborn rhyme
Out of Laurentian rock and Norman lime,
Memorial towers Canadian. . . .

And into Tom Melville's *Barbed Wire Ballads*, the simple, moving ballads of a Canadian soldier in a German prisoner-of-war camp, have been put unforgettable memories of battle. Anne Marriott in *Sandstone* reveals the essential sincerity of her verse, and its variety of form and subject. Helen Middleton's *Drumbeats Through Your Dreams* and Helen Fairbairn's *From Dawn to Dusk* contain notable additions to contemporary Canadian

poetry. Sir Thomas White has put his thoughts about certain events of the war into *The Battle of Britain*. Ira Dilworth has compiled an interesting and provocative anthology in his *Twentieth Century Verse*.

Stephen Leacock suffered from the same handicap as Mark Twain: people had been so accustomed to thinking that everything he said must have a humorous angle, that in the end they refused to take him seriously when he happened to be in an altogether serious mood. In *While There Is Time*—the last thing he completed for publication before his death—the former professor of economics at McGill University warns his countrymen of the danger of catastrophe that lies in the dispute as to private enterprise and state control, unless, before it is too late, these two principles are reconciled. Viscountess Byng, widow of a former governor general of Canada, has put her entertaining reminiscences into *Up the Stream of Time*.

Two Canadian historians, George W. Brown and Edgar McInnis, have recently had something worth while to say in print—the former in *Canadian Democracy in Action* and the latter in *North America and the Modern World*. The former amplifies here what Professor Brown had said in his *Building the Canadian Nation* about the Canadian system of government, and the latter turns from the theme of Canadian-American relations of Dr. McInnis's former book, *The Unguarded Frontier*, to the broader subject of nationalism and democracy on this continent. For the impartial student, a companion volume to Mr. Mackenzie King's speeches, mentioned in the 1944 survey, is *Left Turn, Canada*, by M. J. Coldwell, leader of the Cooperative Commonwealth Federation (CCF) party in Canadian politics.

Three recent contributions to the literature of Canadian art are D. G. W. McRae's *The Arts and Crafts in Canada*; a sympathetic but just study by William Colgate of the work of the landscape painter and scholar Charles W. Jefferys; and the second volume of Mr. Jeffreys' *Picture Gallery of Canadian History*. A fine tribute to a Canadian artist and writer, whose death early in 1945 was a severe loss to her country, is contained in *Emily Carr: Her Paintings and Sketches*, with a biography by Ira Dilworth and text by Lawren Harris. The National Gallery has also sponsored an important work on *The Development of Painting in Canada*.

The war is over, but books about it or its results continue to appear. Two that offer restrained but moving impressions of the life of Canadian airmen are *Only the Stars Know* by Flight Lieutenant D. A. MacMillen, and *The Diary of a Canadian Fighter Pilot*, by Flying Officer W. S. Large. The story of the Canadian Army overseas is told effectively by Ross Munro in *Gauntlet to Overlord*. A difficult phase of after-the-war problems is dealt with effectively in Vladimir Grossman's *The Pan-Germanic Web: Remaking Europe*, and M. H. Myerson's *Germany's War Crimes and Punishment*. Edgar McInnis published his invaluable survey *The War: Fifth Year*, completing the work.

LAWRENCE J. BURPEE,
Secretary, International Joint Commission, Ottawa.

CANADIAN MEDICAL ASSOCIATION. This association, which is affiliated with the British Medical Association, was founded in 1867, and held its 76th annual meeting at Montreal June 11-15, 1945. The membership of the association ex-

ceeds 9,000, which is more than 80 per cent of the total medical profession of Canada. Membership in the Dominion association is contingent upon membership in one of the nine divisional, i. e. provincial, medical associations. The association, which is particularly interested in medical education, and all things affecting the public health, such as nutrition, sanitation, medical care, and hospitalization, publishes *The Canadian Medical Association Journal*. The officers in 1945 were: president, Dr. Leon Gerin-Lajoie, Montreal; president-elect, Dr. Wallace Wilson, Vancouver; chairman of the council, Dr. A. E. Archer, Lamont, Alberta; honorary treasurer, Dr. D. S. Lewis, Montreal; managing editor, Dr. Frank S. Patch, Montreal; editor, Dr. H. E. MacDermot, Montreal; general secretary, Dr. T. C. Routley, Toronto; associate secretary, Dr. G. Harvey Agnew, Toronto.

CANADIAN NAVY. See NAVAL PROGRESS.

CANAL ZONE. See PANAMA CANAL ZONE.

CANALS. *The St. Lawrence Seaway.*—The long disputed and twice rejected St. Lawrence Seaway project came into consideration again by the United States Senate, when President Truman on October 3 sent a special message to Congress urging the speedy authorization of this project. While the message emphasized the power phase of the project, this would be of benefit to New York and New England in this country, which would be within the reach of the transmission lines from the power stations at the International Rapids. The seaway itself would serve for cheap means of transportation in the whole Great Lakes region, and make ocean-going vessels available to the Great Lakes ports. The proposal is now to turn over to the New York State Power Authority this country's share of the power facilities to be developed, the State of New York to assume the cost of these power facilities amounting to approximately \$93,000,000. The whole project would cost \$429,000,000, and Canada's part would be \$144,000,000. On the seaway, Canada has already reconstructed the Welland Canal around Niagara Falls and enlarged the locks to take ocean steamers of 25-foot draught. The locks and canals in the lower St. Lawrence remain to be enlarged, and the new canals around the proposed dams are to be built to give a minimum depth of channel all the way for boats of 25-foot draught. The new measure introduced into Congress to give effect to the United States-Canada agreement was a joint resolution and required only a simple majority of each house to effect its passage.

New Jersey Ship Canal.—This canal from Bordentown on the Delaware River above Philadelphia to the New York Harbor area, is still on the program as a part of the Intra-coastal Waterway. A small scale model of this canal has been made at Vicksburg to solve several problems, including the danger of salt water flowing into the canal from the harbor entrances. To avoid this three locks are placed at each end of the canal to maintain the canal and pool level at 10 feet above the mean low tidewater level. The canal will be 250 feet wide and 33 feet deep to give ample clearance for 27-foot draft vessels. The water supply will be pumped from the Delaware River, and will come also from the natural flow of the Raritan River.

San Diego Aqueduct.—In July the contract for the first 20-mile section of the San Diego, Calif., Aqueduct was let. It is the \$17,000,000 emergency project over a 70-mile route on which sur-

veys were made in the winter of 1944-45. The inlet end will be at the west end of the Colorado River Aqueduct's San Jacinto Tunnel. The terminal will be at the San Vicente Reservoir, 18 miles east of San Diego. The flow will be by gravity, and the construction will involve tunnel work which was scheduled to start on November 1.

Friant-Bakersfield Canal.—In August 1945, the Bureau of Reclamation announced that the first contract had been let on a section of the Friant-Bakersfield Canal in southern California. The building of this canal was held back on account of the war, but it is a major part of the great California Valley project which includes using surplus water from the Sacramento River to irrigate the northern part of the San Joaquin Valley, and by means of the Friant Dam to divert water from the upper San Joaquin south 160 miles to near Bakersfield. It will take about three years to complete this canal which will have a maximum depth of 15 feet and be 100 feet wide at surface level of the water. It will irrigate 1,500,000 acres and cost more than \$23,500,000, which was the 1940 estimate.

Proposed Tennessee River-Tombigbee River Canal.—In May 1945, a board of United States Army engineers opened a hearing in Mobile, Alabama, to bring up to date information on the proposed canal to link the Tennessee River in northern Alabama to the head waters of the Tombigbee River. The proposed plan includes a 20-mile canal across the low watershed between the Tennessee River near the Pickwick Dam and the Tombigbee. This latter river will be dredged and canalized through its course to Mobile Harbor to give the 9-foot barge stage. This was a proposed postwar project, and its chief value was that it affords a short cut from the Tennessee Valley to the Gulf of Mexico instead of by the Ohio and Mississippi rivers to New Orleans, and it would connect the Tennessee Valley directly with the Alabama River system. This is a \$66,000,000 project.

Miscellaneous.—In the lower Mississippi Valley and Gulf Coast region much valuable use has been made of the coastal canals and inland waterways by barge traffic. In the third quarter of 1944 more than 60,000 tank-car days were saved by barge shipment of petroleum alone by coastal canal from Texas to Florida. This and other shipments by water have started a program for the extension of waterway improvements. New Orleans has filed two petitions for construction of tidewater canals to connect New Orleans with the Gulf; and Dallas, Texas, has proposed to canalize the Trinity River to connect that city with Galveston Bay and the coastal barge canal.

E. C. McDOWELL,

Consulting Engineer, New York.

CANARY ISLANDS. A cluster of 13 islands in the Atlantic Ocean about 60 miles from Rio de Oro on the northwest coast of Africa, comprising two Spanish provinces, with an area of 2,807 square miles and a population of 687,937. The seven largest islands are Palma, Hierro, Gomera, Tenerife (which comprise the province of Santa Cruz de Tenerife), Grand Canary, Fuerteventura and Lanzarote (which, with the smaller islands, comprise the province of Las Palmas). The remaining six islands are little more than bare rock formations. Claimed by Spain in the latter part of the 15th century, the group is rugged and mountainous and contains evidences of volcanic activity. The soil where suited for agriculture provides grain, fruit, and vegetable crops in abundance. Coffee growing is the leading in-

dustry. Tenerife and Palma are noted for their excellent wine. Exports consist largely of bananas (50,834 metric tons in 1944), tomatoes, onions, potatoes, cochineal, sugar, fish, and wine. Leading imports are textiles, manufactured goods, cereals, and coal (110,026 metric tons of coal were landed at Las Palmas in 1944, mostly from continental Spain). Santa Cruz (pop. 72,358) and Las Palmas (pop. 119,599) are the principal ports. A 2-year government housing project was begun at Las Palmas in December 1944 to provide 442 apartments to shelter 2,314 tenants. Private construction has been hampered by the high cost of materials. Wireless and steamship connections are maintained with Spain (q.v.).

CANCER, Causation of. Interesting studies on the causation of cancer by a variety of chemical substances and in a large number of species of animals are being actively carried on in research laboratories. Many curious and so far inexplicable differences have been shown, for example: tar is an effective producer of cancer in man and rabbits when applied to the skin; it does not work with white rats, but produces a large number of skin cancers in mice. In guinea pigs tumors are extremely difficult to produce with this agent. Are these differences species differences, or are they due to local differences in tissues? We are not yet clear about this matter. Apparently the synthetic phenanthrene compounds and some of slightly differing structure, such as methylcholanthrene, are powerful inducers of cancer in almost all animals on which they have been tried. Tumors require a long time for their production in dogs and cats, and none have so far been induced in anthropoid apes. The time of appearance of these artificial tumors apparently is correlated with the average length of life of the animal. Tumors can be produced in mice in 3 or 4 weeks; in rats a longer time is required; in guinea pigs, in 6 or 8 months, and so on. In human beings tar and oil cancers require 10 or 15 years' exposure before they appear. Some years ago a Japanese group of workers showed that the feeding of rats with some azo compounds which have no relationship to the highly carcinogenic phenanthrene group will produce cancer of the liver in white rats. Immediately after publication attempts were made to confirm this in this country, but tumors were not produced. A re-study of the situation showed that the animals used by the Japanese were fed on a diet which was very poor in vitamins and that the production of cancer was correlated not only with the chemical, but with an avitaminosis, chiefly of riboflavin. A careful review of some phases of this situation has been carried out by Eugene L. Opie (*Journal of Experimental Medicine* 80: 219-246, 1944). The chemical which he used was what is known commercially as butter yellow, and chemically as para dimethyl aminoazobenzene. The work revealed that the situation is much more complicated than was at first thought, because it was originally believed that the chemical produced a cirrhosis of the liver first and that the cancer developed on the basis of the cirrhosis. This is what occurs very often in human beings. But the butter yellow produced liver tumors in the rat in the absence of cirrhosis though when the diet was modified so that cirrhosis was produced by an avitaminosis then the frequency of the tumors was greatly increased and in proportion to the severity of the cirrhosis. It was also noted that the presence of fat in the diet accelerates the production of

liver tumors with this chemical and that when the quantity of fat is very small, few tumors are produced. Apparently also some substance in the rice favors the production of cirrhosis and hepatic tumors in rats. The popular idea of cirrhosis of the liver in human beings has been that it is the result of inordinate and long-continued consumption of alcohol. The administration of alcohol does not often cause cirrhosis in animals. Also cirrhosis has been induced in man following acute tropical jaundice. There are those who do not believe that human cirrhosis is caused by alcohol, but it has been noted that during the First World War, when alcohol ceased to be accessible in Germany, that cirrhosis went with it. Such studies amply show the complicated situation which lies behind the appearance of tumors in animals and also in man. It is well known that alpha naphthylamine will produce cancer of the bladder in man and dogs. Why this locality is chosen by the chemical agent for its activity is scarcely possible to say, any more than it has been possible to solve the problem of why in Java the Chinese die of cancer of the stomach, and the Malays die of cancer of the liver. The Malays have a large amount of cirrhosis, but Mohammedans are supposed to abstain from alcohol. However, the writer has been informed by physicians who practised in Java that this abstinence is often somewhat imaginary. The facts however remain. All of this links up with the questions which were discussed in the *Americana Annual* in 1941, where it was mentioned that the administration of lipid substances extracted from normal human and animal tissues when injected into mice gave rise to cancer. There is no reason to think that human cancer is due to the lipoids; as in the human body they are widely distributed and are a necessary part of our food.

Human statistics have shown that malignant tumors are extremely rare in children, and that those which do appear are often of a complex type, which suggests that the growth has arisen from remnants of tissue misplaced during embryonic development. Cancer of the ordinary type which appears in adults is rarely seen. To test this point Smith and Rous (Smith, William E., and Rous, Peyton, *Journal of Experimental Medicine*, 81: 621, 1945) carried on a series of elaborate experiments in which fetal skin contaminated with a carcinogenic substance, methylcholanthrene, was embedded in the muscle tissue of adult mice. In these buried particles of epidermis cancer developed, and it was also possible in further experiments to obtain malignant tumors in fragments of embryo stomach and other organs. This explains the rarity of neoplasms occurring at birth or shortly afterward, which is due to the considerable length of time required for a tumor to develop under any circumstances, and not to any lack of capacity of the cells of the embryo itself to undergo malignant change.

Atomic Therapy.—The atomic bomb has greatly excited not only the public but also the newspaper writers and physicists and in many of the articles which have been published on the bomb it is broadly hinted that this discovery will very probably be of greatest value in the treatment of cancer. This attitude is apparently based upon the idea that the more destructive the dose of radiation of any type may be, the better it is in the treatment of cancer, while as a matter of fact, this is not true. The cyclotron beam was also supposed to be valuable and it was expected that patients would be exposed to the direct beams

of neutrons produced by this machine. Also the high-voltage generators, accelerating high speed electrons instead of deuterons, have been received with acclaim by the physicists as offering valuable material for cancer therapy. But a beam of electrons is just what is not wanted in such treatment, as they are highly destructive, as was found by the early workers with radium, and every precaution is now taken in practical treatment to screen off the particle rays, both alpha and beta, and use only the light, or gamma, rays. The after-effects of the atomic bomb are instructive as the delayed deaths of the Japanese who were not near the point of explosion obviously were due to gamma ray injury to the blood-forming organs. The very short-wave length of these gamma rays and possibly some of the accompanying neutrons make them very efficient in such destructive action, and the fact that some people died very rapidly and that some lived for a number of weeks is exactly what is observed when a group of rats is given an overdose of X-ray. In the early days the attempt was made to measure X-ray by the killing effect on small animals, but the spread in the deaths was so great that no definite lethal point could be found. The reason for this is that some animals die from one type of X-ray injury, which may be rapid, and others die at irregular intervals from anemia and destruction of the white blood corpuscles of the body, etc., and these deaths may not occur even in small short-lived animals for several weeks or more. An excellent letter from the conservative side is that of Dr. J. H. Lawrence (*Journal of the American Medical Association* 129: 91, 1945), who has had extensive experience with the use of various types of radiation both in animals and human beings, and with various types of radioactive substances produced by the great cyclotron at Berkeley, Calif. He points out that the physiological application of small quantities of these radioactive elements has been very instructive in tracing about the body the various elements which compose the human structure. It has been extremely interesting to know that the calcium phosphate of the bones, instead of being fixed, as one assumes, is really undergoing active breakdown, resorption and replacement; that the thyroid gland fixes iodine, but that the healthy gland takes up more iodine than a carcinoma of the thyroid, which takes up almost none; hence the healthy gland was destroyed and the cancer untouched when large doses were given. Radio strontium has been used on bone tumors as strontium replaces the calcium of the bone, but no cure was obtained. In leukemia the use of radio phosphorus has proved extremely difficult to control, and there have been a number of deaths due to the active destruction of the white cells, the danger of which was pointed out by W. Falta in a monograph published in 1918 (*The Treatment of Disease with Radioactive Substances*). The radioactive substance which he used was thorium X, and he advised abandonment of such treatment. Lawrence also calls attention to the bone tumors which have developed in man and animals after swallowing radium. The chief difficulty is that once the solution of a radioactive substance is injected, there is no way of neutralizing it, or removing it rapidly from the body, should acute poisoning result.

FRANCIS CARTER WOOD,
Emeritus Professor of Cancer Research, Columbia University; Director, Department of Pathology, St. Luke's Hospital, New York.

CANDIA. See CRETE.

CANNON, Walter Bradford, American physiologist: b. Prairie du Chien, Wis., Oct. 19, 1871; d. Franklin, N.H., Oct. 1, 1945. George Higginson professor of psychology at the Harvard Medical School from 1906 until his retirement in 1942. Dr. Cannon was noted for his work in the fields of endocrinology and neurology. Dr. Cannon was graduated from Harvard University in 1896, received his M.A. degree in 1897, and his M.D. degree three years later, when he became an instructor in physiology at that university. As a lieutenant colonel in the United States Army Medical Corps in the First World War, he was principally responsible for solving the problem of traumatic shock, the reaction or disturbance in the human system after a person has been wounded or injured. It was established by Dr. Cannon and his American, British, and French associates that the damaged or dead tissues became toxic, causing an increased permeability of the smallest blood vessels resulting in the loss through their walls of qualities of the blood that should be in circulation. Returning to Harvard at the end of the war, he continued his research work and in 1931 announced his discovery of a hitherto unknown adrenalin-like hormone which he called sympathin. Dr. Cannon was the author of *Bodily Changes in Pain, Hunger, Fear, and Rage* (1915), a standard reference work on the subject.

CAPE VERDE ISLANDS. See PORTUGUESE COLONIAL EMPIRE.

CARBON BLACK. Increasing demand for synthetic rubber compounding, particularly in the late months of 1944, lifted sales and production of carbon black to new peaks, according to the United States Bureau of Mines. Production for the year gained 35 per cent over 1943 to 801,860,000 pounds, or 207,795,000 pounds above the old high in 1941. Total sales expanded 49 per cent over 1943 to 937,430,000 pounds and were 135,570,000 pounds more than production. Producers stocks were therefore depleted to 69,243,000 pounds at the end of 1944, the lowest level since 1928, and continued to shrink in the first quarter of 1945. The output by contact processes increased 9 per cent in 1944, following a three year decline, but was 17 per cent below the record of 1940. Furnace black production continued to grow rapidly, increasing 81 per cent over 1943 to 387,184,000 pounds and equaling 48 per cent of the total production of carbon black in 1944, compared with 36 per cent in 1943. Record sales to rubber companies of 738,029,000 pounds accounted for 79 per cent of the 1944 total.

CARIBBEAN COMMISSION, Anglo-American. See ANGLO-AMERICAN CARIBBEAN COMMISSION.

CARNEGIE CORPORATION OF NEW YORK. A trust established by the late Andrew Carnegie in 1911 for "the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies." Its endowment consists of two funds totaling some \$135,000,000, one of which, \$10,000,000, is applicable in the British Dominions and Colonies. The income only is subject to the disposal of the trustees. On Sept. 30, 1945, the total assets of the corporation were \$170,379,323. Of this the sum of \$135,336,868 repre-

sented the endowment and legacy which compose the permanent and major income-producing funds given by Mr. Carnegie to the corporation. The additional assets cover unpaid obligations other than those charged to future income and also provide a margin of protection against depreciation in the market value of securities. The income for the fiscal year 1944-45 was \$3,989,705 in the Main Endowment Fund, applicable in the United States, and \$356,618 in the fund applicable in the British Dominions and Colonies. The income in the larger fund was equivalent to 2.59 per cent on the investment in securities and the income in the smaller fund, to 2.60 per cent. Appropriations for the 1944-45 fiscal year were: Carnegie agencies, \$175,000; colleges and universities, \$85,000; general agencies, \$729,500; various agencies, \$13,000; total, \$1,002,500, of which \$990,000 was from the Main Endowment Fund and \$12,500 from the British Dominions and Colonies Fund. In the four-year period ended Sept. 30, 1945, the corporation devoted \$2,771,867 to undertakings directly connected with the national emergency. Devereux C. Josephs was elected president to succeed Walter A. Jessup, who died in 1944; he assumed office on June 1, 1945. Other officers of administration are: Robert M. Lester, secretary; C. Herbert Lee, treasurer; E. A. Farintosh, comptroller. The corporation's offices are at 522 Fifth Avenue, New York 18, N.Y.

DURAND R. MILLER,
Record Clerk, Carnegie Corporation.

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." Its major activities in 1945 were carried on through the following divisions and departments: Astronomy: Mount Wilson Observatory (Pasadena, Calif.); Terrestrial Sciences: Geophysical Laboratory and Department of Terrestrial Magnetism (Washington, D.C.); Biological Sciences: Division of Plant Biology (Stanford University, Calif.), Department of Embryology (Baltimore, Md.), Department of Genetics (Cold Spring Harbor, Long Island, N.Y.), and Nutrition Laboratory (Boston, Mass.); Historical Research: Studies in aboriginal and pre-Columbian American history, and in the history of science with headquarters in Cambridge, Mass.

The institution is an operating organization for fundamental research, primarily in fields of the physical and biological sciences. It seeks to concentrate its attention on specific problems, with shift of emphasis from time to time to meet more pressing needs of research as they develop with increase of knowledge. Under normal conditions means are also available occasionally whereby individuals or small groups of investigators may undertake and carry to completion special studies which have relation to established research activities of departments and divisions.

Income on investments for the year 1945 amounted approximately to \$1,300,000, which was required for support and maintenance of major projects undertaken by the institution, and for aid in war projects. Results of work were made known through technical and scientific journals, the *Year Book*, and a series of scientific monographs. The last *Year Book* of the institution appeared in January 1946, and contained accounts of research activities of the institution for the year ended June 30, 1945. To date, the institution has issued over 800 monographic publications. The

customary programs of institution exhibits and lectures were again omitted in 1945.

Dr. Vannevar Bush is president of the institution. The office of administration is located at Sixteenth and P Sts., Washington 5, D.C.

CAROLINE ISLANDS. See JAPANESE SOUTH SEA ISLANDS.

CARPATHO-UKRAINE. See RUTHENIA.

CASSEL (Karl), Gustav, Swedish economist and author: b. Stockholm, Sweden, Oct. 20, 1866; d. there, Jan. 14, 1945. One of the world's outstanding authorities on monetary and international economic matters, Professor Cassel was concerned with translating the effect of monetary and economic changes into terms of social purport. He was graduated from Uppsala University in 1895 and received various honorary degrees. He became professor of political economy and financial science at Stockholm University in 1904. In 1920, his *Memorandum on the World's Monetary Problems* won him international recognition, and the next year he submitted a paper on the same subject to the League of Nations. He served on the Swedish delegation to the International Economic Conference held at Genoa in 1922, and that same year was engaged by Soviet Russia as adviser to the then newly created Russian State Bank. He represented Sweden at the International Chamber of Commerce meetings in London, 1921; Rome, 1923; Brussels, 1925; Stockholm, 1927; and Amsterdam, 1929. At the invitation of the banking committee of the House of Representatives, he came to the United States in 1928 to give his opinions on the stabilization of the dollar. During this visit, he lectured at Columbia and other leading colleges and universities.

Appointed to the Royal Swedish Academy of Science in 1914, Professor Cassel received the Gold Medal of the academy in 1922, and became its president in 1926. In 1933, he became professor emeritus at Stockholm University, and was appointed expert on tax matters and financial questions for the Department of Finance of the Swedish government.

He was author of *Money and Foreign Exchange After 1914* (1922); *Fundamental Thoughts in Economics* (1925); *Post-war Monetary Stabilization* (1928); *The Crisis in the World's Monetary System* (1932); *On Quantitative Thinking in Economics* (1935); *The Downfall of the Gold Standard* (1936); *Autobiography*, 2 vols., in Swedish (1940-41).

CASSIRER, Ernst, German philosopher: b. Breslau, Germany, 1874; d. New York City, April 13, 1945. Noted for his contributions to the philosophy of culture, the theory of language, the history of transcendental philosophy, and the theory of scientific knowledge, Dr. Cassirer was one of the leading philosophers of the contemporary period. After attending the Breslau Gymnasium, Dr. Cassirer studied at the Universities of Berlin, Leipzig, Heidelberg, Munich, and Marburg, receiving a Ph.D. degree from the latter institution in 1899. He taught philosophy at the University of Berlin from 1905 to 1919, when he was appointed professor of philosophy at the University of Hamburg, where he also served for some time as rector. He was ousted from this post in 1933 under the Aryan and political-conformity sections of the Hitler Civil Service Act, left Germany, and lectured for two years at All Saints College, Oxford University. In 1936 he became professor of philosophy at the University

of Gothenburg in Sweden. Upon his arrival in the United States in 1941, he was made visiting professor of philosophy at Yale University, where he remained until 1944, when he was appointed a visiting professor of philosophy at Columbia University.

Dr. Cassirer held an honorary doctor of laws degree from the University of Glasgow, and an honorary Ph.D. degree from the University of Gothenburg. He was the author of more than 100 books and articles in German and English. Among his works are *Das Erkenntnisproblem in der Philosophie und Wissenschaft der Neuren Zeit*, 3 vols. (1905; 1906; 1920); *Philosophie der Symbolischen Formen*, 3 vols. (1923-29); *Determinismus und Indeterminismus in der Modernen Physik* (1937); and *An Essay on Man* (1944).

CASUALTY INSURANCE. See INSURANCE.

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC WELFARE CONFERENCE, National. Established in 1919, the National Catholic Welfare Conference is an organization of the members of the Catholic Hierarchy of the United States for the purposes specified in the Brief "Communes" issued by Pope Benedict XV, April 10, 1919, and in the Letter of Pope Pius XI, of August 10, 1927. It is not a council or legislative assembly, as contemplated by the Sacred Canons of the church and therefore, the resolutions of the bishops at the meetings of the National Catholic Welfare Conference do not have the force of law. Every bishop may make use of any service offered by the conference through its departments, committees, general secretary, and staff officers at the national headquarters, 1312 Massachusetts Avenue, Washington 5, D.C.

The conference is incorporated under the laws of the District of Columbia and has for its objects the unifying, co-ordinating and organizing of the Catholic people of the United States in works of education, social welfare, immigrant aid, civic education and other activities. The conference is administered by a board composed of ten bishops elected at the annual meeting of the Hierarchy of the United States to serve for the term of one year.

Active co-ordinating officials, serving the Administrative Board, are the general secretary, Very Rev. Msgr. Howard J. Carroll, S.T.D., the assistant general secretary, Rev. Paul F. Tanner, and the assistant to the general secretary, Rev. Philip J. Kenney.

HENRY P. LEFEBURE,
Business Manager, NCWC.

CAUCASUS, kô'ka-sûs. General name for the extreme southeast portion of the European section of the Union of Soviet Socialist Republics, a region which lies between the Black and Caspian seas and borders Iran and Asiatic Turkey on the south. This isthmus, connecting Europe and Asia, is divided by the main Caucasian mountain range, which extends east to west, into the North Caucasus, which is part of the Russian Soviet Federated Socialist Republic (q.v.), and the Transcaucasus. After the downfall of the Russian Empire in 1917, three independent republics were set up in the Transcaucasus—Azerbaïdzhān, Armenia, and Georgia, all three federating later with the USSR as the Transcaucasian Soviet Federated Socialist Republic. Under the Soviet Constitution of 1936, the Transcaucasian Republic

was again separated into the former three independent republics.

The Caucasus was the scene of heavy fighting between Soviet and Axis forces during the late fall of 1942. The Germans, attempting to gain control of Soviet oilfields, drove into the Caucasus as far as Nalchik, about 40 miles northwest of the Grozny oilfields, before they were halted and driven out by the Red Army.

CAVIGLIA, Enrico, Italian Army officer: b. Finale Marina, near Savona, Italy, May 4, 1862; d. there, March 22, 1945. During the First World War, it was Marshal Caviglia's brilliant strategy in the notable campaign of Vittorio Veneto which defeated the Austrians in 1918, and led to the armistice in that theater. Educated at the Turin Military Academy, Marshal Caviglia took part in the Eritrean War in 1888-90 and in 1896-98; served as Italian observer in the Russo-Japanese War; and as commander during the Tripolitan War in 1911-12. In July 1917 he was given command of the 24th Corps which broke through the Austrian lines on Bainsizza plateau; and in June 1918, he was chosen to command the Eighth Army which participated in the final victory of Vittorio Veneto. From January to June 1919 he served as minister of war, and in November of that year was promoted army general. During 1920 he commanded Italian forces which closed a blockade about the late Gabrielle D'Annunzio's legionnaires in Fiume, bombarded the city, and forced D'Annunzio to capitulate after he attempted to seize Fiume in contravention of the First World War Treaty of Rapallo. Caviglia was made field marshal in 1926. He eschewed Fascist politics, and in 1943 Marshal Pietro Badoglio is said to have sought his aid in formulating a plan to oust Mussolini.

CAYMAN ISLANDS. See JAMAICA.
CELEBES. See NETHERLANDS INDIES.

CEMENT. The decline in production and demand for cements, which began in 1943, continued through 1944, according to the United States Bureau of Mines. Total production of 92,152,399 barrels of hydraulic cements was 32 per cent below the 1943 figure. This reduction results from respective decreases of 32 per cent in the output of portland cement and of a grouping of all other hydraulic cements (natural, masonry, puzzolan, and hydraulic lime). In the portland cement industry the rate of operations was 38 per cent, and in the others 36 per cent of productive capacity in 1944. Mill shipments were 26 per cent below 1943 volume and totaled 95,592,155 barrels. Demand for portland cement and the group of all other hydraulic cements, as gauged by shipments, declined nearly one fourth from 1943. Stocks of all hydraulic cements at mills on Dec. 31, 1944, were 19,976,371 barrels, or 15 per cent below the quantity on hand at the close of 1943. The average net mill realization per barrel of portland cement increased 2 cents over 1943 to \$1.59 in 1944, but that for all other hydraulic cements dropped 4 cents to \$1.24 in 1944.

CENTRAL AMERICA. See COSTA RICA; GUATEMALA; HONDURAS; HONDURAS, BRITISH; NICARAGUA; PANAMA; PANAMA CANAL ZONE; SALVADOR (EL SALVADOR).

CEYLON. A British island colony in the Indian Ocean south of India. With outlying islands, the area is 25,332 square miles, and the population was estimated in 1943 at 6,197,000. The capital

and principal seaport is Colombo (pop. 345,000); other towns include Jaffna (47,708), Galle (38,500), and Kandy (37,147).

The *Maldivé Islands*, a dependency of Ceylon, comprise a group of 13 coral atolls 400 miles southwest of the colony (pop. 93,000). It is administered from Malé, the capital, by a sultan ("Lord of the Thousand Isles") with the aid of a People's Assembly, most members of which are elected. Dried fish, cowrie shells, coconut coir, and tortoise shell are the principal exports. In July 1945 it was disclosed that three months before the attack on Pearl Harbor in 1941 a force of British marines was landed secretly on Addu Atoll, southernmost of the group, to construct a port and airbase; subsequently the convoy route to Australia was protected from here, and operations were carried out against the Japanese Navy.

People.—While some 70 races are found in Ceylon, Singhalese constitute more than half the inhabitants and Tamils one quarter, most of the latter having migrated from India for work on the plantations; the others, besides whites, include Burghers (a mixed strain of natives, Dutch, and Portuguese), Moors, and Malays. Most of the Singhalese are Buddhists, and the Tamils are Hindus; there are lesser numbers of Moslems and Christians. Education is free in vernacular schools conducted by the government (in 1943, 2,172 schools with 242,999 pupils) or in receipt of state aid (1,916, with 242,806 pupils); fees are charged in English and bi-lingual schools (394, with 76,360 pupils). There are 142 vocational schools; and in Colombo, a Royal College, Teachers Training College, and Technical College. The Ceylon Medical College and Ceylon University College were consolidated in 1942 as the University of Ceylon (996 students in 1944-45).

Government.—A governor (Sir Henry Moore appointed Dec. 4, 1944) administers the colony with the aid of 3 officers of state (ex officio) and a State Council having both legislative and executive functions. The State Council has 61 members (the 3 officers of state, 8 nominated officials, and 50 elected by universal adult suffrage on a territorial basis); 7 elected members are chairmen of 7 executive committees and ministers for the subjects concerned, and with the 3 officers of state they constitute a board of ministers which prepares the annual estimates of revenue and expenditure. Because of diverse racial interests the political situation is complex and unsatisfactory to most. In May 1943 the British government undertook to meet the demand for complete self-government, and in 1944 dispatched a Royal Commission under Lord Soulbury to examine proposals on the spot. Meanwhile, before that body had made its report, the State Council drafted a proposed constitution of the dominion type for Ceylon. The estimated revenue for 1944-45 was put at Rs.266,432,000, and expenditure was expected to amount to Rs.251,883,055.

Production.—The crops of greatest economic importance are tea (549,571 acres) and rubber (637,739 acres); despite wartime difficulties and poor weather conditions, production in 1944 was close to normal prewar level (tea, 112,000 tons in 1940; rubber, 150,000 tons in 1943). Coconuts occupy the largest cultivated area (1,238,000 acres), and other acreages under crops include rice (850,000), native foodstuffs (140,000), and arecanuts (69,000); among other crops are palmyra, cacao, citronella, cinnamon, tobacco, cotton and cardamoms. Cultivation of food crops on plantations became compulsory on Jan. 1,

1943. The government began development in 1944 of a commercial plantation of cinchona at an estimated cost of Rs.1,500,000, and undertook a study of sericulture, silkworm eggs being imported from Mysore, India.

Graphite, ilmenite, vanadium, and monazite are mined, and quarries of small gems yield sapphires, rubies, moonstones, cat's-eyes, and other semi-precious stones. Numerous new industries were started during the war, including steel-rolling, cement making, and the manufacture of cigarettes and cheroots; fiber of wild hanna (aloe) is used for spinning twine and weaving mats. Native industries are pottery, metal and lacquer work, basket making, and gold, silver, brass, ivory, and tortoise-shell work.

The economic and financial conditions in 1944 were highly satisfactory. Both imports and exports attained record figures, the former reaching Rs.500,000,000 and the latter Rs.617,000,000; re-exports were valued at an additional Rs.60,000,000, also a record. Exports to the United States far exceeded imports therefrom. Imports consisted principally of cotton piece goods, foodstuffs, coal and coke, liquors, sugar, fertilizers, and petroleum products. Since 1941 the unit of currency has been the Ceylon rupee, worth \$0.301202 in 1944.

Communications.—In 1944 there were 960 miles of railroad open for traffic (843 miles of 5 foot 6 inch gauge, and 117 miles of 2 foot 6 inch); highways exceeded 19,000 miles, of which 5,633 miles were fit for automobile traffic throughout the year. It was disclosed in 1945 that since May 1943 aircraft have regularly covered the route from Ceylon to Western Australia (from July of that year operated by the Qantas Airline of Australia), the longest nonstop flight in the world; passengers are presented with a "certificate of the double sunrise," for the sun rises twice during 19 hours of the flight.

CHACO, El, ɛl chă'kô. A region of South America which includes parts of Argentina, Bolivia, and Paraguay. It may be divided into El Gran (grän) Chaco, a territory claimed largely by Paraguay and Bolivia, and El Chaco, a territory lying within Argentina.

It is a low-lying alluvial plain with an area of approximately 100,000 square miles, claimed principally by Paraguay and Bolivia. It is bounded on the east by the rivers Paraná and Paraguay and on the south and west by the Argentine provinces and the Republic of Bolivia. After the Chaco War over the boundary between Bolivia and Paraguay (1932-35), a treaty of peace was signed at Buenos Aires on July 21, 1938. It was agreed by both countries that their boundary in the Chaco area should be fixed by the presidents of six American republics, including the United States. On Oct. 10, 1938, the six plenipotentiary delegates awarded approximately 69,000 square miles of the territory to Paraguay, the remainder to Bolivia. Diplomatic relations have been restored between the two countries. Paraguayan population in the Chaco is estimated at 45,860, of whom about 8,000 are native Indians.

CHAD. See FRENCH EQUATORIAL AFRICA.

CHAMBER OF COMMERCE OF THE UNITED STATES. In a year almost equally divided between war and peace, the activities of the Chamber of Commerce of the United States were of a dual nature. Until the surrender of Japan in mid-August, first priority in its activities was given

to facilitating in every possible way what was then the most important job of American industry—the full and unstinted supply of everything needed by the armed services. As the organization representing American business men as a whole in Washington, the national chamber found innumerable ways of expediting this essential activity.

In its thinking the national chamber recognized that reconversion, to be successful, must involve nothing less than a major reconstruction and expansion of the country's industrial economy. A mere restoration of the prewar pattern of production and consumption would obviously be inadequate to provide useful employment for a labor force grown to unprecedented size, supplemented by millions of returning war veterans. The new aim must be a volume of production and consumption from 30 to 50 per cent greater than ever before known in time of peace.

In the latter part of the year, the efforts of the national chamber were directed at the early and complete removal of restrictions on production, sales, raw materials, financing, and all other branches of business activity which had necessarily been imposed during the war emergency, and also at the promotion of better understanding and co-operation among the various elements of the population.

BEN H. LAMBE,
Manager, Publicity Department, Chamber of Commerce of the United States.

CHANNEL ISLANDS. A group in the English Channel, 10 to 30 miles from the French Normandy coast, part of the British realm since 1066. The islands, which have an aggregate area of 75 square miles, comprise Jersey (28,717 acres), Guernsey (15,654 acres), Alderney (1,962 acres), Great Sark (1,035 acres), Herm (320 acres), Little Sark (239 acres), Brechou (74 acres), Jethou (44 acres), and Lihou (38 acres). At the last census (1931), the total population numbered 93,205, Jersey having 50,462 inhabitants; Guernsey, Herm, and Jethou, 40,643; Alderney, 1,521; and Sark, Brechou, and Lihou, 579. With the surrender of France in 1940 the islands were demilitarized and partly evacuated, and they remained in German occupation until the war ended in 1945. Jersey is administered by a lieutenant governor, who is assisted by a legislature termed the States Assembly, and a like system applies to Guernsey (of which the other islands are dependencies); a "bailiff" presides over both legislatures and also heads the judiciary, termed the Royal Court. While French is the official language, English is permissible in the legislatures. In 1939 the revenue of the Channel Islands amounted to £953,681, and the expenditure was £964,315; the public debt stood at £2,785,704. The principal exports are tomatoes, potatoes, fruit, flowers, and granite. The islands have celebrated breeds of cattle, principally Jerseys and Guernseys. The chief town of Jersey is Saint Héliér, on the south side, and Saint Peter Port is the principal town of Guernsey.

The German garrison of the Channel Islands, numbering some 27,500 men, was surrendered to British forces by Admiral Hoffmeyer on May 12, 1945, and a civil affairs unit was landed to help in the task of reconstruction. Hundreds of houses had been damaged or destroyed in Allied bombing raids, and the islanders were found lacking clothing, food, and all foodstuffs save vegetables. German marks were withdrawn and replaced by sterling currency, and food was rationed on a scale about 25 per cent higher than in Great

Britain. Some of the islands, notably Alderney, had been used for the imprisonment of Russian soldiers and the interment of Jews, about 1,000 of them having been murdered by starvation and beatings. Considerable criticism was voiced in Britain concerning the lengths to which some local officials had gone in co-operating with the Germans; in a statement issued on July 18, the (British) Ministry of Information commented that "during five years of occupation such as these people have undergone, when there was always one German for every three islanders, and sometimes many more, it is impossible to avoid some degree of apparent collaboration."

CHAPULTEPEC DECLARATION. See **INTER-AMERICAN AFFAIRS**; **PAN AMERICAN AFFAIRS**; **WORLD POLITICS**.

CHAUVEL, Sir Henry George, Australian Army officer: b. New South Wales, Australia, April 16, 1865; d. Melbourne, Australia, March 4, 1945. A hero of the Palestine campaign during the First World War, General Chauvel was chief of the Australian General Staff from 1923 to 1930, and in the Second World War served as inspector in chief of the Australian Home Guard.

After attending Sydney and Toowoomba grammar schools, General Chauvel began his military career in 1886 by joining the New South Wales Cavalry Regiment as a second lieutenant. He distinguished himself in the South African War, and in the First World War, during which he was cited in dispatches nine times; he commanded Australian cavalry in Egypt and Gallipoli, and headed the Desert Mounted Corps from 1917 to 1919 in the Palestine and Syrian campaigns, including the capture of Damascus.

CHEMICAL WEAPONS. See **CHEMISTRY**.

CHEMISTRY. With the ending of the Second World War the profession of chemistry can pause and take stock not only of its contributions to Allied victory but of advances that can be carried over into the days of peace. When the United States entered the war in December 1941 chemical process industries were well prepared to furnish the materials of war and to expand with increasing needs.

The first great challenge to the chemical profession was the replacement of imported natural rubber with several hundred thousand tons of synthetic products having essentially the same properties and usefulness. This challenge and others not so apparent at first were met promptly and successfully.

In the First World War there were constant sources of uneasiness about the supply of explosives, particularly sodium nitrate and toluene. In this war there was an unfailing and continuously growing and relatively much greater flow of explosives than could have been dreamed of in 1918. The enormous task of supplying two fronts on opposite sides of the world with all the varied material demanded in modern warfare and its storage and protection in the extremes of climate was one which challenged the ingenuity of scientists and engineers. Losses due to time, heat, cold, dryness, and moisture were negligible.

In addition to describing the advances and discoveries of the current year, this article will sum up briefly the progress that was made during the entire period of this nation's participation in the war, in order to give a picture of the chemical industries as they enter the period of reconversion.

In very general terms there is the paradox of

greatly reduced and restricted progress in the basic science of chemistry and unbelievable progress in production of almost every material that depends on chemical change. The goal of research in the war period was not advancement in fundamental knowledge, but rather better, faster, and more efficient production of known products by known methods. Where substitutes had to be provided, research under pressure developed these substitutes, but in general there have been relatively few new products or new methods of production.

The total value of manufactured products of the chemical process industries has increased from \$11.2 billion dollars in 1939 to an estimated \$32 billion dollars in 1944. Leaders in these industries are of the opinion that reconversion to peacetime products can be accomplished with relatively little difficulty. Many new products are planned. There is a considerable amount of accumulated demand which will be felt well into the close of 1946.

With the great increase in manufactured products dependent upon chemistry there has been a serious and disturbing falling off in the rate of production of the chemists and chemical engineers who are vital to these industries. Some members of these professions who entered the armed forces utilized their chemical training and experience, and others did not. Some of the latter made use of their general scientific sense and ability to think, but an unfortunately large number did routine work. Most of these men will return to chemical industry and losses due to their absence will be written off as the cost of war. The most serious loss and one which will be felt for several years to come has been in the interruption of the training of thousands of chemistry and chemical engineering students, many of whom are permanently lost to the profession. Comparatively few students in these fields remained in college in 1944. This break in the process of training scientists and engineers to take the place of older men is most severely felt in the graduate schools. Those who return to their studies at the end of the war will not begin to make up for those who will not be able to begin college training or will not be willing to undertake the seven year journey to a doctor's degree. Not until students in the sciences cease to be drafted and seven years thereafter can the regular process of training research workers be resumed at the former rate.

Chemical Weapons.—In the early days of the war there was considerable anxiety among city dwellers along the Atlantic seaboard regarding possibilities of bombing and gas attacks. Defense preparations were extensive and elaborate. Defense officers were trained and they in turn trained others until several million people were prepared to meet the hazards of incendiaries and toxic gases. This phase passed as Allied superiority in the air made it increasingly evident that Axis planes in force would never reach this continent.

Vast quantities of chemical warfare agents were produced and held in readiness, and masks, protective clothing, neutralizing chemicals and other defense measures were available to American troops. The use of toxic chemicals in this war was negligible, partly because of the certainty of immediate retaliation and partly because modern warfare did not lend itself to this type of attack.

However, the trench mortar, developed in the First World War to throw gas shell, was per-

fected and extensively used with both phosphorus and high-explosive shell. The Chemical Warfare Service was responsible for the development and use of effective screening smokes, large smoke machines laying down dense curtains miles in length. The chief contribution made by this branch of the army was the improved use of incendiary bombs and flame throwers. Fire bombs were commonly made of magnesium, which burns fiercely when sufficiently hot, and were filled with mixtures of thermit, barium nitrate, aluminum powder, and petroleum. Others consisted of jellied gasoline in a pipe equipped with a long strip of cotton gauze. The cloth tail served to slow down the rate of fall of the bomb so that it would not be shattered, but still permitted considerable penetration before a delay fuse set off the explosive charge, which in turn scattered the incendiary material. The range of flame throwers was greatly increased by the use of jellied gasoline and heavier petroleum distillates so that flaming lumps reached their targets with relatively little loss until they were at a point where intense heat was needed. This method of warfare proved tremendously effective against pill boxes and caves.

The products of chemistry that were used for the first time in this war included colored smokes for identification and signalling; colored cloth protected by resins for similar purposes and for camouflage; dyes released in water to attract rescue planes to flyers forced down at sea; and dyes and repellent chemicals to hide and protect men from the attack of sharks.

In the field of explosives, production was rapidly increasing to meet the needs of England and France long before the United States entered the war. Expansion of facilities and improvement of known processes in fixation of atmospheric nitrogen, production of toluene from petroleum distillates, and reduction in time and solvents permitted vast increases in the amount of military explosives that were supplied to meet the rapidly expanding program of invasion and bombing in Europe and the Pacific. More powerful and faster explosives were developed. The use of rockets required a new type of powder which could not be made by the old solvent process. Rocket powders must have a long burning time at uniform rate, must burn without smoke, and must function at low pressure and over a wide temperature range. These requirements were met by adding nitroglycerin to a slurry of cellulose nitrate in water, centrifuging the solids, drying, and shaping into strands, which were examined either by X-rays or by supersonic waves to detect flaws interfering with proper performance. The process of making small arms powder was made more simple and efficient by forming the powder into small globules instead of extruding it as perforated rods which were cut to proper lengths. The "ball-powder" process is said to be five times as fast as the older method. The detonation of ammonium nitrate was made easier by coating grains of this substance with nitrostarch, itself an explosive, and setting off the starch with a booster charge of T.N.T.

The Atomic Bomb.—The basic research on which this new, startling, and revolutionary weapon was developed was done largely by physicists and mathematicians. When the urgency of war made it necessary to design and operate plants for the production of uranium-235 and plutonium on a scale millions of times larger than that of the research laboratory, chem-

ical engineers formed the largest single group of technologists in the entire project. Much of the engineering was entirely unorthodox, which has long been characteristic of chemical engineering operations. Several of the larger chemical firms of the country were associated with manufacturers of mechanical and electrical engineering equipment in building and operating the enormous plants in Tennessee and Washington. Chemists and chemical engineers also were a considerable part of the research staff in New Mexico. The staggering sums spent in the development of the atomic bomb are of the same order of magnitude as those spent in attaining present levels in production of synthetic rubber and aviation gasoline. Like these two gigantic projects, the final success of the atomic bomb was the result of the co-operative efforts of scientists, engineers, and skilled workers from numerous fields.

Protection of War Supplies.—The great varieties of climate, including steaming jungles, salt-laden mists, desert dryness, and intense cold made the shipment and storage of munitions, food, clothing, weapons, and all manner of war supplies extremely difficult. The earlier procedure of coating guns, tanks, and machinery with oil was largely replaced by wrapping with impregnated paper and spraying on tough but readily removable plastics. Shortage of metal and the necessity for thicker and tougher containers were met by employing fiber. Paper bags and cardboard containers were made waterproof by impregnation with asphalt and synthetic resins. Iron and steel machinery suffered little corrosion because their moisture-resisting containers were supplemented and reinforced by efficient drying agents, such as silica gel impregnated with a chemical which changed color before a dangerous humidity could develop.

Instruments and Operating Techniques.—The tremendous increase in production without corresponding increase in operating personnel was due in part to the use of indicating, recording, and controlling instruments. For example, by employing radioactivity and electronics a small instrument carried and operated by one man can measure the thickness of vessel walls and detect points of failure and can also determine the height of liquid in a vessel without access to its interior. The principle involved is that intensity of back-scattered radiation is a measure of wall thickness. As the instrument is moved down the wall of a container of uniform thickness the reading of the microammeter is constant until the liquid level is reached, at which point there is a sudden and marked increase of the radiation.

Such processes as the distillation of fatty acids and of metal vapors, the separation of vitamins from natural products, and the drying of penicillin and blood plasma depend on operation at extremely low pressures such as were formerly obtained only in small equipment in physics laboratories. These extremely low pressures were attained by diffusion pumps, backed up by the more common types of mechanical pumps that remove and discharge the gases removed by the low-pressure pumps. Rapid and uniform heat results from high-frequency electrical oscillations, and this method of heating is finding very extensive use in a great variety of industries. Fruits and vegetables exposed to steam or boiling water even for a short time in the "blanching" process are likely to soften or to lose vitamin C. This can be avoided if these food materials are exposed to high-frequency electrical heat for a few seconds before they are frozen or dehydrated, and

the deactivation of enzymes that destroy vitamins and flavor is equally effective. Electrical heat of this type is particularly adapted to articles of considerable thickness that are being molded or cured under pressure. Initially applied in laminated resin technology, this procedure is being extended to the vulcanization of rubber with saving of time and attaining higher and more uniform quality.

Heavy Chemicals.—A characteristic of chemical process industries is that many of the chemicals which play important parts in them do not appear as finished products. With the great increase in demand for munitions as well as civilian goods, there has been a corresponding increase in the production of what are commonly known as heavy chemicals.

Sulfuric acid, one of the most useful and versatile of heavy chemicals, was produced in 1941 to the extent of 6.86 million tons (100 per cent basis). By 1944 production had increased to 9.09 million tons. In considering the sulfuric acid industry it should be remembered that this chemical may be used several times. It appears first in its most concentrated form and ultimately disappears in processes requiring a dilute and not too pure a material. The largest single use of sulfuric acid, even in the war years, has continued to be in the production of fertilizers. Plant foods in the fertilizer season of 1943-44 contained in terms of thousand tons: nitrogen, 380; phosphorus pentoxide, 758; and potassium oxide, 373, representing increases of 64 per cent, 80 per cent, 59 per cent over the average 1935 to 1939 figures. Increases in caustic soda are represented largely by the electrolytic process with the simultaneous production of chlorine. Total domestic capacity of all nitrogen fixation plants in the United States is of the order of 1.32 million tons, of which less than one half goes into fertilizers. A considerable part of the remainder is consumed in explosives, which are practically all nitrogen compounds. At least a part of this producing capacity may have to be retired with the ending of wartime demands.

Glass and Silicate Materials.—Improvements in the field of glass have been limited largely to specialties that have little resemblance to the usual form of glass products. Tanks made of specially tough glass sheets with joints sealed by glass-fiber tape impregnated with synthetic resins have entered the field formerly occupied by glass-lined equipment. Porthole and searchlight covers and reflectors are made of a case-hardened glass which is said to be practically bulletproof. Glass containing small amounts of didymium has proved very superior in the shields used by arc welders. Ultraviolet rays are filtered out by a special glass that prevents stratosphere fliers from suffering severe burns. Glasses made from phosphorus pentoxide and small amounts of metal oxides or from practically pure aluminum metaphosphate not only resist the action of hydrofluoric acid but also the effects of weather, and have a low coefficient of expansion. The addition of small amounts of ferrous and ferric oxide gives these glasses the power to absorb both infrared and ultraviolet rays.

Foam and fiber glass products represent the chief improvements in the modern glass industry. Foam glass is made by adding carbon to ground glass of a special composition and heating the mixture to a high temperature. The resulting product is made up of tiny interconnecting cells. Water is taken up in very small amounts and only on the outer surface of an article made of this material, as evidenced by a gain in weight

of not more than 2 per cent after 24 hours immersion in water. Foam glass has been used successfully in floats and in life rafts and is a most valuable insulating material.

Glass fibers are used alone and in connection with other materials. Extremely fine fibers with diameters of only a few one hundred thousandths of an inch form a down that has been used in sound-proofing blankets for heavy bombers and also as a heat insulating material. This product would appear to have a future in radio, television, and motion picture industries. Glass fibers of somewhat larger diameters, but still very fine, replace kapok in life jackets. Production of this material has recently reached a rate of one million pounds per month. Glass fibers in the form of a floss are being used as separators between the plates of storage batteries, thus releasing further amounts of hard rubber. Such batteries can be shipped fully charged but without acid in order to cut down hazards of handling. Metal baskets packed with coarse glass fibers and stacked in towers take the place of the more expensive bubble-cap columns in certain commercial distilling operations. Thin layers of glass fiber protect catalyst beds from clogging and contamination in oil-cracking operations. Glass fibers impregnated with synthetic resins are used as armor that gives better protection than steel, and by virtue of being distributed as plates in pockets of vests and other garments can be easily discarded. A somewhat similar material deadens sound and protects against cold in stratosphere planes. Asbestos and glass fibers are woven together into a coarse fabric that resists abrasion, corrosion, and heat. Glass cloth coated with rubber combines high tensile strength with resistance to many solvents, oils, and chemicals. Synthetic resins reinforced by glass fibers have exceptionally high strength and impact resistance.

Clay products that resist the breaking effect of sudden application of heat or cold because of high thermal conductivity add greatly to the use of chemical stoneware equipment in industries dependent on such material for high strength and impact resistance to the action of chemicals.

Metals.—The production of ingot steel reached 98.5 per cent of the capacity of United States plants in 1944, or a total of nearly 90 million tons. This required a very considerable increase in the coking of bituminous coal. Something like 18 per cent of all soft coal was carbonized for the production of steel-mill coke. By-product coke ovens now have a capacity of nearly 74 million tons, so that only a few million tons of coke need to be furnished by beehive ovens. With a shortage of certain coking coals and surplus of anthracite fines some plants found it possible to mix from 3 per cent to 5 per cent of the hard-coal fines with the soft coal usually fed exclusively to coke ovens. Due to variations in types of ovens and of coal supplies this practice has not been general. About 12 per cent of all steel is of the type known as "alloy steel." By proper treatment much of the so-called "emergency steel" has been made equivalent to the older steels. Within given ranges of carbon content the chemical composition of steel is of much less importance than the proper regulation of temperatures. The steel industry has profited by improved mechanical equipment and better methods of heating. In this industry high-frequency induction heating has begun to play a part. Small quantities of boron of the order of a few ten thousandths of 1 per cent have markedly increased hardening depth.

The other metals, grouped together under the general term "nonferrous metals" and representing a combined production of only a small fraction of that of iron, are nevertheless very important, particularly in meeting certain special war demands. Attention has been directed to a large extent to the light metals, aluminum and magnesium. The strenuous efforts to build up their production resulted in 1945 in accumulation of a considerable surplus of both metals and very drastic curtailments in many of the plants. The peak of peacetime production of aluminum was of the order of 164,000 tons, but stimulus of war needs in this country resulted in a designed yearly capacity of nearly 1,100,000 tons.

Earlier in the war there was considerable alarm over the possible cutting off of imports of high-grade aluminum ore from South America to supplement dwindling supplies in this country. A process was developed and operated to a considerable extent which utilized some of the accumulated "red muds," waste products in the process of producing pure alumina from bauxite. This material is as rich in alumina as low-grade ores, silica in both interfering with and preventing the recovery of alumina. By heating these wastes with lime and soda in kilns the silica is made to combine with the lime to form an insoluble calcium silicate, leaving the alumina as a soluble sodium aluminate. The solution of aluminate is treated in the same way as in the usual process for high-grade ore. Another process that added to the supply of practically pure aluminum depended on the digestion of scrap metal, composed either in part or entirely of aluminum alloys, with a solution of caustic soda. A solution of sodium aluminate is obtained which is practically free from other metals, both those mechanically mixed with aluminum and those alloyed with this metal. Alumina was recovered from this solution and combined with the usual cell feed for production of the pure metal.

Until comparatively recent years the annual production of magnesium was between 2,000 and 3,000 tons. By 1940 this figure had risen well above 30,000 tons. With the entrance of the United States into the war magnesium plants were built very rapidly up to a manufacturing capacity of 300,000 tons. Actual production in 1943 was 190,000 tons and in 1944 the annual rate was estimated to be 246,000 tons. Peacetime demands will probably be nearer the 1940 figure. Fully 80 per cent of all magnesium was produced by the electrolytic process, using fused magnesium chloride. Thermal processes included reduction of magnesium oxide by carbon and by ferrosilicon, the latter process operating at a very low pressure. Magnesium chloride was obtained from sea water and from magnesium oxide that was treated with chlorine and carbon.

The amount of lead ore being mined has decreased during the war period, probably because of manpower shortages. About half as much lead was imported in 1944 as that obtained from domestic ores, and there was also some importation of lead ores. Metal recovered from scrap amounts to about three fourths that produced from ore. Storage batteries account for fully one third of all lead metal. Other important uses include cable covering, paint pigments, and lead tetraethyl for preventing knock in internal-combustion engines. While lead has largely given way to steel in projectiles, an easily broken and relatively harmless bullet is now in use for target practice against planes. This bullet is made of lead powder with synthetic resin as a binder, the mixture being ex-

truded into cavity molds. Such projectiles withstand the shock of firing, but disintegrate on the target, their impacts being electronically recorded.

Nickel, chromium, tungsten, and cobalt, together with carbon and iron, make up a new type of hard-facing alloy for automotive valves. This alloy offers excellent resistance to the action of leaded fuels at high temperatures.

In the field of corrosion prevention it has been long known that zinc chromate has high protective powers for steel but is not directly applicable to metal surfaces. By plating the steel with zinc or cadmium and subsequently treating the plated surface with chromium compounds, a very thin layer of zinc or cadmium chromate is formed with only slight removal of the metal that is being coated. The protective coating is quite ductile and stands rough handling. Its natural color varies from olive drab to mouse gray, but by the use of dyes almost any desired color can be obtained. Metals coated with selenium are protected against corrosion by sea water.

During the war period additional supplies of metallic calcium were needed for the production of calcium hydride, a portable source of hydrogen for observation balloons. Since neither hydrogen nor helium are available in liquid form in cylinders, a compact solid that will produce hydrogen on contact with water has considerable military value. Calcium is ordinarily made by the electrolysis of fused calcium chloride, but a new process, utilizing the general techniques of the ferrosilicon process for magnesium, has proved successful. Calcium oxide and aluminum powder (a waste product in the purification of aluminum by volatilization) are mixed and formed into briquettes which are charged into nickel-chromium retorts. These are under very low pressure as they are heated. The pure calcium metal condenses to form a hollow cylinder in the condenser. An extremely thin layer of oxide or nitride is formed on the metal when the vacuum is broken. Other metals are separated by selective condensation.

Powder metallurgy involves molding articles out of metal dust under enormous pressures and heating until the individual grains fuse slightly and are bound together. A new method of preparing finely divided metals for this process depends on their deposition as fine crystals by the passage of an electric current through a bath of fused salts. These crystals require no further grinding and are free from the oxide coating that may characterize reduced metal powders. With proper handling, unwanted metals that are codeposited with the desired metal are removed by reaction with the fused salt bath.

Petroleum.—A very heavy burden has been borne by the petroleum industry during the war period. In addition to furnishing motor fuels and domestic and industrial furnace oils for civilian use, this industry was called upon for vast quantities of fuel oil for warships, transports, and cargo vessels, ordinary gasoline for tanks, trucks, landing craft and military cars, large amounts of Diesel fuel, exceptionally high-grade gasoline for aircraft, toluene for explosives, and butadiene for synthetic rubber. Alcohol from the fermentation of grain shared heavily in the burden of the rubber program.

In spite of ever increasing demands, exploration operations were restricted and crude oil has been drawn from fields at a higher rate than is consistent with the greater ultimate yields. Wells have been sunk to still deeper deposits, some of

them going down for as much as two and one half miles. Special alloys in drill bits have made drilling easier.

Transportation problems were complicated in the earlier part of the war by the presence of numerous Axis submarines along the Atlantic coast. As this menace was removed there came the added demand for supplying the Pacific fleet as well as land operations in that theater of war. The rapid completion of two pipe lines, the "Big Inch" consisting of 1,250 miles of 24 inch pipe with the necessary pumping stations and bringing 300,000 barrels of crude oil daily from the Texas fields, and the "Little Inch," a 20 inch line 1,500 miles long, carrying gasoline from the Gulf-coast refineries to the New York area, helped to solve this problem. In connection with exploration for oil, helium is being used as tracer gas to determine migration of oil and gas in reservoirs. The gas is injected in well bores and determined in gas from adjacent wells with observation of times and concentrations.

Wherever petroleum is handled there is constant danger of fire. The foam system is the chief means of protection. A new type of foam can now be produced by mixing 6 parts of a hydrolyzed protein from soybean meal, protected against bacterial action and oxidation by special chemicals, with 94 parts of water, with the addition of ten times the volume of air. Five gallons of the protein liquid will make 900 gallons of foam, which will stick to vertical as well as to horizontal surfaces.

The chief advances in the petroleum industry have been in the field of high-octane aviation fuels. Practically all the processes and procedures employed by the industry during the war period had been worked out and were either in pilot plant stage or successful operation at the beginning of the war. It remained only for the industry to engage in a vast construction program in order to be able to meet the greatly increased needs of war as well as to supply in restricted amounts the ordinary gasoline for civilian use.

The first major advance in the production of aviation fuel was the introduction of catalysts in the breaking up of heavier hydrocarbons into those more suitable for modern internal combustion engines. At the outset the catalyst, consisting of porous beads, was packed in towers and the heated hydrocarbons were passed through these towers. At intervals the accumulated carbon was burned off in a stream of air. Better contact and more effective conversion were attained when the catalyst was continually moved as it came in contact with the hot hydrocarbon vapors. One process involves dropping the solid catalyst from baffle to baffle in a tower against the rising gases and lifting the solids by bucket elevators to begin the operation anew. The same type of flow is employed as the catalyst is regenerated. Several of the largest catalytic plants in the United States employ a process in which the catalyst in the form of a dust is carried as a suspension in the hydrocarbon vapors. The mixture of dust and gas flows as a fluid and requires very little pumping, the heavier column of dust-laden gas being balanced against a rising column of dust-free gas. Reaction takes place in chambers, the turbulence in these maintaining very even temperatures. Pressures in this process are very low in comparison with the older thermal cracking processes. The catalyst is readily recovered in cyclone collectors backed up by electrostatic separators. Catalytic processes are said to be very versatile, producing at will aviation gasoline, aromatic hydro-

carbons for explosives, or olefins for the synthetic rubber industry. The fluid catalyst technique has already been extended to the production of phthalic anhydride from naphthalene, and is very likely to prove useful in chemical industry in general.

Saturated hydrocarbons are now being converted in vast quantities to unsaturated hydrocarbons by catalytic dehydrogenation. On the other hand it is often necessary to add a limited amount of hydrogen to certain reaction products before they are ready for use as aviation fuels. Even in the dehydrogenation operation considerable amounts of hydrogen must be present to control the reaction and to prevent its going too far. A considerable amount of the unsaturated hydrocarbons, mainly butadiene and ethylene, are raw materials for the synthetic rubber industry. Others are starting substances for making gasoline blending agents.

A reaction that has been of great value in the production of the branching chain hydrocarbons so essential in the prevention of knock in internal-combustion engines is known as alkylation. This involves the addition of such isoparaffins as isobutane and isopentane to unsaturated hydrocarbons, mainly butylenes, to form saturated hydrocarbons of the desired structure. Alkylation is accomplished by heat alone or more commonly by sulfuric acid or liquid hydrogen fluoride.

Unsaturated hydrocarbons with short branching chains are caused to polymerize to form longer branching chain hydrocarbons which are liquids. These are hydrogenated to become valuable blending agents for aviation gasoline. Typical among these are iso-octane and triptane. Often two different olefins combine together to form what are known as "dimers." These operations are also carried out either under the influence of heat alone or with the assistance of catalysts containing phosphoric acid, silica, and pyrophosphates.

In order to secure an ample supply of isoparaffins the abundant straight-chain butane and pentane are subjected to mild heating in the presence of hydrogen chloride and aluminum chloride contained in fused antimony chloride. This process is known as isomerization and has greatly increased the production of aviation fuels.

Aromatic hydrocarbons are made from straight-chain paraffins by first causing the formation of cyclic hydrocarbons known as naphthenes or cycloparaffins. These are then robbed of some of their hydrogen by controlled reactions in the presence of hydrogen and catalysts until they become aromatic hydrocarbons of the same type as those gotten from coal gas and coal tar. It is estimated that in order to supply the aromatic hydrocarbon, toluene, for the manufacture of T.N.T., if it could not have been made from petroleum distillates, it would have been necessary to have increased the present coke oven capacity of this country about 300 per cent. Obviously this would have been impossible when it is remembered that a ton of coal yields only about one half gallon of toluene. Other aromatic hydrocarbons such as cumene are excellent blending agents in aviation gasoline. Cumene is made by combining petroleum refinery gases with benzene from coal gases.

These chemical processes just described yield substances of known composition and structure, which are mixed with approximately equal amounts of straight run or cracked gasoline and a little lead tetraethyl to produce aviation gasolines that permit the high speeds necessary in modern warfare. These fuels are entirely un-

sued to present automobile engines, since much smaller quantities of the blending agents are sufficient to make the highest grade gasoline which these engines are capable of using. Future automobile power plants will probably demand increasing quantities of the materials used so abundantly in aviation gasoline, with consequent increase in power and smoothness of operation, so that the developments of the war period will continue to pay dividends in the years to come.

In the meantime motor fuels from petroleum may be increasingly supplemented by products derived from the action of hydrogen on carbon monoxide. Both of these starting substances are readily produced from coke and steam. Such processes were extensively used in Germany during the war period and one company in the United States announces the production of 75 octane gasoline (80 with lead tetraethyl) from the same materials, the source, however, being methane from natural gas.

A hazard of motoring and particularly of aviation is the highly inflammable gasoline in the fuel tanks. A safety gasoline has been developed which will not ignite at ordinary temperatures. Although boiling between 300°F. and 400°F., this fuel has the power of 100 octane gasoline. It consists of catalytically cracked gasoline from which the most volatile material has been removed, blended with a hydrogenated polymerized butylene and heavier alkylated products, to which sufficient lead tetraethyl has been added. This fuel can not be used in present equipment, but requires either a new type of carburetor or direct injection into the engine cylinder.

Diesel engine fuels are now considerably superior to those used before the war period. Extraction with solvents, hydrogenation, and addition of various substances have contributed to this improvement.

Excessive thickening of lubricating oils with cold and thinning with heat is now prevented by the addition of a liquid of the same general chemical nature as acrylic resins but representing a lesser degree of polymerization. This protection is especially necessary for oils used in hydraulic and recoil mechanisms, and will probably be of greatest value to stratosphere planes. Lubricants are often handicapped by a tendency to foam, particularly in locomotive cylinders and in internal combustion engines. This tendency has been increased by the presence of additives to prevent oxidation and sludge formation. Foaming can be greatly reduced by addition of small amounts of polymerized dihydrocarbon silicones, a new use for these interesting silicon derivatives.

Petroleum derivatives have been commonly used to protect machinery against water. A new type of protective liquid of undisclosed composition has been announced recently, the news having been held up since early in the war period because of its importance. This liquid has great penetrative and insulating ability and its viscosity is low. It is a powerful wetting agent and displaces water from metal surfaces. In order to demonstrate the remarkable properties of this liquid insulating agent, an oil-burner motor from a flooded basement was sprayed with this material. The motor ran smoothly and has continued to run for two years while immersed in soapy water.

Sulfuric acid has considerable use in treating petroleum products to bring about removal of undesirable substances. Some of the sulfonates formed during such operations are proving quite

useful in lining the molds in which rubber articles are formed. This material is mixed with water before it is applied by spraying, brushing, or dipping. Originally these sulfonates were very dark in color, which limited their use to black goods, but they have been improved so that they may be used with white or light-colored materials.

Paraffin wax, one of the minor products of the petroleum industry, has made a noteworthy contribution to the packaging of war supplies. Something like 80 per cent of the 70 million pounds of paraffin wax is being utilized in waterproofing paper products. Microcrystalline waxes derived from petroleum prevent the cracking and breaking of paraffin coatings. Chlorinated paraffins have reached a chlorine content of 70 per cent as compared with the previous upper limit of about 40 per cent. This material is a resinous solid, most of which is consumed in the treatment of cotton duck to make it more resistant to flame. Linoleum, cable coatings, and lacquers account for smaller amounts of these chlorinated paraffins, which are resistant to many chemicals and which do not cause skin irritation.

Petroleum products are raw materials in a number of chemical process industries. Nearly twice as much of these materials are employed as starting substances as the combined production of the coal distillation industry. Synthetic toluene in the manufacture of T.N.T. and butadiene in the rubber industry have already been referred to. Large quantities of alkyl halides, alcohols, glycols, ketones, acetic anhydride, and many other industrial chemicals have their origin in the petroleum industry. Total production of chemical raw materials from petroleum amounted in 1943 to 1.56 billion pounds.

Oils and Fats.—Since oils and fats are vegetable and animal products, the quantities which can be produced are not as capable of rapid increase as in those industries dependent on natural deposits. A world shortage of these products of agriculture has caused numerous complications in industries dependent on them. Approximately two thirds of these materials are consumed by the food industries. Lard and butter represent two thirds of edible fats and oils, the remaining food requirements being met largely by cottonseed and soybean oils. Reduction in the amount of cotton grown in the United States has caused a decrease in the production of cottonseed oil, and for the first time it is exceeded by soybean oil. The quantity of this food oil, however, has not yet approached the maximum production of cottonseed oil, which amounted to 1.8 billion pounds in 1926.

The chief chemical achievements in this field have to do with paint and varnish oils. The shortage of such oils as tung oil and linseed oil has been partially compensated by the dehydration of castor oil and by fractional separation of fatty acids by distillation and extraction. The unsaturated acids thus separated are esterified with pentaerythritol, which incidentally is a synthetic product made by a reaction between formaldehyde and acetaldehyde.

The soap industry, which accounts for about 20 per cent of the total consumption of fats and oils, has been somewhat handicapped by the shutting off of coconut oil imports. Most of the surface-active agents that function as detergents besides soap are derivatives of oils and fats, but some can be made from petroleum derivatives, and to a small extent have compensated for shortages of natural raw materials. Glycerin, a

by-product of the soap industry, has been in such demand in the explosives industry, that it is recovered by practically all soap manufacturers. A process for the synthesis of glycerin from petroleum refinery gases has been perfected, but so far has not been put into operation.

Alcohols.—While very considerable quantities of alcohols, particularly the secondary alcohols, are made from refinery gases and some higher alcohols and butylene glycol are fermentation products, chief interest during the war period has been centered on ethyl alcohol because of its use as a raw material in the synthetic rubber industry. In 1944 about 60 per cent of the butadiene consumed by this industry was made from alcohol, the remainder coming from petroleum refinery gases. Construction of equipment for making butadiene from the latter source was somewhat delayed, but its completion in 1945 will make it possible for the petroleum industry to produce a larger share of this important raw material. The chief process for making butadiene from alcohol involves the catalytic oxidation of alcohol to acetaldehyde, which reacts with additional alcohol in the presence of another catalyst with the loss of water to yield the desired hydrocarbon, C_4H_6 .

The larger part of industrial alcohol has been made from grain. Prior to the war blackstrap molasses was the major raw material in this industry, but the supply from the West Indies was cut off by the shortage in tankers. So great has been the need for industrial alcohol that the production of beverage alcohol from grain was discontinued for the duration of the war. Average prewar production of alcohol was of the order of 100 to 125 million gallons of 95 per cent material. Production in 1944 approximated 600 million gallons, and the figure for 1945 is estimated to be about the same amount. It is interesting to note that from 50 to 60 million gallons of ethyl alcohol are now being made each year from ethylene, which in turn is derived from petroleum refinery gases. While this is only a small fraction of the total alcohol supply, it represents double prewar production from this source. In order to maintain proper perspective it should be remembered that nearly half of the supply of ethyl alcohol is consumed in industries other than the synthetic rubber industry. An important war use that is of minor importance in peacetime is in the manufacture of military explosives of the propellant type. A great deal has been said about alcohol as a motor fuel. To all of this may be added the recent discovery that the injection of alcohol and water or steam into the gasoline-air mixture greatly improves the performance of internal-combustion engines. Considerable research needs to be done before this procedure can become standard, but there are indications that it may result not only in cleaner engines, but in less fuel consumption and the permissible lowering of 10 to 12 octane numbers. Polymerized acetaldehyde may replace alcohol in making solid fuel tablets. Since acetaldehyde is made from calcium carbide as well as from alcohol, this represents a possible competition in a small way for the fermentation industries.

Turpentine and Rosin.—The war period has seen some shifts in the naval stores industry. More turpentine and rosin are made from waste wood and less from living trees. The great increase of the sulfate process for making wood pulp has led to the use of pine chips and to a notable production of turpentine from this source. A new use of alpha pinene from turpentine is in

the manufacture of an insecticide, the pinene being isomerized to camphane, which in turn is made into a complex thiocyanate. Rosin is finding new uses in waterproofing dirt roads, in preventing winter damage to concrete, in furnishing acids for synthetic paint oils, as binder for casting sand cores and molds, and as an ingredient in oil-resisting paper board. It has been found that spraying sulfuric acid on the cut surfaces of pine trees will delay the coagulation of rosin and permit longer flow of exudate.

Cellulose Products.—Considerable savings of wood has been effected by the use of high-pressure jets of water to remove bark from logs. The trend in production of wood pulp is distinctly toward the sulfate process. Originally used for the manufacture of brown wrapping paper, it is now accounting for a large tonnage of white papers. Sulfate pulp can be made sufficiently pure to serve as a raw material for cellulose nitrate for smokeless powder, formerly made only from cotton linters or sulfite pulp. In the ordinary sulfite process there is relatively little recovery of lignin or chemicals. A successful pilot plant operation indicates that substitution of magnesium bisulfite for calcium bisulfite in the cooking acid will permit evaporation of the spent digester liquids without scale formation in the evaporators, so that the lignins may be burned as a source of heat and the chemicals may be recovered and recycled. Pellets of cellulose fiber from which little or no lignin has been removed are employed in ordinary sandblasting equipment to remove carbon from internal-combustion engines. This material is very durable, permitting repeated use, and the danger of scratching the metal is eliminated. A recent use of sulfite-pulp by-products is the addition of calcium lignosulfonate to concrete mixes to prevent the clumping together of cement particles. Concrete in which this dispersing agent has been used is said to be less porous, stronger, and more durable than ordinary concrete.

In the field of chemical derivatives the production of rayon continues to increase, an important war use being in tire cord. In 1944 production of rayon in the United States reached a peak of 724 million pounds, 169 million pounds being staple. The viscose process leads with 369 million pounds, while acetate rayon reached a production of 172 million pounds. Methyl cellulose has been found to function satisfactorily as an artificial humus in soil, and has other agricultural uses such as a dressing for tree wounds, a protective coating for seeds, fruits, cut flowers, and roots for transplanting, and a culture medium for bacteria.

Textiles.—Improvements in this field during the war years include the development of water-repellent finishes such as quaternary ammonium compounds of pyridine, the halogenation of wool, the crimping of rayon staple to resemble wool, the production of vinyl ester fibers of higher melting point, the prevention of shrinkage and wrinkling of woollen fabrics, the impregnation of fabrics with colloidal silica to avoid shine and to reduce runs in hosiery, the coloring of fabrics by incorporation of pigments rather than by the adsorption of dyes, the development of nylon fibers with improved properties, and better continuous methods of hydrogen peroxide bleaching. Somewhat related to this field is the treatment of wool on sheepskin with nitric acid in dilute alcohol, which results in straightening of the individual hairs so that there is a close resemblance to such furs as seal and beaver. The color of the

wool after treatment is yellow, but it may be dyed almost any dark color.

The return of nylon to peacetime uses should result in making available more than 20 million pounds for hosiery. Tires have been absorbing around 10 million pounds per year and the remainder has gone into tow ropes, parachutes, and GI shoe laces.

Synthetic Rubber.—Within five years American chemists and chemical engineers have succeeded in building a new industry capable of producing in a year as much synthetic rubber as the whole world consumed of natural rubber in any year before 1941. Up until the beginning of the war period a few thousand tons per year of specialty rubbers such as thiokol, koroseal, and neoprene represented the entire synthetic rubber industry. This country was wholly dependent on imported natural rubber for its tire, tube, footwear, and other fabricating industries. By 1945 the capacity of synthetic rubber plants had reached one million long tons, and a production of 1.2 million long tons has been scheduled for 1946. In 1944 nearly 800,000 long tons of synthetic rubber were synthesized, of which about 90 per cent was of the Buna-S or GR-S type.

In this connection it is interesting to note that the production of neoprene, the first successful synthetic rubber developed in this country fifteen years ago, increased about ten fold over the 1941 figure. Approximately 110,000 long tons of natural rubber were consumed, drawn partly from the prewar stockpile and partly from very limited importations. The end of the war saw the supply of natural rubber on hand reduced to around 100,000 long tons.

This almost miraculous feat of industrial production was accomplished by selecting a single process and centering all efforts on that process. Butadiene, made from alcohol and from refinery gases, and styrene, made from coal-gas benzene and ethylene from alcohol or refinery gases, are combined in the proportions of 3 to 1 in the presence of soapy water containing minor amounts of chemicals to form a latex, which is later coagulated to a mass of crumbs. The most recent process is a continuous one, considerably increasing the rate of production. The larger part of the equipment and operations in this process is required in making butadiene and styrene.

The product, Buna-S or GR-S rubber, is not an exact replacement for natural rubber. In some respects the new material appears to be superior and in others it is not equal to the natural product. When it is remembered that the industry has had a hundred years experience in compounding and fabricating natural rubber as contrasted with not more than three years with the new product, comparisons between the two are somewhat premature. Certain phenolic resins have been employed to overcome the stiffness of mixtures containing synthetic rubber from which hard rubber is to be made. Alkyl phenol sulfides have proved to be somewhat better vulcanizing agents than sulfur for Buna-S and Buna-N rubbers, but have no advantage over sulfur with neoprene or natural rubber.

An important ingredient in the manufacture of rubber products is reclaimed rubber. This is not wholly a substitute for new rubber, but is essential because of its own peculiar properties in the making of certain types of rubber products. The technology of reclaiming scrap and waste rubber made from the natural variety is not wholly applicable to reclaiming synthetic rubber, but considerable progress has been made in

adapting former methods and developing new ones for synthetic "reclaim."

Synthetic Buna-S latex is not yet equal to the latex obtained from Hevea trees, but considerable quantities are being used, the consumption being probably up to one third of the prewar figure for natural latex. An important use is in impregnating cotton and rayon tire cord. An improvement in preparing synthetic latex consists in making the dispersed particles larger so as to compare in size with those of the natural material.

Butyl rubber, made by copolymerizing butadiene and isobutylene, is a material in which there is relatively little unsaturation. This new rubber, which is strictly an American product, is specially suited to the manufacture of inner tubes for tires. These tubes hold air much better than those made from any other type of rubber, and also hold helium remarkably well. Substitution of helium for air in large airplane tires means a noteworthy saving in weight.

Silico-Organic Compounds.—Compounds in which both silicon and carbon are combined with hydrogen, oxygen, chlorine, and other elements continue to prove extremely useful. Tetraethyl orthosilicate hydrolyzes in water to produce a highly resistant amorphous silica which is very useful in the ceramic industry as a bonding agent for molds in which metal castings are poured, for refractory crucibles, for porous silica articles, and for solid fuels, and also as an ingredient of heat-resisting paints and of lacquers that are to adhere to glass.

A silica aerogel, made water-repellent with silico-organic compounds, functions as a heat-insulating material. It has the appearance of snow, pours freely, has a density of 3 pounds per cubic foot, and is twice as effective a heat insulator as cork. It may be used in blankets and sleeping bags, and in garments in which it is held between layers of uncut velvet with thermoplastic stitching. It may take the place of carbon black in rubber, and in camouflage paints it breaks up light rays and gives a dull sheen.

Silicone greases are not only highly effective valve lubricants but function as an insulating material around spark plugs. Silicone rubbers are commercially available for molding, extruding, coating, and laminating. They are elastic between -70°F. and 500°F. Used either alone or as coatings on asbestos and glass they resist heat and have high dielectric constants, and are not affected by oil or brines.

Other Plastics.—Wartime use of plastics of all types has resulted in a peak production of over 400,000 tons per year, which is nearly one half the 1944 production of synthetic rubber and considerably more than magnesium. Plastics do not appear in considerable quantities in any large manufactured article but are components of adhesives and protective coatings, and the material of which an infinite variety of smaller articles are made. Probably the largest single units in which they appear are the transparent noses and turrets of aircraft. Very few new types of plastics have appeared during the war years, but there have been many variations and improvements in those already developed.

The great contributions of plastics to the coating, wrapping, and packaging of war supplies have already been referred to. Plastics have made possible extremely smooth surfaces of airplanes which consequently have less wind resistance. External rivets are countersunk, cracks are filled with putty of a special type, the sur-

face coating is sanded, and an airfoil lacquer is sprayed on with the proper type of thinner to allow flow to a smooth film, which is dried and polished to a glass finish. Such coatings are flexible, even at very low temperatures, and highly resistant to gasoline and hydraulic and deicing liquids.

Cold-setting formaldehyde-resorcinol plastics are proving very useful in bonding wood, being mixed with a hardener before application. Large prefabricated sections that can not be placed in a press are held together by such cold-setting resins. Other plastics of a related type set at temperatures as low as 140° F., and are especially valuable in heavy laminated timbers, parts of small boats that are heavily stressed, and in grinding wheels. Metal surfaces may be bonded together when treated with primary coats of thermosetting resins.

Furan-base resins function as an ingredient of mortars for acidproof masonry and have an initial set of 20 to 30 minutes. In 2 to 3 days they reach their full cure and are highly resistant to alkalis, oils, solvents, and most acids except concentrated oxidizing acids.

Glass bottles containing dangerous chemicals are being coated with plastics so that the shape of the bottle is retained even if the glass is cracked or shattered, thus giving time for the transfer of contents.

Plastics continue to be useful as a coating for textiles. A very thin and invisible coating of vinyl butyral resin on fabrics does not alter their feel or appearance but permits the washing off of stains without wetting the fabric. Synthetic resins on cotton cloth serve as flame-proofing agents, the cloth charring when heated but giving no afterglow when the flame is removed. Cotton cloth may be coated with a synthetic plastic until it is only porous enough to permit small quantities of water to soak through. Such fabrics take the place of flax in water bags whose contents are cooled by evaporation. Many thousands of such bags have been made during the war.

Drugs, Insecticides, and Agricultural Chemicals.—While several new sulfa drugs and other pharmaceuticals were developed during the war period and the manufacture of standard materials was greatly increased, interest has been centered largely on the new antibiotics derived from the growth of molds. The production of penicillin in 1945 is estimated as being between 8 and 10 tons. Since the broth removed from the solid products of molds contains only about 50 parts per million of penicillin and several intricate steps are involved in the process including final drying at extremely low pressures and temperature, the magnitude of this industry can be readily appreciated. Streptomycin is another antibiotic that, it is hoped, will greatly supplement penicillin by preventing the growth of such disease germs as those of typhoid fever, dysentery, tularemia, and whooping cough, all of which are immune to penicillin. Clinical tests are now being carried on extensively to determine the effectiveness of streptomycin.

The chief antimalarial which was manufactured and furnished to troops in subtropical and tropical climates was atabrine. At the same time the War Department developed small portable types of quinine extraction plants that could be used on wet bark in the forests. Some of these employed ion-exchange resins while others depended on the use of such locally obtainable materials as vinegar as a source of acid and the leachings of wood ashes for alkali.

The insecticide, dichloro-diphenyl-trichloroethane, commonly known as DDT is now on sale for domestic use after having protected millions of soldiers and whole populations against typhus and other plagues in the war area. Production of this material rose in 1944 to 12,000 tons.

An absorbable type of cellulose, announced in 1941, reached full-scale use in military hospitals by the end of the war. The flow of blood is stopped by formation of a gelatinous clot. Gauzes of this material do not have to be removed from wounds. The material is made by the oxidation of cellulose by nitric acid, hydroxyl groups being converted to carboxyl groups in the process. As much as 85 per cent of the original strength of the fiber is preserved.

Synthetic margaric acid, $C_{17}H_{34}O_2$, is made from cetyl bromide and sodium cyanide with subsequent hydrolysis. The acid, or its glycerin ester, functions as a fat, but does not give toxic acetone bodies in cases of severe diabetes, as do fats which are esters of acids made up of an even number of carbon atoms.

The killing of rodents has been made easier by two chemicals, sodium fluoroacetate and alpha naphthyl thiourea. In the dilutions used, sodium fluoroacetate has little danger of poisoning human beings. It is not a cumulative poison and is not absorbed through the skin. It is, however, dangerous to pets and livestock and its use is likely to be confined to professional rodent killers and to being placed in prairie dog holes. The alpha naphthyl thiourea is also not particularly dangerous to humans. Dogs are reasonably well protected since the drug induces vomiting with this type of animal. The common Norway or gray rat is peculiarly susceptible to this chemical, which causes a dropsy of the lungs. The use of rats as laboratory test animals led to the discovery of their sensitiveness to this chemical.

Pyridinylmercuric stearate has been found to be an excellent fungicide and bactericide with water-repellent properties. It can be incorporated into oils, varnish and lacquer solvents, and waxes, and is most effective in fungus-resisting paints and in mildewproof textiles, in greases attacked by tropical organisms, and as an antiseptic in cutting oils.

Magnesium oxychloride cements containing copper, already useful for their germicidal and fungicidal properties, have now been found to repel roaches.

In the field of agriculture, naphthalene acetic acid will not only prevent premature dropping of apples, but is most effective in thinning blossoms. The chemical, 2,4-dichlorophenoxyacetic acid, is proving a most effective weed killer without injuring grass or growing grain. It is applied in dilute solution as a spray.

A fused mixture of rock phosphate, potassium carbonate, and silica, to which small amounts of other essential elements have been added, when finely ground, can be added to soil to furnish all the substances, besides water, air, and nitrogen compounds, that are needed for the growth of plants. The advantage of this material over other fertilizers lies in the complete control of solubility.

CHEMOTHERAPY. See CHEMISTRY; MEDICINE, PROGRESS IN; MELLON INSTITUTE; TROPICAL DISEASES.

CHEMURGY. Fabric made from chicken feathers was among the more interesting chemurgic achievements during 1945. While commercial production had not begun, the experimental work reached a stage that justified a large manufacturing company (United States Rubber) in announcing the product.

While "light as a feather" is metaphorically accurate, the annual supply of chicken feathers in the United States is at least 50,000 tons. Turkeys yield another 15,000 tons. The total is a quantity of raw material not to be ignored. A large proportion of this tonnage is economically available; the feathers are concentrated in central locations where the fowls are dressed for market. Heretofore they have mostly been wasted and, in fact, have presented a disposal problem. The fowls are plucked wet, and wet feathers decompose with alacrity.

Rapid decomposition was the first problem to be solved before feathers could be useful as an industrial material. It was found that .55 of a pound of salicylic acid, 1.1 pounds of benzoic acid in 30 gallons of lukewarm water prevented decomposition. Another solution, using the same amount of water with 15 pounds of common salt and a pint of commercial concentrated hydrochloric acid, has been reported effective. At any rate, means were found for safe preservation and transportation of wet feathers.

For fiber making the barbs are removed mechanically from the quills which, so far, are discarded. The barbs are then dissolved in solution of heavy chemicals from which about two-thirds of their weight is recovered in the form of a thick syrup. This syrupy material is extruded through spinnerets, as in making other synthetic fibers. A chemical bath stabilizes the fibers which are then made into yarn. Eighty per cent of each feather, and three-quarters of the feathers from a fowl are said to be usable.

According to the company announcement, the fabric is softer and lighter than wool which it resembles; it can be dyed; is odorless; and presents a brilliant luster. The fabrics made so far have mixed 60 to 70 per cent of the feather fiber with other standard textiles. Like wool, feathers are a protein structure. Plastic materials have been made experimentally. Surgical sutures may be another product of the feather protein, since such a thread because of its composition would be absorbed by the body, making removal of stitches unnecessary.

Ramie.—Although ramie has been grown and used for thousands of years, not until 1945 did genuine promise appear for commercial abundance of this remarkable natural fiber. The baffling problems of machi e decortication and degumming appear to have been solved after nearly a century of numerous efforts.

Ramie is a semi-tropical plant of the nettle family which grows three to eight feet high. Propagated by root cuttings, three or more crops annually may be harvested from the stalks, and four to seven years may elapse before new plantings have to be made. The stalk contains pith, surrounded by a layer of inner bark. Here the fiber is imbedded in gums and pectins which have been extremely difficult to remove. Oriental laborers, working by hand methods, have been able to produce no more than three or four pounds of clean fiber daily. The operation has until now remained at a stage comparable to that of cotton before the invention of the gin. The gums adhere and dry, and then become even more difficult to remove.

While details of the new machines have not been made public, it is presumed that the solution has been found in green decortication accompanied by heavy streams of water to wash out the gums and pectins.

Newport Industries are planting their second thousand acres in Florida, have constructed a \$150,000 plant, and have announced commercial fiber production for the fall of 1946. Several other interests have made investments which indicate confidence in their ability to market fiber.

Ramie is a long fiber, stronger either wet or dry than most other natural or artificial fibers, with a dozen or more attractive qualities which assure a market for large quantities.

Waxy Corn.—Acreage of waxy corn, the maize from which starch chemically identical with cassava starches is produced, was further increased in 1945. Demand for adhesives and for food-stuffs resembling tapioca extended the milling industry's requirements for this specialized corn variety. A premium is paid because the corn must be kept separate from regular varieties.

Natural Rubber.—End of the war and prospect of tropical rubber, and availability of synthetic rubber, checked progress in development of guayule, the southwestern desert shrub, and of kok-saghyz, the Russian dandelion, as American sources of natural rubber. It was expected, however, that interest in both would continue active.

WHEELER McMILLEN,

Editor in Chief, Farm Journal.

CHENNAULT, Claire Lee, United States Army Air Force officer: b. Texas, Sept. 6, 1890. On July 15, 1945, Major General Chennault relinquished his air command after eight years of helping China fight her war with Japan—first as Chiang Kai-shek's aviation adviser, later as chief of the American Volunteer Group or the "Flying Tigers," and finally as commander of the United States Fourteenth Air Force. On Oct. 31, 1945, he retired from the army, ending a 25-year career of active service. Press dispatches covering General Chennault's resignation from his China post pointed out that he had never felt his airmen got their proper share of supplies reaching China through India. Said *Newsweek* magazine (July 23, 1945), "from December of 1941 when a handful of Tigers had helped keep the Burma Road open, one of his greatest talents had been knowing how to fight patiently on a shoestring (Chennault always managed to keep his obsolete planes flying) . . . his patience wore out."

In the First World War, General Chennault served with the Signal Corps Reserve's aviation section, and in 1920, was commissioned first lieutenant in the army's air service. Between the two wars, his duties were varied and included a number of teaching assignments at army flight training schools throughout the United States. He holds the Distinguished Service Medal, the Distinguished Flying Cross, and the Army, Navy, and Air Force Medal (Chinese); he is also a commander of the Order of the British Empire.

CHERNYAKHOVSKY, Ivan Danilovich, Soviet Army officer: b. Ukraine, Russia, 1908?; d. of wounds received on the battlefield of East Prussia, Feb. 18, 1945. The youngest and one of the most brilliant Soviet generals, Chernyakhovsky led the Third White Russian Army, which was the first to invade Germany in 1944. He was responsible for the liberation of Minsk, Vilna and Kaunas, and the conquest of nearly all of East

Prussia. General Chernyakhovsky entered the army as a private and rose rapidly from a colonelcy in 1942 to the rank of major general in the winter of 1943, and was designated colonel general in March 1944. As a tank expert, he helped defend Voronezh in 1942, and was made a Hero of the Soviet Union for the crossing of the Dnieper in October 1943. It was his troops that liberated Kiev in November 1943.

On June 27, 1944, he received command of his own army. In the Russian drive that began in the summer of 1944, General Chernyakhovsky and Gen. Ivan Bagramian were assigned to clear the way for a westward offensive along the highway to Minsk and Warsaw, with Berlin as the ultimate objective. After the encirclement and fall of Vitebsk, the most strongly fortified Russian city held by the Germans, Marshal Stalin elevated Chernyakhovsky to the rank of a full general. Three days before his death, he was the subject of an order of the day by Stalin for his troops' gallantry in the battle of East Prussia. He was the recipient of more orders of the day from Stalin than any other general in Soviet history. Plans to erect a monument in his honor at Vilna were announced at the time of his death.

CHERRIES. The Department of Agriculture estimated the 1945 cherry crop of the United States at 133,360 tons as compared with the 1944 crop of 202,090 tons and the 1934-43 average crop of 153,141 tons. Washington, California and Oregon were the leading producing states in 1945 in the order mentioned. The 1945 crops were given as 34,500 tons; 31,900 tons and 22,900 tons respectively. In 1944 they produced respectively 29,100 tons; 27,000 tons and 20,700 tons. New York was the next largest producer with a crop of but 9,900 tons in 1945 against a 1944 crop of 25,000 tons, and a 1934-43 average crop of 20,535 tons. Michigan produced but 9,300 tons in 1945 against 54,600 tons in 1944 and a 1934-43 average production of 35,610 tons.

CHESS. See **SPORTS** IN 1945.

CHIANG KAI-SHEK, Chinese statesman and general: b. Chikow, District of Fenghwa, Chekiang Province, China, Oct. 31, 1887. Generalissimo Chiang Kai-shek continued to be throughout 1945 the acknowledged military and political leader in China, despite renewed tension between his Chungking government and the Chinese Communists. On March 1, 1945, he announced plans for the convention in November of a national assembly, representative of all political parties, to draw up a constitution. On May 19, his resolution to legalize all political groups was approved by the National Kuomintang Congress. He resigned his post as China's premier on May 31 in order to devote his full attention to prosecution of the war with Japan. In mid-August, Communist Gen. Chu Teh was reported to have refused to comply with General Chiang Kai-shek's order to the Eighteenth (Communist) Army Group to remain inactive instead of disarming Japanese troops. On August 15, Chiang issued his first invitation to Communist leader Gen. Mao Tzetung to meet with him in Chungking for discussion of Nationalist-Communist differences. It was not until August 26, after reported clashes between government and Communist troops in Shansi Province, that Chiang Kai-shek prevailed upon Gen. Mao Tzetung to consent to a Chungking conference. On

September 3, in his victory message to the Chinese people, he asked that China be rebuilt as "a model democratic state in the Far East," and added that the government would "brook no delay in the inauguration of a constitutional policy." He further pledged to the Chinese higher standards of living, greater employment, farm land grants for war veterans, and freedom of speech and of person to all.

CHICAGO NATURAL HISTORY MUSEUM (formerly **FIELD MUSEUM OF NATURAL HISTORY**). The most important accomplishment of this museum in 1945 was the completion and opening to the public of a new Hall of Whales, in July. More than two years had been spent in preparation of this hall, in which are represented most of the distinct types of whales of all the world's seas and oceans—approximately half of all species and subspecies known to zoologists. The large whales are illustrated by meticulously accurate models one-tenth life-size; small species by life-size models. The hall is embellished by a series of mural paintings by Staff Artist Arthur G. Rueckert illustrating various phases of the life of whales, as well as a scene portraying the bagging of a giant sperm whale in the days of the sail-propelled whaling ships.

A diorama depicting a typical Inca village in an Andean valley as it appeared before the conquest of Peru by the Spaniards in 1532 is the principal addition to the exhibits in the Department of Anthropology.

Other additions were made in various divisions of the departments of anthropology and zoology, and also in the departments of botany and geology. A series of special exhibits at various periods of the year attracted wide public attention. Meeting interest aroused by the atomic bomb, a special exhibit was installed of uranium and the minerals from which it is derived, and other minerals from which radioactive elements are obtained. Other special exhibits included one co-ordinating museum material with exhibits supplied by the government of the Dutch East Indies; the famous "Animals in Miniature" by the noted taxidermist and sculptor, Louis Paul Jonas, of Lake Mahopac, N. Y.; and one commemorating the 160th anniversary of the birth of John James Audubon.

The wartime ban on expeditions was continued, but with the ending of the conflict, plans were begun for future research in foreign regions. Actual resumption of expeditionary work, however, may continue to be delayed for some time, as many of the members of the staff who would participate are still in the armed forces of the United States.

Col. Clifford C. Gregg, director of the museum, who had been on active service with the army since September 1940, was released from his military duties and returned to the museum post on May 14, replacing Orr Goodson, acting director, who resigned to accept a position elsewhere.

Plans for co-operation in fields of mutual interest were ratified by the boards of trustees of the museum and the University of Chicago; and a similar arrangement is in development with Northwestern University. By this means, students of the universities will derive greater benefits through co-ordination of the museum resources with their curricula; and the staffs of the institutions will co-operate in research.

Attendance at the museum up to the time of this writing (September) continued close to the average of recent years, although falling off slightly from 1944.

CLIFFORD C. GREGG,

Director, Chicago Natural History Museum.

CHICKEN FEATHER FABRICS. See CHEMURGY.

CHIFLEY, Joseph Benedict, Australian premier: b. Bathurst, New South Wales, Australia, Sept. 22, 1885. On July 12, 1945, Mr. Chifley was elected prime minister of Australia to succeed the late John Curtin. He became the sixteenth prime minister of Australia, replacing the head of the interim regime, Francis M. Forde. Mr. Chifley left school at an early age to enter the New South Wales State Railway service, and in time, became a locomotive engineer on the Blue Mountains run. During this period, he was an active member of the Australian Railways Union, and developed a keen interest in labor politics. Before his entry into federal politics, he studied economics, finance, and industrial law, and practiced as advocate in state and federal industrial arbitration courts.

Mr. Chifley, who represents the constituency of Macquarie, entered the Australian Parliament in 1928, in the same election as the late Mr. Curtin, and the next year received his first portfolio as defense minister in the Scullin labor government. He lost his seat in Parliament in 1931, but by reason of his talent for financial administration, was retained in government service. In 1935, he was appointed a member of the Royal Commission on Monetary Banking Systems, and in the course of its sittings, he crystallized those opinions that later found expression in the Curtin government's radical banking legislation, of which Mr. Chifley was the chief architect.

At the outbreak of the Second World War, he was appointed director of labor in the newly formed Ministry of Munitions, and was also named a member of the Capital Issues Advisory Board. He returned to federal politics with the labor swing in the general elections of 1940. His financial experience made him an obvious choice for the post of treasurer when Curtin's first labor government was formed in October 1941. With the creation in 1942 of the Ministry of Postwar Reconstruction, Mr. Chifley was appointed its first minister. He held the portfolio, as well as that of treasurer, until early February 1945, when in a Cabinet reshuffle, postwar reconstruction was entrusted to John Dedman.

He was acting prime minister for a period during Mr. Curtin's illness and the absence abroad of Deputy Prime Minister Francis Forde, who headed Australia's delegation to the San Francisco World Security Conference. Mr. Chifley has earned a reputation for firm adherence to the policy of his party, and praise from all quarters in Australia—from leading bankers for his handling of Australia's finances during four difficult war years; from treasury officials who have voted him the country's greatest treasurer; and from the Australian public, despite the fact that in August 1942, he brought down the toughest budget in Australian history.

CHILD LABOR COMMITTEE, National. Organized in 1904 and incorporated by act of Congress in 1907, the purpose of the Child Labor Committee is to aid in protecting children and youth against harmful employment and in guiding them into suitable employment under the most favorable conditions.

Recent Data on Child Labor.—The end of the war and industry's reconversion to peacetime conditions found agencies concerned with problems of child labor prepared with broad policies and constructive programs for the education, training, and protection of young workers. In April 1944 about one third (2,900,000) of the total number of boys and girls 14 to 18 years of age (9,200,000) were in the labor force. Of these approximately 3 million young workers, 2 million were boys, 1 million girls. The 14 and 15 year olds make up 850,000 of these 3 million, boys outnumbering girls three to one in this age group. The number of 14 and 15 year old workers increased fourfold from April 1940 to April 1944 (209,347 to 850,000), while the 16 and 17 year workers increased three times (662,967 to 1,950,000). The number of children under 14 at work does not appear in these data from the Children's Bureau of the U.S. Department of Labor, but they were a noticeable group in many communities. The number of persons between the ages of 14 and 18 at work during the summer months of 1943 and 1944 was estimated to be 5 million.

In New York City, the Attendance Bureau of the New York City Schools, reported that the issuance of full-time employment certificates rose from 35,462 to 70,802 between 1941 and 1945 (the peak was 81,336 in 1944) and these went, for the most part, to non-high school graduates. The Bureau of Labor Statistics in Washington reports that the labor force in April 1944 had seen an increase since 1940 of 6,700,000 workers in excess of normal. The age group, 14 to 18 years, accounted for 1,730,000 of this excess, or roughly one fourth (1,090,000 boys and 640,000 girls). Four main industry groups claimed nine tenths of the 14- to 18-year-old labor force: agriculture, wholesale and retail trade, manufacturing and domestic and personal service. Agriculture is the largest classification for the 14- and 15-year-old group, manufacturing and trade for the 16- and 17-year-old group.

School Attendance of Young Workers.—High school enrollment in the United States, which had seen a steady increase up to 1940, fell about 14 per cent in the war period. According to U.S. Office of Education reports, this was a loss in enrollment of about 1 million students, from a total of 7,244,312 in 1940-41 to a total of 6,216,119 in 1943-44. Of the 3 million children, 14 to 18 years old, in the labor force in April 1944, about one half had left school to work full time and one half (1,400,000) worked part time while attending school. Boys constituted 1 million of these 1,400,000 part-time workers. In all age groups for both full-time and part-time categories, a greater proportion of farm boys than nonfarm boys were at work.

National-Go-to-School Drive.—National "Go-to-School" drives were organized in the summer of 1944 and again in the summer of 1945. Some measure of the success of the 1944 campaign may be seen in the fact that the continuing decline in wartime high school enrollment which had gone on since 1940 was so far curtailed that the decline in the fall of 1944 was, according to the Children's Bureau, "almost negligible."

Violations of Child Labor Laws.—From all parts of the country evidence continued to accumulate of widely prevalent violations of state and federal child labor laws. The North Carolina Labor Department showed 22 times as many child labor law violations in the first six months of 1944 (7,576) as in the first half of 1940 (340). New

York State showed 11,809 violations from May through October 1944, as compared with 2,452 violations in the whole year 1940. Other states report similar striking increases. Largely as a result of vigorous efforts by the New York State Department of Labor to enforce the child labor law, the number of youth, illegally employed in the state, dropped from 4,871 in the two months May-June 1944 to 1,770 for the period May-June 1945.

The Children's Bureau, administering the Federal Fair Labor Standards Act, found in the three months of July, August, and September 1944, an increase of 100 per cent over these three months of 1943 in the number of young workers illegally employed (2,327 minors in 824 establishments as against, in 1943, 1,064 minors in 406 establishments). In general, the Children's Bureau reports, "more than seven times as many children were found to be illegally employed under the child labor provisions of the Federal Fair Labor Standards Act in 1945 as in the year 1941. These violations occurred in more than six times as many establishments."

Health and Accident Hazards.—Illegal child labor has resulted in a rise in the number of industrial accidents as reported in many sections of the country. In New York City, 548 double indemnity awards were made to minors injured while illegally employed in 1944, as compared with 289 such awards in 1943. Illinois reported a 100 per cent rise in the rate of industrial accidents to young workers in 1943 as compared with 1942, Michigan a rise of 211 per cent. In one state (North Carolina), the accident rate rose 1,100 per cent between 1940 and 1943; and over 1,300 per cent in another state (Pennsylvania).

Delinquency.—No one factor alone has caused the rise in juvenile delinquency noted during the war years. Excessively high earnings or the employment of young people in jobs "morally hazardous" may be seen as possible factors in this rise. Young teen-age girls working as waitresses or as curb hops in questionable eating places, or as usherettes, or young boys employed in poolrooms and bowling alleys are sometimes exposed to conditions conducive to delinquent behavior.

Boys and Girls Employed in Agriculture.—The Children's Bureau report on young agricultural workers in 1944 shows but slight improvement over previous years in the working conditions of children on farms. Nonfarm boys and girls employed on farms worked on a day-haul basis, living at home and working by day. For the most part these day-haul programs remain unsupervised. Some children under 14 (the minimum age recommended) were employed, some as young as 9 years of age. Earnings were generally low, and hours of work were unregulated and long. Housing conditions in farm work camps were reported to be better in 1944 than in the previous two years.

Child workers in migratory families continue to live and work at substandard levels. These children still need more sanitary living conditions, and legislation to protect them from exploitation and loss of educational opportunity. The most direct way to accomplish this, since migratory families work in several states during the year, would be to amend the child labor provisions of the Fair Labor Standards Act making it apply to commercialized agriculture throughout the year, instead of only while schools are in session.

New Jersey took action in 1945 to improve

the conditions under which migrants work by establishing a division of migrant labor in its department of labor. The efforts of various agencies dealing with migrant workers are co-ordinated under the act. An appropriation of \$100,000 is provided to administer the program to provide decent living quarters, health and welfare services, educational opportunities, and fair labor standards for migrant workers.

State Legislation.—Bills to improve child labor and compulsory education standards were introduced in many of the 42 state legislatures which met in 1945, but only a few became law. The National Child Labor Committee prepared a pamphlet for use in state legislative campaigns seeking to raise the minimum age for all employment to 16 during school hours and for factory employment at any time. Thirteen states already have such laws. Several such bills were introduced in the 1945 legislatures, but only in Illinois was the legislation passed, to become effective six months after the war. Georgia and North Carolina raised the required school attendance age from 14 to 16 (in North Carolina the age will be 15 for 1945-46 and 16 thereafter). In New York, a bill was passed to become effective Jan. 1, 1946, limiting part-time work hours after school as follows: children under 16 may not work more than 3 hours on any school day, 8 hours on a nonschool day, 23 hours a week when school is in session; 16-year-olds may not work more than 4 hours on a school day, 8 on a nonschool day, and 28 a week when school is in session. Only nine states have similar laws limiting the hours of part-time work.

Postwar Considerations.—The Bureau of Labor Statistics estimates that by 1947 there will be a surplus of 5,000,000 to 6,000,000 workers on a basis of civilian jobs as of 1941. If young people who have not finished high school remain in the labor market and if others continue to leave school in the future with only a year or two of high school education, they will add to the amount of unemployment by competing with adults for work, and they will not have the preparation either as workers or as citizens that will be needed in the coming decades.

The National Commission on Children in Wartime also made recommendations during the past year for working youth in the reconversion and readjustment period, particularly for older youth who are unlikely to return to school. These included: job placement services to aid them in their search for employment; programs that would give to young people the opportunity to combine work and school in such a way as to serve their long-run interest; employment of youth on public service projects, such as soil and forest conservation; skilled employment counseling services, to help young people make their choice of jobs, training courses and educational opportunities.

Labor unions, both the American Federation of Labor and the Congress of Industrial Organizations, have set forth resolutions seeking to readjust young workers in the postwar period.

Services and Publications.—The newly organized Child Welfare Information Service with offices at 930 F Street, NW., in Washington serves as a clearing house on federal legislation and activities in the field of child and youth welfare. Organizations working in these fields may subscribe to the service. Bernard Locker is executive secretary. Mrs. Eugene Meyer is president, and George J. Hecht is vice president and treasurer.

The National Child Labor Committee (419 Fourth Avenue, New York 16, N.Y.) offers information on child labor conditions, including changes needed in the provisions and administration of child labor and compulsory attendance laws. It co-operates in drafting and procuring the passage of legislation, publishes educational material, and carries on activities to promote better educational and employment opportunities for youth.

In 1944-45, the National Child Labor Committee issued the following publications:

The American Child (published monthly except in summer); *Annual Report*, for the year ending Sept. 30, 1945, by Gertrude Folks Zimand; *State Child Labor and Compulsory Education Legislation—1945*, by Louise D. Stetter; *The Long Road: Fortieth Anniversary Report of the National Child Labor Committee*, by Florence Taylor (October 1944); *The Changing Picture of Child Labor*, by Gertrude Folks Zimand (reprinted from November 1944 issue of *The Annals*); *The Case for Sixteen Year Employment Laws*, by Florence Taylor.

RUTH MALLAY,
National Child Labor Committee.

CHILDREN'S BUREAU, Federal. As the agency of the federal government devoted to the interests of children, the Children's Bureau of the Department of Labor carries research and policy-making functions and administers the child-labor provisions of the Fair Labor Standards Act of 1938 and the maternal and child-welfare programs of the Social Security Act. It also participates in the State Department's program for inter-American co-operation and in international movements related to child welfare.

Research and Policy-making.—Child Health.—The number of live births registered in 1944 was 2,794,800, according to the Bureau of the Census, a drop of 140,060 from 1943 when births reached a wartime peak. The provisional birth rate for 1944 was 20.2 per 1,000 population, compared with 21.5 in 1943. The infant mortality rate was reduced slightly in 1944—from 40.4 deaths of infants under 1 year of age per 1,000 live births to 39.8. A special campaign for more complete birth registration was conducted jointly by the Children's Bureau and the Bureau of the Census in connection with May Day-Child Health Day 1945.

The bureau revised two of its basic bulletins for parents (*Infant Care* and *Your Child From One to Six*) and issued pamphlets on cultivating good eating habits, traveling with a baby, the importance of birth registration, and books for children.

Information on the administration and content of school health programs was gathered at the request of state and territorial health officers, and the Children's Bureau, the United States Office of Education, and the United States Public Health Service agreed on a policy statement regarding improvement of school health services. The facilities of 20 hospitals were studied with a view to providing postgraduate training of doctors and nurses in the care of premature infants. Far-reaching recommendations on dental care for children were made at a conference of experts held in February 1945, and the following summer an adviser on dental services was added to the bureau staff to conduct research and give consultation service to state health agencies.

A mental health unit was established in the bureau in September 1944 under the joint direction of the chief, the associate chief, and the division directors. This unit explored mental-health services available to children through state health and welfare agencies and offered consultation services to states planning to initiate or

strengthen services in child psychiatry, clinical psychology, and psychiatric social work.

Social Service.—Among pressing problems resulting from war conditions were those of unmarried mothers and their children, including the placement of babies for profit, placement across state or national boundary lines, births out of wedlock occurring to wives of men serving overseas, shortages of foster homes, and inadequate maternity-home facilities for Negro mothers. Juvenile delinquency continued to be a problem of widespread concern, although preliminary reports from 225 courts indicated a slight decrease (5 per cent) in the number of delinquency cases disposed of in 1944 compared with 1943. Consultation service was given to state and community groups studying the causes and prevention of juvenile delinquency and the detention of children in jails. Postwar planning for leisure-time services envisaged expansion of recreation facilities to meet the needs of all children and youth, with special attention to children in migrant families, minority groups, handicapped children, and older adolescents. Work on guardianship problems begun the previous year was continued and expanded.

Employment Problems.—The number of minors under 18 at work during the school year 1944-45 was estimated at about 3,000,000. During the summer of 1945 the number rose sharply to approximately 4,500,000. Vigorous back-to-school drives conducted in the summer and fall of 1944 and again in 1945 by the Children's Bureau, the United States Office of Education, and the Office of War Information with the co-operation of many national and state organizations, were credited with checking the drop in high-school enrolments which amounted to over a million in the first 3 years of war.

A marked upward trend in injuries to workers under 18 during the war period was indicated in a number of states. To aid employers in selecting nonhazardous jobs for young workers the bureau issued advisory standards for the pulp and paper, textile, railroad, foundry, and brick and tile industries, bringing to 14 the total number of such standards issued during the war.

Four proposals for dealing with child-labor and youth-employment problems after the war were developed in consultation with other federal agencies: (1) full enforcement of existing laws; (2) revision of state laws where necessary to raise the minimum age for employment to 16 years for manufacturing establishments at any time and for any occupation during school hours; (3) educational allowances to take the place of unemployment-compensation benefits for young workers if they returned to school; and (4) student aid and other measures to help young persons complete their schooling. An Interagency Committee on Youth Employment and Education was set up with the chief of the Children's Bureau as chairman and took under consideration at its first meeting, in April 1945, a program of work and planning on questions of student aid, counseling, and work opportunities. A study of combined school and work programs was begun by the bureau and the U. S. Office of Education.

Administration of Federal Child-Labor Provisions.—The administration of the child-labor provisions of the Fair Labor Standards Act through a program for making certificates of age available for minors in industries subject to the act and through a program of inspection for compliance was continued. Employment or age certificates issued under state law in 44 states, the District

of Columbia, Hawaii, and Puerto Rico, were accepted as proof of age under the act, and in 4 states, federal certificates of age were issued by the bureau. According to reports received by the bureau, more than 1,500,000 minors 14 through 17 years of age, about one-fourth of whom were 14 or 15 years of age, were issued certificates for full-time or part-time work during the year 1944.

Inspections of establishments producing goods for shipment in interstate commerce disclosed 3,481 establishments (about 8 per cent of those inspected) employing minors under 18 in violation of the federal law, an increase of 19 per cent over 1944 and more than 100 per cent over 1943. In these establishments 13,289 minors were illegally employed, an increase of 58 per cent over 1944 and nearly 200 per cent over 1943. In order to spread understanding of the child-labor provisions of the act, the bureau consultants conducted child-labor clinics in some 40 sections of the country at which employers, representatives of state departments of labor and education, and labor unions had opportunity for forum discussion.

The Supreme Court on Jan. 8, 1945, reversing a decision of the lower courts, ruled that the child-labor provisions of the Fair Labor Standards Act did not apply to the employment of messengers by the Western Union Telegraph Company. This meant that telegraph messengers no longer were subject to the 16-year provision of the act, although they were still subject to state child-labor laws, and resulted in a marked rise in the number of employment certificates issued to 14- and 15 year-old children for such work.

Administration of Grants to States.—The programs administered by the Children's Bureau under title V, parts 1, 2, and 3 of the Social Security Act and the emergency maternity and infant-care program continued in operation in all states and territories, except that Utah did not take part in the child-welfare program. Payments to states from federal funds during the year ended June 30, 1945, were as follows:

Program	State agency	Payments
Maternal and child-health services	Health dept.....	\$5,553,000
Emergency maternity and infant care	Health dept.....	45,000,000
Services for crippled children	Crippled children's agency	3,874,000
Child-welfare services	Welfare dept.....	1,366,000

Except in the case of emergency maternity and infant care, these sums, supplemented or matched in large part state and local funds, and by no means represented the total amounts spent for the programs.

Emergency Maternity and Infant Care.—A total of 482,000 wives and infants of servicemen received medical, nursing, and hospital care during the year ended June 30, 1945, bringing to 884,000 the number of cases authorized for care since the first congressional appropriation for emergency maternity and infant care in March 1943. The funds were used by state health departments to pay doctors, nurses, and hospitals participating in the program for services rendered to maternity patients and infants for whom care was authorized. Those eligible were the wives and infants under one year of age of men in the four lowest pay grades of the armed forces and of aviation cadets.

Maternal and Child-Health Services.—The basic services provided under the supervision of

state and local health departments included prenatal clinics, child-health conferences, home nursing visits, school medical examinations, and nutrition, dental, and mental-health programs. For the most part the states were able to maintain existing services in spite of continued wartime shortages in professional personnel. Some states even began new programs for the care of premature infants or the improvement of nutrition.

A joint committee representing the Children's Bureau Advisory Committee on Maternal and Child-Health Services, the American Academy of Pediatrics, and the American Pediatrics Society drew up a report proposing "to make available to all mothers and children in the United States of America all essential preventive, diagnostic, and curative medical services of high quality which, used in co-operation with the other services for children, will make this country an ideal place for children to grow into responsible citizens." The American Academy of Pediatrics adopted this report in November 1944 and requested the United States Public Health Service and the Children's Bureau to join it in a survey in every state to determine the extension of personnel and facilities needed.

Services for Crippled Children.—All phases of the state programs for crippled children were reviewed at a conference of state directors of crippled children's agencies held at the Children's Bureau in November 1944. An outline was prepared to help state agencies in planning to meet poliomyelitis epidemics. Two states, Missouri and Montana, instituted services for children with rheumatic fever and heart disease, bringing the number of states conducting such programs to 18. California enacted legislation providing for services for children with hearing defects. In Texas the program for crippled children was transferred from the education department to the health department, making a total of 30 states in which this program is administered by the health agency. Medical-social services were strengthened in a number of states.

The number of crippled children admitted to diagnostic and treatment clinics and to public-health-nursing service increased in 1944; the number admitted to hospitals decreased slightly. The total number of children on state crippled children's registers rose from 364,000 in December 1943 to nearly 382,000 in December 1944.

Child-Welfare Services.—The range of services provided under the child-welfare program, in connection with which the bureau child-welfare consultants were called on, included development of broad programs of social services to children in local communities, day-care services for children of working mothers, licensing and supervision of foster homes and child-caring agencies, community programs for dealing with juvenile delinquency, services for unmarried mothers, supervision of adoptions, the use of recreation and group-work techniques, and the drafting of state legislation.

The wartime difficulty of obtaining qualified child-welfare workers continued. Reports from state welfare agencies as of July 31, 1944, indicated some 3,600 workers giving service to children, with more than one in six paid in whole or in part from federal child-welfare funds. There were 1,734 workers providing direct services to children on a full-time basis, but in many instances the program was limited to foster-care services and did not include services to children in their own homes.

Building the Future.—The keynote for developments after the war in the children's field was supplied by the National Commission on Children in Wartime, first appointed by the chief of the Children's Bureau in 1942, through a report issued in April 1945 after extended consultation with the various advisory committees of the bureau. This report, *Building the Future for Children and Youth*, contained proposals for action in the fields of child health, child welfare, adoption, family support, education, and child labor. Recommendations were made for continuous community planning for children and youth. Designated for immediate study were mental-hygiene services, problems of guardianship, leisure-time services, and a postwar program for youth.

KATHARINE F. LENROOT,
Chief, Children's Bureau, U. S. Dept. of Labor.

CHILDREN'S LITERATURE. Effects of the war were still apparent in both format and subject matter of children's books of 1945. However, there was an obvious thinking in terms of future peace and laying the foundations of international friendships and brotherhood of race and creed. The number of juvenile titles published during 1945 was 691; during 1944, 645. The scarcity of toys was reflected in augmented sales of children's publications and continuing popularity of the gadget books was noted. An enchanting animal tale, *Rabbit Hill*, by Robert Lawson, published in 1944, was awarded the Newbery Medal for outstanding distinction while memories of Kenneth Grahame, author of a beloved animal classic, were refreshed by *First Whisper* of "The Wind in the Willows," containing letters to his son, edited and charmingly introduced by Mrs. Grahame.

That picture books and stories were diverse in subject is shown by a few of the titles. *Ilenka* in Lee Kingman's story of that name was a little Russian girl, worried about her future. Lois Lenski's lilting *Spring Is Here* was as gay as the season. Irena Lorentowicz's illustrations distinguished the old Polish folk tale, *Nine Crybaby Dolls*, retold by Josephine Bernhard, and Lee Maril's *Mr. Bunny Paints the Eggs*. Among the books in which animals were the attraction were Morgan Dennis' *Burlap* about a dog, Marguerite Henry's *The Little Fellow*, important because of Diana Thorne's pictures of the foal, Carl Glick's amusing *Mickey, the Horse that Volunteered* of Spanish American War setting, and *The Grocery Mouse* by Eleanor Clymer. Earl and Linette Burton's *The Exciting Adventures of Waldo* featured a little, wooden duck. Emma Brock wrote and illustrated in humorous manner *The Umbrella Man*, and Louis Slobodkin produced a new account of an old friend in *Clear the Track for Michael's Magic Train*.

In the realm of folklore and fantasy Alfred Stuart collected tales from the Channel Islands under the title, *The Wizard and His Magic Powder*; and Ruth and Latrobe Carroll's *School in the Sky* was a nonsensical story of a group of children and their teacher who went on an airplane trip.

Youthful heroism in the face of Nazi aggression was the subject of a number of books, among which *Orange on Top* by Henrietta Van der Haas dealt with a Dutch family, and Ruth Kennell's *That Boy Nikolka* contained four narratives of Russia.

Not so dramatic but none the less real was the significance given by war conditions in our own country to Siddie Joe Johnson's *Cathy*, de-

prived of her parents' companionship by demand of the times; Elizabeth Janet Gray's story of *Sandy*, determined to make her contribution while the boys of her crowd were in the service and *A Sea Between*, in which Lavinia Davi told poignantly of a girl whose fiancé was over seas.

Outstanding among the good geographical titles were Ruth Brindze's pictorial and simple *The Gulf Stream* and *Sky Highways*, in which Trevo Lloyd offered an airplane study of 21 countries. In *Brazil*, *Giant to the South* Alice Hager wrote of the country and the people, and Evelyn Stefansson told of the Arctic regions in *Within the Circle*.

Two books dealing with the history and culture of other countries were *The Land of the Chinese People* (Portraits of the Nations Series by Cornelia Spencer (pseudonym) and *New Found World*, Katherine Shippen's distinguished picture of South America.

Fictional accounts of far away places with excellent background material were typified by *Two Lands for Ming*, in which Stanley Hon Chin and Virginie Fowler presented a little Chinese-American boy with a love for both his countries, and Florence Hayes' *The Eskimo Hunter*. Jean Bothwell's *Little Boat Boy* had Kashmir for a setting. Different in approach was Alan Crane's *Nick and Nan in Yucatan* with children from the United States visiting another country.

Several important books recognized the need for greater understanding at home. Among them *Melindy's Medal* by Georgene Faulkner and John Becker was a sympathetic, unself-conscious portrayal of a little Negro girl. In *The Very Good Neighbors* Irmengarde Eberle told of a family of friendly Mexicans, transplanted to Texas. Lorraine and Jerrold Beim's *Two Is a Team* gave youngest readers an attractively illustrated lesson in racial co-operation. For older boy and girls Florence Crannell Means' *The Movers* about the Japanese-Americans, uprooted after Pearl Harbor, had timely significance, and won for its author the 1945 Award of the Child Study Association of America. And in *Up at City High* a boy made a stand for the right in a large high school, Joseph Gollomb's gripping story of courage.

Biographies were largely heroic in tone. Out of the Second World War came, among others: Helen Nicolay's *Born to Command* about General Eisenhower; Ellsworth Newcomb's *Brave Nurse* composed of tales of various heroines; and John McNamara's *Extra! U.S. War Correspondents in Action*, including also journalists from other periods of history. Jean Burton's subject was *Gari Baldi, Knight of Liberty*, and Hildegard Hawthorne wrote of Patrick Henry in *Give Me Liberty*. Rose Brown's *American Emperor* was a distinguished account of the Brazilian leader, Don Pedro II. *We Have Tomorrow* by Arna Bontemps was made up of stories of young Negroes, finding a place for themselves in various professions. Of appeal to older girls was Beryl Williams' *Fashion Is our Business*, sketches of famous designers.

In spite of the pressure of the times there was an abundance of engrossing tales with historical background, of which the following title were representative. Elizabethan England was the scene of Magdalen King-Hall's adventurous tale of a runaway, *Sturdy Rogue*, while Constance Savery wrote of a boy's loyalty to Charles I in *Emeralds for the King*. Quaint customs of New Amsterdam were woven into Gladys Mal-

vern's romance of the little bound girl in *Jonica's Island*. The daring exploits of Roger's Rangers gave color to *I Become a Ranger* by Leon Dean. Katharine Gibson based *Arrow Fly Home* on the actual experiences of two children captives of the Shawnee Indians. For *Patriot in the Saddle* J. C. Nolan chose a period, darkened by the approaching War of 1812. *Henry's Lincoln* was Louis Neyhart's easily read account of a little boy's trip to the Lincoln Douglas debate. In *Stocky, Boy of West Texas* Elizabeth Baker wrote of adventures on the plains in the late nineteenth century.

Books of spiritual import were represented for little children by Eleanor Farjeon's *A Prayer for Little Things*, illustrated by Elizabeth Orton Jones, whose pictures in *Prayer for a Child* were awarded the 1945 Caldecott Medal. Olive Price's *A Donkey for the King* told of the little animal on which Jesus rode into Jerusalem. Background material was good in Sophia Fahs' *Jesus: the Carpenter's Son* while *Nathan, Boy of Capernaum* by Amy Lillie centered about a young contemporary of the Christ and his fascination with the new teaching.

The wonders of natural science were brought before the botanically minded in a number of beautifully illustrated volumes, of which Margaret McKenny and Edith Johnston's *A Book of Wayside Fruits* was a colorful example. Martha Bruère in *Your Forests* made the story of that resource most thrilling. Wilfred Bronson's *Turtles* contained a fund of humorous and authentic information for youngest readers, and Jerome Meyer's *Picture Book of Astronomy* was a fascinating study, easily grasped by the middle age group.

In the field of applied science David Cooke edited the useful *The Aircraft Annual*, and Herbert Zim's *Rockets and Jets* furnished readable data on advances up to now and future possibilities in this area. *The Story of War Weapons* through the ages was told by Marshall McClintock.

Barbara Geismer and Antoinette Suter compiled a collection of childhood poetry for varied occasions under the title, *Very Young Verses*. Primitive, childlike paintings by Russian children composed *Little People in a Big Country* with comments by Norma Cohn. Funny tales from various sources were selected by Margaret Scoggin for *Chucklebait*.

A number of stories dealt with the problems and interests of older girls. Noteworthy in this group was Marguerite Dickson's *Bramble Bush*, which made interesting reading about the friendship of two girls with serious personal difficulties. In the nonfiction Margaret Bro's *Let's Talk About You* was practical and to the point.

Some of the titles about boys who did things were Marjorie Allee's *Smoke Jumper* (forest fire fighting), Robert Davis' *Gid Granger*, a Vermont farm lad, and Henry Lent's *Ahoy, Shipmate!* following one youth into the merchant marine.

Devotees of mystery, who have become very vocal in their desires, were given a generous supply of their favorites of both middle age and older appeal. Some of the books were Myna Lockwood's *Lo and Behold!* with Cape Cod setting, Margaret Leighton's *The Singing Cave* in the Southwest, Mary Urnston's *Mystery of the Old Barn*, Leda Wadsworth's *The Bronze Arrow Mystery* about foul play in a bus company and Bert Sackett's *Hurricane Treasure*.

Many adult titles had an enthusiastic reading public among young people, who showed a seri-

ous interest in progress of the war and prospects of a sound peace.

OLIVE D. LEWIS,
Librarian, Gillette State Hospital for Crippled Children, Saint Paul, Minn.

CHILE. A republic of South America lying between the Andes and the Pacific, with an area (1940) of 286,322 square miles, not including territories in the Antarctic zone (see ANTARCTICA). The coastline is about 2,485 miles, and the average width of the country approximately 110 miles. Under Spanish domination for many centuries, Chile was proclaimed a republic in 1810, and succeeded in freeing itself from Spain in 1818. The constitution adopted in 1925 provides for a president, chosen for a term of six years by popular vote and eligible for immediate re-election. President Juan Antonio Rios, elected Feb. 2, 1942, began his six-year term on April 1. Legislative power is vested in a Congress of two houses—the Senate and the Chamber of Deputies. The Senate consists of 45 members elected for eight years, the Chamber of Deputies of 143 members elected for four years. There is suffrage in presidential and congressional elections for all male citizens over 21 years of age who can read and write; women, and foreigners of five years' residence having the vote in municipal elections. The state is divided into 25 provinces, presided over by *intendentes*; the provinces are divided into departments headed by *gobernadores*, and the departments are divided into municipal districts, each with a council. The estimated population (1943) is 5,191,027, the majority being of European origin. Native peoples include the Araucanians, inhabiting the Andean slopes and valleys; the Fuegians, who are mostly nomadic and live in the extreme south; and the Changos, who live in the north and are mainly manual laborers. The principal cities are: Santiago, the capital (pop. 1942, without suburbs, 696,000); and (according to the 1940 census), Valparaíso (215,614); Concepción (92,364); Temuco (84,696); Viña del Mar (70,013); Chillán (61,535); Talca (56,735); Antofagasto (51,107); and Valdivia (49,481).

Religion and Education.—Roman Catholicism was the state religion until 1925. All denominations are permitted and protected. The Roman Catholic Church has three archbishops (at La Serena, Santiago, and Concepción), 15 bishops, and two vicars apostolic throughout the republic. In 1931 there were 1,239 churches and chapels.

Education is free and compulsory for all children between the ages of 7 and 15. In 1939 there were 4,757 public and private primary schools with 611,494 pupils, 10 public and private normal schools with 1,764 pupils, 253 public and private secondary schools with 43,424 pupils, and 25 commercial schools with 6,441 pupils. In addition there were 151 schools giving special instruction to 32,176 pupils. Professional and higher education is provided by the State University of Chile, the Catholic University at Santiago; the National Institute of Santiago; the University of Concepción, the school of technology at Valparaíso (Universidad Industrial de Valparaíso) and in the lyceums and colleges established in the capitals of the provinces. University students in 1939 numbered 6,448. The federal appropriation for education in 1940 was 315,594,000 pesos.

Army and Navy.—Military service is compulsory for all able-bodied citizens from 20 to 45. Active service is usually for nine months. The country is divided into four military districts, each

of which furnishes a complete division when mobilized. The strength of the standing army in 1943 was about 212,000. In that year the total strength of the army was increased to 726,800, partly through the addition of motorized divisions. The air force was also increased to four brigades, one for each military district. The active strength of the navy is 8,000 men. In addition to training and auxiliary ships it includes one battleship, two cruisers, eight large destroyers, nine submarines, two coast defense ships, and two oil tankers. The construction of two additional cruisers of 3,000 tons was approved in 1939.

Communications.—Prior to 1944 total railway mileage was 5,200, of which 1,369 miles were privately owned, principally by foreign capital, and 3,785 miles were federal. During 1944 the State Railways took over operation of two private lines and a short feeder line. In 1945 the government was empowered to purchase the street railway systems in Santiago, Valparaíso, and San Bernardino (all of which had been government-operated for four years), and to set up a collective transport company to operate the lines. The Chilean part of the new line from Antofagasta to Salta, Argentina, was expected to be completed by the end of 1945, and by May was reported in operation to within 35 miles of the Argentine border. The railway is paralleled by an international highway. Postwar plans published in March 1945, called for the spending of about \$56,000,000, largely for construction, power stations, new locomotives, and equipment, in connection with electrification, especially in the south. There were 24,855 miles of highways reported for 1939, of which nearly 20,000 were fit for motor traffic. Navigable river mileage was reported as 851, and navigable lake mileage as 497. Aviation was said to be well developed internally. In February 1945, regular air service was established between Santiago, the capital, and Puerto Montt, 574 miles south. Scheduled international service is also maintained with Argentina and the United States. There were in 1940, 1,107 post offices, 488 telegraph offices, and 284 telephone exchanges. Wireless stations, including that on the Juan Fernández Islands, 400 miles southwest of Valparaíso, are operated by the navy. Before 1944 there were three large radio broadcasting stations. In that year concessions were granted for the operation of several short-wave stations, and plans approved for the setting up of a radio telegraph installation.

Agriculture and Industry.—Chile's agriculture and industry are profoundly conditioned by its geography. Chile, with the Pacific lying along its entire length, as a primary determining factor, is a narrow strip, varying from about 75 to 250 miles in width, much of its area being occupied by ranges or foothills of the Andes, which form its eastern boundary with Bolivia and Argentina. The northern part, aside from its important minerals (especially nitrate, iodine, and copper), is mainly desert. Central Chile (the Santiago region), the oldest settlement, accounts for a little over half the country's population. Southern Chile, extending some 1,450 miles, from Concepción to Cape Horn, itself falls into two sections. The northern section, as far south as Puerto Montt, has varied physical features, including many lakes, and is inhabited by upwards of 100,000 Indians, mainly around Temuco, 80,000 Germans, and later Chilean settlers. It supports nearly 40 per cent of the country's cattle, and still has large stretches of virgin land. The

southern section, from Puerto Montt to Cape Horn, with its unnumbered islands, untouched forests, glaciated mountains, and (toward the Cape) increasingly heavy winds and rains, is frontier country, containing only about one per cent of the population. Southern Chile is becoming more and more important in the country's economy. Like the North American west in pioneer times it is attracting thousands of settlers through the lure of free land. Whereas in the older parts of Chile some 90 per cent of the land was in 1942 in the hands of about 5,000 great proprietors, in the south, since 1929, the government has given free land in comparatively small holdings (based on 600 hectares) to 26,648 colonists.

Since 1939, agriculture and industry have also been affected in important ways through the program of the Development Corporation of Chile, organized under the law of April 28, 1939, with a capital of 1,000,000,000 pesos, with an additional 500,000,000 pesos for the promotion of low-cost housing. The main purpose of the corporation has been to aid Chile in achieving a more diversified economy, so that the country will not be so dependent as formerly upon its minerals.

Lack of balance in the country's general economy has been reflected in overdependence of the population upon such foods as wheat and sugar, with insufficient use of milk, eggs, vegetables, and fruits. In January 1945, an agricultural development plan was introduced by the Ministry of Agriculture calling for the expenditure of about \$466,000,000 during a period of between 10 and 19 years. In addition to large increases in production of the protective foods, the program includes extensive provisions for the improvement and marketing of crops and of livestock, increased use of modern agricultural machinery and scientific techniques, construction of many roads, bridges, and irrigation projects, and large increases in the farm population through colonization. Both the government and private business are participating in the agricultural development program, the intention being to increase and improve production and distribution of essential food and commercial crops, and by this means to raise the purchasing power, health, and living standards of the entire farm population.

Chile's principal crops are wheat, barley, oats, haricots, corn, and potatoes, fruits and wines also being important. In April 1945, the harvesting of grain, fruit, and vegetables (with the exception of potatoes) was reported close to normal. Despite anticipated loss of some rice because of rains, authorization was reported in September for exportation of an additional 10,000 tons, whereas wheat had to be imported to meet a shortage.

Livestock.—Chile had in 1942 over 2,300,000 cattle, and in 1936 about 5,800,000 sheep, 570,000 pigs, and 528,000 horses, in addition to other domestic animals. Most of the wool is used by the textile industry, which supplies 85 per cent of Chile's silk and rayon products, and which employs 22 per cent of the country's workers.

Fish.—Chile has been called the "Eden of Seafood" (John W. White and Dorothy C. Benjamin, in the *Inter-American*, September 1945), but owing to lack of refrigerated storage and distribution arrangements fish is still a luxury when it could be a staple food. Plans of the Fish Commission of the Production Development Corporation called for the completion, in 1944, of a large

whaling station and conversion plant at Quintay Cove, near Valparaíso, and in 1945 produced large increases in the value of the fish and fish products of Talcahuano, the leading fishing port (near Concepción), and stimulated an important fishing development based on Antofagasta in north Chile.

Forests.—Preliminary estimates published in February 1945 put Chile's forest area at 30,742,391 acres, nearly 16 per cent of the country's total area. Artificial forests already in use cover 102,082 acres, with an additional 316,785 acres in formation.

Minerals.—The chief wealth of the country has been in its minerals. For many years the world's entire supply of natural nitrate of soda was supplied by Chile's arid northern zone, in deposits from 4,000 to 7,500 feet above sea level. Between 1910 and the Second World War, Chile's production of natural nitrate dwindled from 64 per cent to 8 per cent of the world's supply. Chile was still producing 66 per cent of the world's iodine (a by-product of the nitrate industry), and in 1941 ranked second (to the United States) among the copper producing countries, (with a total output of 453,528 metric tons), a position which was maintained for the first nine months of 1944. The Development Corporation, in its mining program, has stressed metallurgical research and increased production, not only of copper, but of zinc, gold, lead, manganese, sulphur, fertilizers, fuels (coal and oil), iron and steel. In 1944 lack of transportation facilities kept the total output of iron ore down to 17,670 metric tons, as compared with a normal output of 1,500,000 tons, but preliminary estimates for the coal output were placed at 2,275,719 metric tons, which would make it the highest for 20 years. Production for the first quarter of 1945 showed a decrease said to be due to lack of ships. Plans were under way during 1945 for the construction of a new steel plant on San Vicente Bay, near Concepción, at an estimated cost of \$48,000,000, and for the scientific investigation of petroleum indications found in April near Punta Arenas, on the Strait of Magallanes (Magellan).

Manufacturing.—Extensive plans have been made for modernizing and expanding industries under the basic categories of: iron and steel, fuel and energy producers, transportation (land, sea, and air), agriculture (machinery for use on the farms, in the forests, and on the sea), food processing, construction (for production of cement and other materials), and miscellaneous industries covering a wide range.

During the first half of 1945 domestic manufactures (apart from many essential food products) showed general increases. Government inducements were being offered to farmers to produce greater quantities of agricultural goods, and further expansion in many industries was awaiting provision of the necessary machinery. In September, for example, construction work on the Pan American Highway was being hampered through delay in deliveries of modern equipment from the United States, and plans were under consideration for importing prefabricated houses to meet the continuing shortage in that field.

Construction.—During 1945, the Development Corporation planned extensive construction projects intended to promote expansion in agriculture, industry, and business. The list of projects (in addition to those for extending and modernizing transportation facilities) includes dams and canals for improving irrigation, sawmills and other wood-

processing plants, and chemical, refrigeration, and hydro-electric plants. These constructions were planned as part of a huge program calling for eventual expenditure of about 8,000,000,000 pesos for the construction of factories and office buildings, houses (of which 300,000 were estimated to be needed), and government buildings. Immediate plans for the building of 2,551 houses in 26 cities and towns, at an estimated cost of 130,000,000 pesos, were announced by the Popular Housing Institute, 24,000,000 pesos being allotted to the Retirement and Social Provision Institute of the State Railways, to be spent during 1945 on housing for railway workers and their families. The Caja Nacional de Empleados Públicos y Periodistas, an organization concerned with promoting social security for public employees and journalists, also laid plans for the construction of houses and office buildings valued at some \$9,484,000 during a five-year period. Two cement plants, planned to supply most of the country's requirements, were expected to have increased their total monthly output to 20,000 tons by October 1945.

Finances.—In the national budget for 1945 as passed by Congress on Dec. 30, 1944, revenues and expenditures balanced at 4,749,000,000 pesos (equivalent to \$153,200,000 in United States currency, in which 31 pesos = one dollar). The final budget for 1944 balanced at approximately 3,788,000,000 pesos. The large increase in expenditures for 1945 was accounted for by the inclusion of items formerly listed as "extraordinary", the most important increases being amounts granted to raise the salaries of state school teachers, and nearly 300,000,000 pesos to the Public Works Ministry. Increased revenues to meet these amounts were expected from the "extraordinary" tax on copper; a sharp rise in the surcharge on Chilean customs duties; payment by importers (of all but five essential commodities) of taxes at the rate of 31 pesos to the dollar instead of at the former special rate of 19.37 pesos to the dollar; increased property valuations; and a proposed lowering of exemptions on personal income surtaxes.

In April (1945), the government, as a countermeasure to the rising threat of inflation, sought authorization for wide control over prices, salaries, rents, and transportation charges, and over the distribution of raw materials and of all articles likely to be scarce because of the war. In August large issues of government bonds, for sale to the Central Bank and other financial agencies, were authorized to provide for the administration's agricultural, public works, and transportation projects.

Trade.—According to a report in the *Foreign Commerce Weekly* of April 14, 1945, Chilean trade, both domestic and foreign, like Chilean agriculture and industry, must be considered in relation to the general effort being made to broaden and stabilize the country's economy.

In July 1945, the minister of economy and Commerce was asked to formulate and apply a plan for making Chile more self-sufficient, and achieving a favorable international trade balance. The minister was given power to unify the government's various economic agencies, to exercise continued control over foreign trade and exchange, and over prices within the country, and to streamline Chile's domestic commerce in the interests of both producers and consumers.

At the end of July, Chile concluded a trade agreement with the United States granting the latter country tariff reductions for one year on

many manufactured articles, including drugs and chemicals, iron and steel products, paper, clothing, and textiles. On Sept. 12, 1945, it was granted a loan of \$20,000,000 from the Export-Import Bank (in Washington) to finance the construction of a steel mill.

In 1944 Chile's exports amounted to 944,000,000 gold pesos, its imports to 698,700,000 gold pesos; the export figures representing gains of 8.9 per cent and 9.4 per cent over those for 1943 and 1942 respectively, and the import figures representing gains of 9.8 and 12.4 per cent over those for 1943 and 1942.

Principal Events.—Apart from the efforts made to strengthen its national economy (see foregoing sections), Chile also played its part in international affairs during 1945. On Dec. 11, 1944, Chile had become the sixth country in Latin America to recognize the Soviet Union. On Feb. 14, 1945, its representative in Washington (along with representatives of Peru, Paraguay, and Ecuador) signed the Declaration of the United Nations, and it was announced that Chile had declared a state of belligerency with Japan, the Chilean Senate voting a formal declaration of war on April 11. In January 1945, Chile participated in the inter-American business conference at Rye, New York, where the Chilean representatives, concerned for the future of two of Chile's leading industries—copper and nitrate—declared in favor of internationally supervised agreements for restricted marketing. In February and March Chile took part in the Inter-American Conference on Problems of War and Peace, in Mexico City (see PAN AMERICAN AFFAIRS), and was among the 46 nations originally represented at the San Francisco Conference (April-May 1945). The Chamber of Deputies ratified the United Nations Charter on September 17. On the following day the Chilean ambassador to Argentina delivered a sharp public rebuke to Vice President Juan Perón of Argentina, aimed at his dictatorial policy. In the meantime, Chile's general elections, held on March 4, had resulted in gains for the Conservatives, Liberals, Independents, and Agrarians, giving them a majority of one in the Senate, although the government coalition parties still claimed a majority in the Chamber of Deputies. The election results were expected to be reflected in Cabinet changes. The Chilean Cabinet resigned on September 20, permitting President Juan Antonio Ríos to appoint a new government before his intended absence from the country. President Juan Antonio Ríos visited the United States in October 1945, spending several days in Washington and later going to New York for a week.

Two earthquakes were reported in the Santiago area during the year, one on January 17, the second on September 13, extending over 200 miles and causing some loss of life and much damage to property. On June 19, a fire at the mine of the Braden Copper Company at Sewell resulted in the death of 350 people.

CHINA. The outstanding event of the year 1945 in China was the victorious conclusion of the nation's eight-year War of Resistance against Japanese aggression, which began with the Lu-kouchiao incident on July 7, 1937. It marked the end of the long night of enemy invasion and occupation, of fighting against unequal odds, of living under the staggering burdens of a war that had gone into its ninth year. For China the first eight months of 1945 were not unlike those of the preceding war years—except that in the end victory came.

Military Operations.—*Burma-Yunnan.*—The battle for China's lifeline ended in victory when the Chinese Expeditionary Force clearing the enemy from North Burma joined hands with Chinese troops pushing down from West Yunnan. The two forces met at Mu-se on January 21; seven days later the first convoy in almost three years rolled into China over the Ledo-Burma Road, renamed the Stilwell Road by President Chiang Kai-shek. The Chinese forces pushed southward to recapture Lashio, March 7, and Hsipaw, March 18, concluding the Chinese Army's mission in Burma. Chinese casualties in the Burma-Yunnan campaigns totaled more than 80,000, of which 30,000 were killed. *Honan-Hupeh:* The enemy started a campaign west of the Peiping-Hankow Railway on March 21, directed at Laohokow and Nanyang, in western Hupeh and western Honan, respectively. Starting with 80,000 men, the enemy moved rapidly, capturing Laohokow on April 11. The next day the Chinese recaptured the city and counterattacked; by April 22 the front had reverted to its original position. In western Honan, the Japanese went beyond Nanyang and reached Hsihsiakow in early April, where later they were stopped in their drive westward. *Hunan:* The enemy launched a major offensive, employing 100,000 men, on April 9, directed at the important airbase city of Chihkiang. The drive was smashed on May 10. Chinese forces won all lost points and by the end of June were fighting outside Paoking, major enemy base. Military observers described the Chihkiang victory as "a turning point."

The main drives of the Chinese general counteroffensive were launched along the "invasion coast" of Fukien and Chekiang and in the southwestern provinces of Kweichow and Kwangsi, where toward the end of 1944 China's armies had turned back a dangerous enemy thrust at Kweichow, threatening Chungking, the wartime capital. *Fukien-Chekiang:* Pushing up the coast, Chinese forces recaptured Foochow, first major port city to be liberated, on May 18, and Wenchow, Chekiang port, on June 18. By the middle of July they had driven to within 50 miles of the nation's capital, Nanking. *Kweichow-Kwangsi:* The Chinese followed up their success by cutting the enemy north-south corridor, capturing Hochih, May 20, and Nanning, May 27. Climaxing the series of drives was the recapture of Liuchow, June 29, and Kweilin, July 27. The winning of these two key Kwangsi cities marked the last important fighting in the China theater shortly before Japan's surrender.

On August 21, Japanese surrender envoys arrived at Chihkiang, western Hunan, for instructions on the surrender of all Japanese forces in China, (except Manchuria) Formosa, and Indo-China, north of 16° north latitude. Chinese armies began to move in to reoccupy important points in the former enemy-occupied areas; the first Chinese and American airborne units landed at Nanking and Shanghai, August 27. Japan's official surrender of her 1,090,000 troops in the China theater took place on Sept. 9, 1945, at Nanking, seven days following the ceremony on board the U.S.S. *Missouri*.

The cost of victory in Chinese military casualties alone in the eight years of war totaled more than 3,500,000, of which 1,800,000 were killed and 1,700,000 wounded and missing. The success of Chinese arms in the closing stages of the war was largely due to the drastic reorganization of the army, aimed at the improvement of its fighting quality. Instead of trying to maintain a

huge army of 5,700,000 men, it was decided to dismiss one third of the personnel and abolish superfluous organizations. By April, altogether 1,410 military units had been dissolved and 1,100,000 men taken off the army payroll; the numerical strength of the army was expected to be further reduced to 3,500,000 by the end of 1945. An important contribution to the successes in China was the close Chinese-American teamwork not only in the field but in large-scale training of the Chinese Army conducted with the aid of the United States Army in China.

Economic Affairs.—The economic situation was not immediately improved with the opening of the Stilwell Road. In the last three years of virtual blockade, economic and financial difficulties had mounted, especially the rapid deterioration of wartime living, caused by warborn inflation, and a general breakdown of transportation.

China's retail price index for May 1945 was 1,435 times the basic figure of June 1937, a month before the outbreak of war. The price of rice in June 1937 was Ch\$11 per *shih tan* (175 lbs.); in July 1945, the same amount cost Ch\$12,000. The 1945 budget was about 190 times larger than that of the fiscal year preceding the start of the war. The enormous cost of the war was borne by taxation and savings. The adoption of the policy of selling gold to withdraw the redundant purchasing power of the public resulted in the withdrawal of 80 billion dollars of *fapi* (legal tender) by June.

On January 23 the Executive Yuan (Council) adopted a series of proposals on tax and administrative reforms, specifying the abolition of taxes on certain products which yielded little revenue but caused much hardship to the people; the suspension of state monopolies on salt, tobacco and matches, which had been burdensome to the people; and the scrapping of overlapping organizations. A total of 509 offices under the Finance Ministry, with a staff of 17,996 persons, were either abolished or amalgamated, saving the government around Ch\$1,614,000,000 in 1945.

The Chinese War Production Board which had been set up with the aid of American industrial experts reported that the production of iron in May, 1945, was 46 per cent higher than the preceding November and 50 per cent higher than the average monthly production of 1944; the production of steel in May was 52 per cent higher than last November and 68 per cent higher than the average monthly production of 1944; and alcohol production in May was 2.7 times as high as the same month in 1944.

The problem of wartime transportation—in June 1945, Free China had a total of only 872 miles of railways and less than one tenth of the prewar number of rolling stock and cars—was tackled by a co-ordinating agency, the War Transport Board, set up on New Year's Day. Another Chinese-American effort, the board's first big job was the management of the newly opened Stilwell Road although its supervisory functions also extended over rail, air, and waterways.

Political Developments.—The two basic issues of unity and democracy continued to dominate the Chinese political scene. At war's end, prospects for settlement of these two important issues were bright. The government followed its declared policy of seeking a political solution to the Chinese Communist problem. Negotiations which began in June 1944 and proved fruitless were resumed in the winter of 1944-45. Reporting on the second phase of the talks, President

Chiang, in an address on March 1 before the opening meeting of the Preparatory Commission for Inauguration of Constitutional Government, declared that the government had met the issues raised by the Communists with concrete proposals but these were rejected. Friction between the government and Communists resulted in a clash in Shensi in July. More trouble arose during the period of Japan's surrender.

On August 14, President Chiang invited Mao Tse-tung, leader of the Chinese Communist Party, to Chungking to confer on national problems. Five days later, he again urged the latter to come. On August 26, the day that Moscow made public the terms of the new Chinese-Russian Treaty, the Communist leader accepted after a third invitation. On August 28, Mao, escorted by United States Ambassador Hurley, arrived to begin talks with government leaders on national unity and reconstruction, which observers believed had a good chance of success.

Progress toward political democracy and constitutionalism received new impetus from the government's decision to terminate the period of political tutelage and inaugurate constitutional government. In his New Year message, President Chiang declared that the National Assembly would be convened before the end of the war to adopt and promulgate a constitution; on March 1, he reiterated his promise and set November 12 as the date for the calling of the assembly, subject to the approval of the Kuomintang Congress. The Sixth Kuomintang National Congress, convening on May 5, approved the November 12 date. At the inaugural meeting, President Chiang, who was re-elected director general of the party, again declared that the inauguration of constitutionalism should not be delayed. Before the Congress ended on May 21, it had outlined a revised program and policy for the Kuomintang and endorsed the government policy of solving the Communist problem through political means. On June 13, the government announced three measures calling for abolition of Kuomintang branches in the army and in educational institutions and popular election of district and provincial people's political councils.

The Fourth People's Political Council on July 19 agreed to leave the date for the convocation of the National Assembly to the government's discretion. It also urged the widest representation in the assembly and that, prior to its meeting, the government should continue to work for unity through political means, insure freedom of speech, recognize the legal status of political parties and complete the setting up of people's representative organs in all Free China provinces.

Important Changes in the Government: Generalissimo Chiang and Dr. H. H. Kung resigned from respective posts as president and vice president of the Executive Yuan. Dr. T. V. Soong and Dr. Wong Wen-hao, appointed successors, respectively. Dr. Wang Shih-chieh, minister of information, was named minister of foreign affairs, a post that had been concurrently held by Dr. Soong. Dr. K. C. Wu, political vice minister of foreign affairs, was appointed minister of information; Dr. Hollington K. Tong, vice minister of information, resigned. Kan Nai-kuang was named political vice minister of foreign affairs, and Liu Chieh, administrative vice minister of foreign affairs.

Foreign Relations.—China, as one of the sponsoring powers, played an important role at the United Nations Conference on International Organization at San Francisco. The United States,

the Soviet Union and the United Kingdom agreed to support China's three proposals put forth at Dumbarton Oaks in 1944. At the first plenary session, Dr. T. V. Soong, chairman of the Chinese delegation, gave China's message to the conference in these words: "We must not hesitate to delegate a part of our sovereignty to the new international organization in the interests of collective security." On May 18, Dr. V. K. Wellington Koo, one of China's ten delegates, said the Chinese delegation was guided by two motives: (1) to contribute China's part in setting up a machinery through which peace and security may be maintained, and (2), to co-operate with the other United Nations in promoting the welfare of all people and in establishing the rule of law in international conduct. Before UNCIO closed, China and Brazil jointly proposed the establishment of an international health organization, which received unanimous support.

On July 31 the Supreme National Defense Council approved China's adherence to the United Nations Charter and the Bretton Woods Agreement. On August 25 the charter, which had been approved by the Legislative Yuan ten days earlier, was signed by President Chiang Kai-shek.

China and the Soviet Union signed a thirty-year Treaty of Friendship and Alliance and a series of supplementary agreements in Moscow on August 14, the day Japan surrendered. The result of talks Premier T. V. Soong held with Generalissimo Stalin on two separate visits to Moscow in June-July and August, conclusion of the treaty and its related agreements was regarded by many high Chinese officials as laying a cornerstone for peace in Asia and the world. On August 26 Moscow made public the terms of the new agreements, which were ratified by both governments on August 24.

Main points of the treaty and the supplementary agreements: (1) mutual military assistance against future Japanese aggression; (2) Russia to render China moral support and military assistance to be exclusively given to the National Government as the central government of China; (3) Russia to respect China's full sovereignty over the Three Eastern Provinces (Manchuria) and to withdraw from those provinces within three months after Japan's formal surrender; (4) joint ownership and administration of the Chinese Changchun Railway (the Chinese Eastern Railway and the South Manchurian Railway combined); (5) Port Arthur to be a joint Chinese-Soviet naval base and Dairen a free port, both under Chinese administration; (6) China to recognize the independence of Outer Mongolia if its people so desires under a plebiscite; and (7) Russia to avoid interference in internal affairs of Sinkiang.

An important statement on China's foreign policy was made by President Chiang on August 24 before a joint session of the Supreme National Defense Council and the Kuomintang Central Executive Committee. He declared that China's policy based on Dr. Sun Yat-sen's Principle of Nationalism sought, externally, China's national independence and freedom and, internally, equality for all racial groups. Main points of his address were: China had regained her sovereign rights in the Northeastern Provinces, Formosa, and the Pescadores; Korea would be restored her independence and freedom; independence of Outer Mongolia should be recognized through legal procedure and Tibet be granted a high degree of autonomy; China hoped to resume

normal and friendly relations with Burma, Thailand (Siam) and Indo-China; and changes in the status of Hongkong would be introduced only through friendly negotiations.

Sweden signed a new treaty with China on April 30, relinquishing all extraterritorial and related rights in China. On June 8 China and the Dominican Republic concluded an agreement providing for unrestricted travel of nationals of both countries in the territory of each other. France agreed to the return to China of the leased territory of Kwangchow, under a new Chinese-French convention signed on August 18, renouncing all rights in China's favor.

DAVID LEONG,
Managing Editor, China at War, Chinese News Service, New York.

CHIROPRACTIC. The science of chiropractic is based on the theory that disease results from a lack of normal nerve function. The efforts of the chiropractic physician are directed toward the restoration of the normal functioning of the nerve system, largely through articular adjustment and manipulation of the spinal column. Supplementary measures, such as light, heat, air, water, diet and exercise, are used when indicated. Since 1895 more than 30 million people have availed themselves of the health services offered by some 20,000 doctors of chiropractic throughout America.

Extending whole-hearted co-operation to the federal government in the prosecution of the Second World War, the National Chiropractic Association continued to render free chiropractic health service to all men and women wearing the uniform of the armed forces.

Nearly one thousand chiropractors now serving in the armed forces have been granted honorary membership in the American Society of Military Chiropractors, in recognition of their professional services to their country. A service publication, *The Chiron Call*, was distributed monthly during the war period to all chiroprans in the armed forces through the courtesy of the National Chiropractic Association.

Recognizing the imperative needs of postwar planning for returning chiropractic veterans, the National Chiropractic Association designated Sept. 18, 1945, as Chiropractic Veterans Rehabilitation Day, and urged its thousands of members to set aside their gross earnings for the Chiropractic Veterans Rehabilitation Fund, which will be used exclusively for the purpose of providing "refresher" courses for returning chiropractic veterans and re-establishing them in the private practice of their profession in civilian life.

The National Chiropractic Association created a new organization, the Chiropractic Research Foundation, Inc., which was organized exclusively for charitable, scientific and educational purposes. Incorporation papers for this \$1,000,000 humanitarian project were filed during the convention in July, 1944, setting forth the objects and purposes of the foundation.

During the first half of the year, nearly \$250,000.00 was voluntarily pledged to the Chiropractic Research Foundation, Inc., by leading chiropractors throughout America. Thus, it seems assured that the initial goal of \$1,000,000 will be reached before the Golden Jubilee convention which will be held in Toronto in July 1946. It is then planned to embark on a promotional campaign among the public—especially the millions of chiropractic beneficiaries—to raise \$25,000,000 during the next five years. The funds raised will be placed in trust to be used exclusively for the

Tin mines. Tailings from the dressing table still contain a small percentage of tin (about .7 per cent) which is removed by workmen from the waste of the plant. Only a small percentage of tin is recovered in this manner.

purposes of scientific research, college endowment, chiropractic education and hospital advancement.

The general convention for 1945 was cancelled at the urgent request of the Office of Defense Transportation, and a meeting of the executive board of directors and executive officers was held in Chicago, Ill., in July.

The Canadian Memorial Chiropractic College, teaching a scientific course of four collegiate years, was established in Toronto, Ontario, during the year, as scheduled. The first enrolment date for students was in September 1945, and nearly 100 applications for enrolment had been accepted on the opening date.

Extensive plans are under way for the enrolment of returning veterans in chiropractic colleges throughout the country since a marked interest has been indicated by many service men and women in choosing chiropractic as a postwar professional career. It has been determined that the accredited chiropractic colleges teaching a minimum professional course of four collegiate years of not less than 3,600 hours will be the choice of most returning veterans since this will simplify their recognition before the state boards of chiropractic examiners in the various states.

As of September 1945, 43 states have granted legal recognition to chiropractic practitioners—all but Louisiana, Massachusetts, Mississippi, Texas and New York. The practice is also legally regulated on a four-year basis in the District of Columbia, Alaska, and Hawaii; British Columbia, Alberta, Ontario and Saskatchewan, in Canada, and several foreign countries.

CHRISTIAN SCIENCE. The religion founded by Mary Baker Eddy and represented by the Church of Christ, Scientist. During the year 1945, The First Church of Christ, Scientist, in Boston, Mass., and its branches located throughout the United States, co-operated through the Christian Science War Relief Committee with other war relief groups. Christian Science war relief clothing was made available to sufferers regardless of their religion. During the first six months of 1945 the total number of garments sent by this committee to Continental Europe amounted to 970,000. This did not include the vast number of knitted garments that were sent to men and women in the armed forces of the United States. With the end of the war in Europe, a Christian Science Postwar Relief Committee was formed.

Through another committee, the Christian Science Camp Welfare Committee, the Christian Science church maintained Christian Science wartime ministers and volunteer workers who ministered without charge to the spiritual and material needs of men and women in the armed forces of the United States and its territories, as well as Canada and some overseas countries. Nearly 600 such workers were under the supervision of this committee.

During 1945 there were 25 Christian Science chaplains in the army and one in the navy. Four of these chaplains received bronze stars for meritorious service, and three members of the unit in which one chaplain was serving received presidential citations.

The literature published by The Christian Science Publishing Society, which includes *The*

Christian Science Journal, a monthly publication listing churches, societies, and accredited practitioners, was available at all Reading Rooms maintained by the churches, as well as at all rest rooms and recreational centers provided by The Mother Church for servicemen and women.

In radio, transcribed programs prepared in The Mother Church were broadcast over more than one hundred stations throughout the United States and Canada. The Mother Church also continued its periodic broadcasts on Sunday *Columbia Church of the Air* programs over the Columbia Broadcasting System.

The Christian Science Monitor, an international daily newspaper, published by The Christian Science Publishing Society, maintained its usual large staff of correspondents throughout the world, including war correspondents in all theaters. The *Monitor* received a fire-prevention award of a \$500 gold medal for outstanding service in the field of fire-prevention. It also received the Helms Athletic Foundation award in recognition of noteworthy achievement in the realm of sports. It won first honorable mention in the over-50,000 circulation group, in the annual exhibition of newspaper typography conducted by N. W. Ayer and Son, Inc.

WILLIAM D. KILPATRICK,
Manager, Committees on Publication, The First Church of Christ, Scientist, Boston, Mass.

CHRISTMAS ISLAND. Name of two islands under British sovereignty. (1) The largest atoll in the Pacific Ocean, more than 100 miles in circumference, 164 miles southeast of Fanning Island, and likewise within the Gilbert and Ellice Islands Colony (see WESTERN PACIFIC ISLANDS, BRITISH). Christmas Island has an area of 94 square miles, and the population in 1937 numbered 47, of whom five were whites. At the main settlement is an anchorage safe for vessels in calm weather. The Central Pacific Coconut Plantations, Limited, has leased the island for a term of 87 years from Jan. 1, 1914, having the exclusive right to plant coconuts (1,200 acres under cultivation), manufacture copra, and export coconut oil, pearl shell, and guano. The island was discovered by Capt. James Cook in 1777, annexed by Great Britain in 1888, and included in the colony in November, 1919. (2) An island in the Indian Ocean, 190 miles south of Java, administratively within the Singapore Settlement of the Straits Settlements (see BRITISH MALAYA). The area is 60 square miles, and the population in 1941 was 1,431. It was annexed in 1888, and in 1891, 6,000 acres were leased for coconut planting. The rich phosphate deposits subsequently gave the island considerable economic importance; 238,006 tons of phosphate of lime were exported in 1940. Japanese forces occupied Christmas Island on April 10, 1942.

CHRONOLOGY FOR 1945. See under UNITED STATES; WORLD WAR, SECOND.

CHURCHILL, Winston Leonard Spencer, British statesman and man of letters: b. Blenheim Palace, Oxfordshire, Nov. 30, 1874. He is the son of Lord Randolph Henry Spencer Churchill and Jeannette (born in Rochester, N.Y., in 1854), daughter of Leonard Jerome, proprietor of the *New York Times* and a banker. His love of soldiering as a young man, and the sound strategical concepts which he displayed in later years, traits which he has in common with his great ancestor John Churchill, the first duke of Marlborough. A man of many parts, and with great zest

for life, he possesses considerable skill as a landscape painter. In his youth he was an ardent polo player, and in middle life he learned to pilot an airplane, and took out a union card as a qualified bricklayer. The courage which he showed in so many fields reached its heights in his long career in politics. His mastery in debate, his brilliance as an orator, his independence, rank him among the outstanding parliamentarians of his day—indeed, among the greatest figures in British history. In his speeches, so carefully prepared and rehearsed, and in his forceful and lucid writings, he exhibits a knowledge of the English language that has seldom been equalled.

After attending Harrow School, where he coupled a conspicuous distaste for Latin with an early enthusiasm for his own language, he secured entry to Sandhurst Military Academy (the British "West Point") at the third attempt, and on being commissioned in 1895 he was gazetted to the 4th Hussars. The same year, while on leave, he visited Cuba as an observer in the Spanish campaign against the guerrillas, and in 1896 he obtained a transfer to the Indian Army. Here he polished his education by studying philosophy, history, and economics, and during 1897, as an officer in the 31st Punjab Infantry, he served on the Northwest frontier in the Malakand and Tirah operations. On these campaigns he was war correspondent for the Allahabad *Pioneer* and the London *Daily Telegraph*, and from the experience came the first of his numerous books, *The Story of the Malakand Field Force* (1898), a best seller in which he dared to criticize his superior officers. *Savrola*, his undistinguished and only attempt at fiction, was shortly published serially by *Macmillan's Magazine*, and appeared in book form in 1900. Sir Herbert (later Lord) Kitchener accepted him with reluctance in 1898 for service in the Egyptian campaign for reconquest of the Sudan; riding with the 21st Lancers in the battle for Omdurman, he participated in one of history's last classic cavalry charges. He reported the campaign for the London *Morning Post*, and later recorded it in *The River War* (1899), another highly critical, though accurate, work. Deciding to abandon army life for politics, in 1899 he contested the Oldham parliamentary division as a Conservative; and after failing to win the seat, he sailed for Capetown to report the South African War for the *Morning Post* at the highest salary yet paid to a war correspondent. When an armored train in which he was riding in November 1899, two weeks after arrival, was ambushed by the Boers in Natal, he helped in the defense; he was taken prisoner, however, his captor being Louis Botha, later, and largely with the support of Churchill, the first premier of the Union of South Africa. Because of Boer clemency he was not shot for exceeding the functions of a journalist, but was imprisoned at Pretoria, whence he escaped within a month with a price on his head. Making his way across Portuguese East Africa, he reached Durban, in Natal, where he was commissioned lieutenant in the South African Light Horse; he saw a good deal of the subsequent fighting up to the capture of Pretoria, where he helped release his erstwhile fellow prisoners. He gave an account of his experiences in *London to Ladysmith via Pretoria* (1900) and *Ian Hamilton's March* (1900).

Back in England before the end of 1900, he stood once again as parliamentary candidate at Oldham, on this occasion successfully. Soon, in the House of Commons, he began to assail the policies of the Conservative government under

whose banner he was supposed to be serving, opposing increases in the army and urging leniency in the treatment to be meted out to the Boers. The tariff reform proposals of Joseph Chamberlain in 1903 met with his uncompromising opposition, and over this issue he left his party in the summer of 1904. At the early age of 31 he obtained his first ministerial post, the minor one of under secretary of state for the colonies, in the Liberal administration formed in 1905 by Sir Henry Campbell-Bannerman. At the ensuing general election he was returned to Parliament by the voters of the Northwest Manchester division, and with his chief, the 9th Earl of Elgin seated in the Lords, he became the spokesman for his party in the Commons. His ability in piloting legislation to transform the Transvaal and Orange Free State into British colonies presaged the brilliant future that lay ahead. The year 1906 saw publication of his *Life of Lord Randolph Churchill*, an authoritative two-volume biography by an admiring son; and in *My African Journey* (1908) he recorded a tour through East Africa from Mombasa to the Sudan by way of Uganda.

In 1908, now 33 years old, he became president of the Board of Trade in the Cabinet reconstructed by Herbert Asquith; in that year, too, he married Clementine Ogilvy Hozier (who was to bear him a son and four daughters), "and," as he later confessed, "lived happily ever afterwards." Repudiated at Northwest Manchester, he was re-elected by the voters of Dundee, and now he showed his interest in social legislation by introducing labor exchanges and helping to create unemployment insurance. For his support of the budget of David Lloyd George imposing much additional taxation, he was denounced as a traitor to the wealthy class to which he belonged. Transferred to the Cabinet post of home secretary in 1910, he reduced or cancelled numerous prison sentences and in several ways sought to ameliorate the rigors of imprisonment. Attacks were made upon him in Parliament and the press for his part in the "battle of Sidney Street," a siege of foreign criminals in a London slum on Jan. 3, 1911. Before he left the Home Office, he secured passage of bills setting up a minimum wage in certain sweated industries, limiting hours of work in shops, and protecting coal miners.

Disagreement between army and navy heads as to the strategy to be adopted in the event of war, and the aspirations of Kaiser Wilhelm II for "a place in the sun," clearly indicated in 1911 the need for a strong man at the Admiralty. Churchill was the obvious choice for First Lord, and as soon as he assumed his duties he planned a great increase in naval strength; before long, too, he created the navy's first air service. In July 1914, acting entirely on his own responsibility, he forbade dispersal of the fleet after a royal review off Spithead, with the result that, when hostilities commenced two weeks later, the British Navy was already fully mobilized. He personally accompanied a British naval landing force to Antwerp the following October, and though it failed to defend the city, the German advance was slowed and the Channel ports thus saved. The Dardanelles campaign of 1915, for which Churchill had pressed, proved a blunder through the inadequacy of others, precipitating a public quarrel with Admiral Lord (John Arbuthnot) Fisher and resulting in a Cabinet crisis. With formation of a Coalition government he was ousted from the Admiralty, and in November 1915, after a short tenure of the minor Cabinet post of chancellor of the duchy of Lancaster, he resigned.

Forthwith he went to the Western Front as a major in the second Grenadier Guards, and with the rank of lieutenant colonel he was given command of the 6th Royal Scots Fusiliers in the trenches of northern France. He resumed his seat in the House of Commons in the autumn of 1916, and the next year he succeeded Lloyd George, now prime minister, as minister of munitions. In 1915, while at the Admiralty, he was one of the first to encourage development of what became known as the tank, and now he put an improved model into large-scale production; German Gen. Erich von Ludendorff is authority for the statement that in no small measure the tank decided the later course of the war.

In the reorganized Coalition Cabinet of 1919 he was made secretary for war and air minister, and soon was widely denounced for bolstering up the White Russians in their futile struggles against the Bolsheviks. Appointed colonial secretary in 1921, his main preoccupation was with the many problems of the Middle East; long a supporter of home rule for Ireland, he also participated in the negotiations resulting in establishment of the Irish Free State. He went into temporary retirement when repudiated by the Dundee electors in the 1922 general election, for the first time since 1900 being without a seat in Parliament. During this period he turned once more to writing, preparing the first installments of *The World Crisis* (1923-29), a colorful five-volume record of the First World War in which he strongly denounced the costly strategy employed on the Western Front.

When Churchill again entered the political arena, in 1924, he offered himself as an independent anti-Socialist, attacking the Labor Party which had by now supplanted the Liberals as senior opposition to the Conservative government. Unsuccessful in the Westminster Abbey parliamentary division, he secured election at Epping, once more as a Conservative after an absence from the party of nearly 20 years. Appointed chancellor of the exchequer in the Cabinet of Stanley Baldwin, he presented to Parliament five successive annual budgets; in the first, he returned Britain to the gold standard, a step which proved ultimately disastrous and precipitated the General Strike of 1926.

Advent of the Labor Party to office in 1929 left him once more without a ministerial post, though still with a seat in the House. He made a lecture tour in the United States in 1930, traveled much in Europe, and again took up his pen. In rapid succession he published *My Early Life* (1930; New York ed., *A Roving Commission*, 1941), a lightly written autobiography; *The Eastern Front* (1931), a supplement to *The World Crisis*; and *Thoughts and Adventures* (1932), a pleasant miscellany. These were followed by the four-volume *Life of Marlborough* (1933-38), a powerful vindication of his hero; the well-informed *Great Contemporaries* (1937); *Arms and the Covenant* (1938), a volume of speeches; and *Step by Step* (1939), a collection of his newspaper articles.

As early as 1932 he was warning his countrymen against the resurgent German might, but his voice, raised repeatedly in succeeding years, was unheeded by a Britain trusting that appeasement would mollify Adolf Hitler. Averse, however, to changes in British constitutional affairs, from his seat in the House he fought the Government of India bill of 1935 giving a more liberal measure of self-government to that country; in 1936 he was the one man of public fame to defend Ed-

ward VIII when confronted with the choice between a wife of his own choosing and the Crown; and in 1937 he assailed the release of the British naval ports in southern Ireland to Eamon de Valera. Although these denunciations of Conservative policies effectively debarred him from a Cabinet post, he was not to be intimidated—and in some matters time was to bring its justification.

With Britain and France humbled by German annexation of Austria and the partition of Czechoslovakia, public opinion rallied behind Churchill, and when war was declared on Germany, Sept. 3, 1939, he was the country's instinctive choice for first lord of the admiralty. Resuming the post he had been occupying when the First World War broke out a quarter of a century earlier, he inspired the nation with such confidence that, on April 4, 1940, he was given supreme administrative command of all naval, military, and air forces. On May 11, as German troops poured into the Lowlands, he succeeded Neville Chamberlain as prime minister and assumed the added post of minister of defense. "I have nothing to offer but blood, toil, tears, and sweat," he told the House of Commons, "... You ask, what is our policy—I will say: It is to wage war by sea, land, and air, with all our might and with all the strength that God can give us. . . . You ask, what is our aim—I can answer in one word—victory."

The career of Churchill in the war years that followed epitomizes the history of Britain. In 1940, while stirring the nation to immense efforts to avert invasion, with the assent of his Cabinet he took the momentous decision to send to Egypt Britain's sole remaining armored division—so that the highway to Asia might be preserved. With German submarines sinking much British shipping, in 1941 he procured from the United States 50 over-age destroyers in exchange for leased bases in the West Indies. When demands for a second front in western Europe became insistent in 1942, on a visit to Moscow he convinced the Russians that such a course, if taken prematurely, might end in a disaster which would delay German defeat for many years. None gave more enthusiastic support than he to the Allied plans for landing in North Africa in 1942 and in Normandy 18 months later.

In loyalty to Britain's allies he was unwavering. With France defeated and about to seek an armistice with Germany, he appealed to her to hold fast, even suggesting an amalgamation of the two states, with a common citizenship and joint organs of government, by means of a solemn act of union. Nor did he lose hope for her: "Never will I believe that the soul of France is dead. Never will I believe that her place among the greatest nations of the world has been lost forever." Such faith was demonstrated in the continued support he gave to General de Gaulle, unchanged even when the British Navy sank French warships anchored at Oran: "I leave the judgment of our action, with confidence, to Parliament. I leave it to the nation, and I leave it to the United States. I leave it to the world and history." Despite this friendship, however, in May 1945 he sent to de Gaulle a request, which had all the aspects of a peremptory order, to cease fighting the young Levantine republics.

For 20 years an avowed enemy of the Soviet Union, he forgot old animosities when the Germans invaded Russia in 1941: "Any man or State who fights on against Nazidom will have our aid. Any man or State who marches with Hitler is our foe." Twice Churchill flew to Moscow to meet

Marshal Stalin, and with President Franklin D. Roosevelt he conferred with Mr. Stalin at Teheran and at Yalta; and Churchill was responsible for the ratification in 1942 of a 20-year treaty of friendship between Russia and Great Britain. He was on terms of close friendship with President Roosevelt from the time they met off the Newfoundland coast to draft the Atlantic Charter. At Washington, in December 1941, they set up a Combined Chiefs of Staff organization for joint direction of the war; and before a joint session of Congress, Churchill avowed his "hope and faith, sure and inviolate, that in the days to come the British and American peoples will, for their own safety and the good of all, walk together side by side in majesty, in justice, and in peace." He visited the United States again the following June, and in 1943 and 1944 following conferences at Quebec; he met President Roosevelt in North Africa at the close of 1942, and a year later, at Cairo, the two leaders conferred with Chiang Kai-shek and President İnönü of Turkey.

Despite the fact that, as premier, Winston Churchill traveled 150,000 miles by air to visit the fighting fronts, and to confer with Allies and neutral nations, he never lost contact with domestic affairs. While departmental matters were handled by members of his Coalition Cabinet, leaders in which were of the Labor and Liberal opposition parties, he guided much of the post-war planning. In March 1943 he put forward a four-year plan for reconstruction after conclusion of hostilities, and the next year he sponsored numerous proposals for domestic reform: an enlarged social insurance plan, extending that which he, as a Liberal, had introduced 30 years earlier; health services which were to be freely available to everybody; and a partnership of the state with private enterprise to restore the export industries without which Britain could not survive. Although his constant, insistent deference to the House of Commons was part of the antique cast of his mind, he possessed the moral temperament which the part of prime minister required in time of war. He felt most deeply what all felt when the crisis came, and had the confidence of the people that he would do most effectively what all wished to see done.

It was in the war years, perhaps, that his rich and colorful oratory reached its heights, though his speeches sometimes lacked measure, he used too many adjectives, and he constantly interrupted the evolution of his theme to catch some image or some phrase which had glittered at him from the outskirts of his mind. Nevertheless the benches were packed when he spoke in the House, the sound of his voice varying its tones from lusty recital to half-humorous comment; and for his memorable broadcasts he had all the world for an audience. After the remnants of the British Army had been evacuated from Dunkerque, he promised Parliament: "We shall fight on the beaches, we shall fight on the landing grounds, we shall fight in the fields and in the streets, we shall fight in the hills—we shall never surrender"; and two weeks later: "Let us therefore brace ourselves to our duty and so bear ourselves that, if the British Commonwealth and Empire lasts for a thousand years, men will still say, 'This was their finest hour.'" During the Battle of Britain he paid tribute to the Royal Air Force: "Never in the field of human conflict was so much owed by so many to so few." When suggestions were coming from across the Atlantic in 1942 as to the future status of dependent peoples, he warned: "We mean to hold our own

... I have not become the King's First Minister in order to preside over the liquidation of the British Empire." At Harvard, on receiving an honorary degree in 1943, he said: "Let all of us who are here remember that we are on the stage of history, and that whatever our station may be, whatever part we have to play, great or small, our conduct is liable to be scrutinized not only by history but by our own descendants."

He led the British Empire through nearly six years of war against Germany, bringing it to victory after its greatest crisis since Napoleonic times. Often in his long political career he had stood alone. Now, as Marlborough before him, he was the incarnation of British tenacity, the savior of his nation, the spokesman of the highest aspirations of a Europe at war. He was the statesman who laid the basis for the grand alliance of the United Nations, and therewith one of the principal architects of victory. However, notwithstanding his proven record as a war leader, he and his Conservative Party were repudiated by the country before the peace had been made, and while he was still conducting at Berlin negotiations of fateful importance for the future of Britain and the world. A bitter campaign on domestic issues followed dissolution of Parliament in June 1945 and at the ensuing general election Labour won a decisive victory. Although retaining his seat in the House of Commons, Churchill vacated the premiership in favor of Clement Richard Attlee (q.v.), and in a valedictory expressed his profound gratitude to the British people for the kindness "shown toward their servant."

CIO. See LABOR CONDITIONS IN THE UNITED STATES.

CITRUS FRUITS. October 1 estimates for the 1945 production of these fruits, which include oranges, tangerines, grapefruit, lemons and limes, were omitted by the United States Department of Agriculture, due to the fact that in California, the largest producer of oranges, and the only listed producer of lemons, the picking season usually extends from October 1 to December 31 "of the following year."

Oranges.—The 1944 orange crop of the United States totaled 112,933,000 boxes (including 3,900,000 boxes of tangerines). The 1943 crop, (3,600,000 boxes of tangerines included), was 106,651,000 boxes, and the 1934-43 average crop was 76,505,000 boxes (2,780,000 boxes of tangerines included). All tangerines are credited to Florida. Of the 1944 orange crop California produced 60,323,000 boxes, and Florida produced 42,800,000 boxes. Texas produced 4,400,000 boxes, Arizona, 1,150,000 boxes, and Louisiana, 360,000 boxes. Florida's 1945 crop (October 1 estimate) was placed at 50,000,000 boxes.

Grapefruit.—Florida and Texas are the leading grapefruit producing states. Florida's 1945 crop was estimated at 32,000,000 boxes and Texas's at 24,000,000 boxes. However, in 1944, out of a total crop for the country of 51,855,000 boxes, Florida and Texas each was credited with 22,300,000. Other producing states were Arizona and California. The 1943 grapefruit crop totaled 56,090,000 boxes and the 1934-43 average crop was 37,000,000 boxes.

Lemons and Limes.—California is the only state listed as a lemon producer, and Florida holds a similar position with respect to limes. In 1944 California produced 12,300,000 boxes of lemons; 11,050,000 boxes in 1943; and an average of 11,339,000 boxes in 1934-43. Florida's 1945 lime

crop was estimated at 200,000 boxes as compared with its 1944 crop of 250,000 boxes and its 1934-43 average crop of 93,000 boxes.

CIVIL AERONAUTICS ADMINISTRATION (CAA).

During 1945 the Civil Aeronautics Administration concluded its world-wide activities in support of the armed forces, and intensified its efforts to foster a vast expansion in civil aviation. A goal of 400,000 civil aircraft in operation by 1955 was set, and a four-point program for realizing this objective was outlined: (1) Expansion and modernization of the nation's airports; (2) Sponsorship of research to improve personal aircraft; (3) Resumption of civilian pilot training and intensified aid to aviation education; (4) Simplification of regulations governing personal flying.

Looking toward improvement of the airport system, the CAA worked closely with state, local and private interests in formulating the National Airport Plan which was submitted to Congress. Under its wartime program, the Office of Airports completed 31 landing areas at locations approved by the army and navy.

Work was advanced on the modernization of Federal Airways, the system of radio-equipped routes which make possible flying during conditions of restricted visibility. Fifty seven very high frequency radio ranges, which are expected to speed up and simplify navigation by eliminating static and interference, were assigned for survey and construction, with engineering and preparation of plans and specifications approximately 70 per cent completed. The CAA Experimental Station at Indianapolis began work on the adaptation of radar to civil aviation, using equipment supplied by the armed forces.

Thirty instrument landing systems were completed at fields used by the army and three at civilian airports. Procurement, surveying or construction of instrument landing systems was under way at another 15 military and 47 civilian fields.

War activities by Federal Airways included establishment for the army of air traffic control centers at Guam, Kwajalein and Johnston Islands and for the navy at Bermuda; training of many traffic controllers for the armed services of the United States and allied nations; and expansion of the CAA's worldwide radio network by completion of transoceanic stations at Balboa, Canal Zone, San Juan, Puerto Rico, and Miami.

Office of Safety Regulation also played a dual role. It tested many cargo and transport aircraft built for the armed forces; handled allocations of lower grades of gasoline to distributors; and enforced wartime security restrictions on civil flying. At the same time it attempted to cope with a spreading interest in civilian flying, giving more than 190,000 examinations for original airman certificates compared with 118,000 in the previous year. Among the steps taken to simplify the requirements for private flyers was issuance of a condensed medical examination form for use by any registered physician.

The program of technical assistance to state and local education authorities concerned with introducing or improving aeronautic courses in the schools was continued, with emphasis on a redirection toward peace time conditions. The Office of Aviation Training also supervised aviation courses for young men from the American republics at 4 centers in this country and assisted the governments of Mexico and Brazil in continuing training activities.

CAA personnel also were active upon the international scene as participants in the Provisional International Civil Aviation Organization.

Research projects undertaken during the year included a study of the relationship between visual standards for civilian pilots and flight performance.

To meet growing demands for information about civil aviation, the Office of Aviation Information issued numerous special publications, including a statistical handbook, a draft *Spanish-English Glossary*, a report on surplus aircraft sales and other booklets.

T. P. WRIGHT,
Administrator, Civil Aeronautics Administration.

CIVIL SERVICE, United States. On August 16, 1945, immediately following the end of hostilities in the war with Japan, the United States Civil Service Commission, anticipating widespread reductions in force in the war agencies of the federal government during the first few months of peace, put into operation a program designed to provide maximum opportunities for employment, during those months, to (a) returning veterans and (b) displaced federal employees. The commission closed all its examinations and announced that, until further notice, applications for entry into the service would be accepted only from persons with veteran preference who had the right to have examinations reopened. Applications for re-employment are accepted from federal employees affected by reductions in force.

The effect of this action was to place a ban on the receipt of applications for employment from the general public—a ban which was to be lifted only in instances where the number of veteran-preference applicants and the number of persons involved in reductions in force were not sufficient to fill vacancies. The action was taken because the commission believed it would be wasteful to continue to receive applications for limited appointments from persons who were outside the federal service, and were nonveterans, if the needs of the service could be met by returning veterans and by persons already in the federal service.

Appointments continue to be "war service" appointments, as they have been since March 16, 1942. They may not exceed the duration of the war, as legally fixed, plus 6 months. The practice of holding examinations leading to permanent appointments will not be resumed until demobilization of the armed forces is virtually complete. This will give veterans an opportunity to compete for permanent appointments.

Applications for the reopening of examinations are accepted at any time from (1) honorably discharged veterans (men and women) who have service-connected disabilities, or are receiving compensation, disability-retirement benefits or pension by reason of public laws; (2) wives of veterans with service-connected disabilities who are themselves unable to qualify for appointment; and (3) widows of war veterans. Ten points are added to their earned ratings in examinations; in most instances, the names of those who qualify are placed at the top of the appropriate list of eligibles. With certain time limitations, applications are also accepted from Second World War veterans who are not disabled. Five points are added to their ratings.

Representatives of agencies in need of new personnel may interview employees in other agencies who are involved in reductions in force. Those with the necessary qualifications may be

transferred to another agency. Employees who are involved in reductions in force but are not hired by another agency through the interview method can, by qualifying in an examination, have their names placed on the appropriate list of eligibles.

At the end of July 1945, two weeks before the end of hostilities, 2,900,000 paid civilian employees were serving in the federal executive civil service in the continental United States. One month later, the number had decreased more than 100,000. The greatest decreases were in the War Department (61,000) and in the Navy Department (37,000).

In reductions in force, the order of separation is determined on the basis of tenure of employment, veteran preference, length of service, and efficiency ratings.

The Federal Employees Pay Act of 1945, effective July 1, increased the basic pay rates of all positions subject to the Classification Act of 1923, as amended. The average increase was about 16 per cent. The largest groups of employees who were not affected by these increases were (1) employees whose pay is fixed and adjusted from time to time by wage boards, and (2) Postal Service employees. The pay of Postal Service employees was increased by Public Law 134, 79th Congress, effective July 1, 1945.

During the first 8 months of 1945, more than 134,000 veteran placements, including placements of wives of disabled veterans and widows of veterans, were made in the federal service. Veteran placements between Jan. 1, 1943 and Aug. 31, 1945 totaled 413,265. Between July 1, 1944 and July 31, 1945, 23,406 veterans were restored to positions in the federal service in accordance with the Selective Training and Service Act.

Early in the Second World War, the Civil Service Commission adopted a policy of making a greater number of federal positions available to persons with severe physical impairments. Physical capacities of impaired workers were "matched" with the physical demands of thousands of different kinds of jobs. Between Oct. 1, 1942 and Aug. 31, 1945, 65,190 physically impaired persons were placed in federal jobs. The number placed in August 1945 was 1,961; 739 were veterans.

HARRY B. MITCHELL,
President, U. S. Civil Service Commission.

CLARK, Kenneth Sherman, American composer and music editor: b. Pittsburgh, Pa., May 25, 1882; d. Princeton, N.J., Jan. 22, 1945. A pioneer in the field of community singing and long active in music publishing circles, Mr. Clark is probably best known to the public for having written four of the most popular traditional Princeton songs. During his senior year at Princeton, he completed the words and music to *The Princeton Jungle Song*; in 1910, he wrote *Going Back to Nassau Hall*; while Princeton, *That's All and Princeton*, *Forward March* followed a few years later. See also under **MUSIC—Necrology**.

CLARK, Mark Wayne, United States Army officer: b. Madison Barracks, N.Y., May 1, 1896. General Clark directed Allied operations for the long and costly Italian campaign (Sept. 9, 1943–May 2, 1945), first as head of the Allied Fifth Army, finally as commander in chief of the Allied Fifteenth Army Group. A graduate of the United States Military Academy (1917), he served with the 11th Infantry in France in the First World War, and was later stationed with

the Army of Occupation at Coblenz. In 1925, he completed courses at the Infantry School; in 1935, at the Command and General Staff School; and 1937, at the Army War College. He was a member of the General Staff Corps, in 1935–36, and again in 1937–40 and March–June 1942. In July 1942, he was given command of United States ground forces in the European theater, and in the fall of that year, led a successful secret mission to secure information in North Africa preparatory to the Allied invasion of that country. For this latter achievement, he was awarded the Distinguished Service Medal and promoted lieutenant general. For the final phases of the North African campaign (November 1942–May 1943), General Clark was deputy commander in chief of American forces, and in September 1943, led troops of the Allied Fifth Army invading the Italian mainland. He joined forces with Gen. (now Field Marshal) Sir Bernard L. Montgomery's British Eighth Army on September 17 for the drive up the Italian boot. General Clark directed the opening of a new front in Italy on Jan. 22, 1944, with a surprise Fifth Army landing on the Italian west coast, south of Rome. He was named commander in chief of the Allied Fifteenth Army Group in that theater in late November 1944, replacing Field Marshal Sir Harold R. L. G. Alexander. On April 9, 1945, as the battle for Germany neared an end, General Clark shattered the four months' lull on his "forgotten front." In a 22-day drive his Fifteenth Army Group routed 25 German divisions—the British, Eighth sweeping up the Adriatic coast and the Allied Fifth down from the Apennines to crush all German resistance in Italy on the banks of the Po River. Unconditional surrender terms were signed by the Nazis on April 29 at Allied headquarters at Caserta. General Clark was promoted full general (temporary) in March 1945; at that time, he held the permanent rank of brigadier general in the Regular Army.

CLARK, Thomas Campbell, United States Cabinet official: b. Dallas, Texas, Sept. 23, 1899. On May 23, 1945, Mr. Clark was appointed attorney general of the United States to succeed Francis Biddle. He has been with the Department of Justice since 1937, when he gave up private law practice to become special assistant to the attorney general. He was chief of the west coast offices of the department's Antitrust Division, 1940–42, and head of the War Funds Unit and first assistant to the assistant attorney general, Antitrust Division, 1942–43. In March of the latter year, he supplanted Thurman Arnold as division head, and has been outspoken in the matter of business practices he considered monopolistic. In August 1943, he transferred from the antitrust to the criminal division. Son of a well-known Texas lawyer who died several years ago, Mr. Clark was educated at Virginia Military Institute, 1917–18, and at the University of Texas, where he took his A.B. degree in 1921, his LL.B. in 1922. Admitted to the Texas bar, he practiced law in Dallas with his father and brother until 1927. From 1927–32, he was civil district attorney for Dallas County, a position he resigned to enter private practice.

CLAY. According to the United States Bureau of Mines, domestic clay, including fuller's earth, sold or used by producers in 1944 totaled 17,295,328 short tons valued at \$36,855,275, as compared with 20,818,191 tons valued at \$39,704,978 in 1943. Approximately 40 per cent of

the 1944 output was consumed in heavy clay products, 31 per cent in refractories, 16 per cent in portland cement, 3 per cent in paper, and 2 per cent in pottery. Some clays that have specialized industrial uses fared very well in 1944, while others that serve the construction field were at a very low ebb. Fire clay, including stoneware clay, sold or used by producers in 1944 amounted to 6,344,383 short tons valued at \$14,167,118, as compared with 7,798,233 tons valued at \$17,218,446 in 1943, a decline of 19 per cent. Sales of ball clay in 1944 totaled 155,667 short tons valued at \$1,376,096, as compared with 147,785 tons valued at \$1,271,474 in 1943, an increase of 5 per cent. Consumption of kaolin or china clay amounted to 873,056 tons; of bentonite, 546,768 tons; and of fuller's earth, 294,737 tons. Imports of clay of all kinds in 1944 totaled 66,507 short tons valued at \$661,129 as compared with 71,517 tons in 1943 valued at \$730,693. Exports of clay in the two years were: 181,199 tons valued at \$2,068,562 in 1944; 163,568 tons valued at \$1,814,289 in 1943. Most of the exports were of fire clay and fuller's earth.

CLENDENING, Logan, American physician and writer: b. Kansas City, Mo., May 25, 1884; committed suicide, Jan. 30-31, 1945. Dr. Clendening's syndicated column, "Diet and Health," appeared in more than 400 newspapers, with a total circulation of many millions, and his books on popular medical subjects sold in large numbers.

Although ill-health forced Dr. Clendening to leave the University of Michigan after three years, he received his M.D. degree in 1907 at the University of Kansas, and began practice in Kansas City, Mo., in 1909. He had served on the faculty of the University of Kansas in various capacities since 1910, and was professor of clinical medicine there since 1928. He served in the First World War as a major in the Medical Corps, and for a time was chief of the Medical Service Base Hospital at Fort Sam Houston. Among his better known books are *The Human Body* (1927); *The Care and Feeding of Adults* (1931); *Behind the Doctor* (1933); *The Balanced Diet* (1936); *A Handbook to "Pickwick Papers"* (1936); and *Source Book of Medical History* (1942).

COAL. With the war over, the reconversion of the coal industry to a peacetime economy is one of the most important problems facing the former belligerents. So far as the United States is concerned, the purely physical part of the reconversion boils down to the simple matter of consigning a shipment to an automobile plant instead of a munitions plant. But in war devastated Europe the situation is radically different. Lack of labor, of tools, and of an adequate food supply, superimposed on the physical, mental and moral degeneration that has inevitably followed six years of war, has left the coal industry in most of the occupied countries in even worse condition than existed during German occupation. In Germany itself the situation is no better. Discounting the normal fuel consumption of these countries on a prewar basis, the fuel supply in most of Europe during the winter of 1945-46, fell far short of the bare minimum necessary to stave off freezing and starvation, through lack of ability to process foodstuffs. Practically every country overrun by the war experienced a winter of privation, hardship and suffering from lack of fuel that was worse than at any time during the war.

United States.—The 1943 total of 650,820,689 short tons of coal produced in the United States increased to 683,700,000 tons in 1944, with anthracite and bituminous each contributing about the same proportion to the increase of 5.1 per cent. Production during the first nine months of 1945 amounted to 40,834,000 tons of anthracite and 437,838,000 tons of bituminous coal, totaling 478,672,000 tons. This total is 8 per cent below that of the corresponding period of 1944; the production rate throughout 1945 was consistently below that of 1944. The breakdown of the total output of the war years is shown in the following table:

Year	Anthracite	Bituminous	Total	Change
1939	51,487,377	394,855,325	446,342,072	+14.4%
1940	51,484,640	460,771,500	512,256,140	+14.8
1941	56,368,267	514,149,245	570,517,512	+11.3
1942	60,327,729	582,692,937	643,020,666	+12.7
1943	60,643,620	590,177,089	650,820,689	+1.2
1944	63,701,363	620,000,000	683,700,000	+5.1
1945	52,894,000 ¹	554,253,000 ¹	607,147,000	-8.0

¹ Total through December 15.

In November 1944 the weekly production rate for bituminous coal fell below that for the corresponding weeks of the previous year, and except for half a dozen scattered weeks, remained lower throughout the first three quarters of 1945. In anthracite there was a similar lag, aggravated by an almost complete stoppage during most of May 1945. As a result production during the first three quarters of the year was 8 per cent less than in the same period of 1944 for bituminous, and 16 per cent less for anthracite.

Sporadic strikes began to break out in the bituminous industry late in September 1945, and by mid-October production had dropped by one half. Then, when there seemed little if any hope of an early agreement, on October 18 the strike was suddenly and dramatically called off "in the public interest," with orders for the strikers to return to work the following Monday. Production losses incident to the strike were close to 20,000,000 tons.

Stocks of coal in storage have declined by half since the end of 1942, and at the end of April 1945 were down to a 30 days' supply. During the summer months this figure was increased to 38 days. The country was in a poor position to face a prolonged strike even were other conditions normal. With the reconversion program just started, with insistent calls for coal for devastated Europe, with our own home bins only partly filled, due to rationing regulations, and with industrial stocks at a low level, the situation was critical—a fact which doubtless had been viewed as a pronounced asset by the labor leaders responsible for the strikes.

Under the pressure of war demand coal production in the United States showed a steady expansion from 1939 to 1944, the total for 1944 being more than a half greater than that for 1939. This heavy increase was made in the face of steadily decreasing labor force, from which more than 10 per cent had been drafted for military service. Furthermore, the labor force was kept from still worse shrinkage only by the recruiting of new, unskilled replacements, and by the return to work of many older men who, though competent, were less vigorous than the younger men whom they replaced. Under these conditions the war record of the coal industry is one that can be regarded with justifiable pride by all who contributed to it, and is marred only by the repeated strikes, in violation of the no-strike pledge which labor had voluntarily given.

Austria.—Fuel supply conditions in Austria in 1945 were serious. Prewar consumption was 7,000,000 tons a year, only half of which was home production. The 1945 output was only one-quarter normal, and imports were scarce. Hungary was Austria's only source of supply, but substantial additions were hoped for from Poland later.

Belgium.—Production was gradually improving, but was still far below the prewar level of 2½ million tons monthly. In October, output had increased to 60,000 tons daily.

Canada.—Coal production in Canada in 1944 totaled 17,010,117 short tons, as compared with 17,859,057 tons in 1943. Of the 1944 total, 11,767,523 tons was bituminous, 728,364 tons sub-bituminous, and 4,514,230 tons lignite. The heaviest reductions were in bituminous in Nova Scotia and lignite in Saskatchewan. Demand increased slightly. Exports declined by almost 100,000 tons, while imports increased slightly less; net imports rose from 27,742,553 tons in 1943 to 27,916,685 tons in 1944. The average number employed increased from 24,880 in 1943 to 25,203 in 1944.

During the first seven months of 1945 Canadian production was 9,547,995 tons, against 9,555,919 tons in the same period of 1944. Increases of 10.5 per cent in Alberta, 13 per cent in Saskatchewan, and 16 per cent in New Brunswick were more than offset by losses of 9 per cent in Nova Scotia and 18 per cent in British Columbia. Imports for the same period dropped materially being only 12,078,233 tons against 14,775,702 tons in 1944. Exports continued to decline, dropping more than in the full year of 1944.

Czechoslovakia.—Coal production in August 1945 was reported to be only 450,000 tons against monthly requirements of 800,000 tons. Labor was short and an additional 15,000 more miners were needed.

France.—By a decree dated Dec. 13, 1944, the administration of coal mines in the departments of Nord and Pas-de-Calais was taken over by the state, and a collective administration was set up. It was apparently intended later to incorporate into the scheme all of the other important coal producing areas of France.

Production was far below the level of the country's needs. Output at the end of September 1945 was 757,000 tons weekly, or at a rate of 3,100,000 tons monthly, against minimum requirements of 3,500,000 tons.

Netherlands.—As compared with a prewar high of 45,000 tons daily, output in July 1945 was down to 16,000 tons. Minimum requirements are 26,000 tons. Even in the first half of 1944, under German occupation, production was 34,000 tons daily.

Poland.—The resumption of normal operation was apparently making fair progress in Poland in 1945. No production figures have been seen, but during the second quarter of 1945, 76 mines were reported to have resumed operation. Under a 1945 agreement, Polish coal will be supplied for the Rumanian railway system.

Great Britain.—British coal production in 1944 totaled 192,745,700 long tons, as compared with 198,919,700 tons in 1943. Underground mine output declined, but open pit mines showed a good increase. In 1944 the underground total was 184,098,400 tons, and open pit 8,647,300 tons. Mines in operation dropped from 1,782 in 1943 to 1,720 in 1944, while wage earners increased from 707,800 to 710,200. Output per man-year dropped from 274.8 tons to 259.2 tons, and aver-

age costs increased from 28s. 2d. to 33s. 3d. Home consumption was estimated at 185,400,000 tons, leaving little surplus.

Excluding absenteeism, the production loss attributable to various causes was: authorized holidays 8,493,600 tons, disputes 3,001,700 tons, accidents, breakdowns and repairs 1,603,800 tons, transportation difficulties 587,900 tons, other reasons 435,500 tons, total 14,122,500 tons. Losses from absenteeism were not reported, but of the total 41 per cent was voluntary and 59 per cent involuntary. See also MINES, U.S. BUREAU OF.

G. A. ROUSH,

Editor, The Mineral Industry.

COAST AND GEODETIC SURVEY, United States.

The beginning of the fiscal year saw the tidal work of the bureau and of the main ship hydrographic parties concentrated in the western Pacific. In anticipation of landings on the China coast and the main Japanese islands, tidal predictions had been furnished for 650 different beaches. In addition, predictions were made concerning the tidal currents to be expected offshore. This essential information for successful landings was obtained by use of the Tide Predicting Machine, a mechanical calculator upon which were set those factors needed to reproduce the curve delineating the rise and fall of the sea for each hour through the next twelve months. These factors had been secured through research of the bureau's files which contained the actual or predicted tides for previous years, before censorship had cut off the flow of such data from these foreign shores in an exchange for scientific use.

Five main ships of the survey fleet continued hydrographic surveys in the Western Aleutian Islands and in the waters extending from Adak to Attu. New charts issued early in 1945 were from previous years' surveys and the current season saw the extension of these surveys into further uncharted waters. The accomplishment of this work has been a vital need to the patrol ships of the navy and the deep draft vessels of the army and merchant marine carrying supplies and personnel to those essential military bases in the Aleutian Islands.

An expedition was sent to Point Barrow where surveys were carried out except when ice conditions prevented operations. The work of this group furnished the data for the first Coast and Geodetic Survey marine charts of the Arctic coast of Alaska.

Observations of the direction and intensity of the earth's magnetic field were continued at five Coast and Geodetic Survey observatories located in the United States, Alaska, Puerto Rico and Hawaii. Changes in variation and in other magnetic elements were noted to provide information for use with magnetic equipment for geophysical prospecting and for compass surveys. True azimuth marks and the magnetic north directions were established at 70 airports in 30 states to permit precise compass adjustments for airplanes.

Isogonic charts over world air routes from best available information were produced for use by army and navy fliers. Five major seismographs were operated by the Coast and Geodetic Survey and assistance was given eleven universities and seven private stations in the operation of seismic stations throughout the country. In the program of engineering seismology, 60 strong motion instruments were maintained in western states and studies were made of vibrations of buildings and foundations.

During the past year, geodetic control surveys were extended into the Columbia and the Missouri River valleys for the proposed investigations for flood control, power and reclamation development by the Army Engineers and the Bureau of Reclamation. Additional area coverage and breakdown of the main transcontinental arcs of triangulation were made in particular localities at the request of several cities and state engineers, and for federal topographic mapping.

More friendly relations with the other American republics were developed through an exchange of experts in surveying and mapping. Through arrangements with the State Department 30 trained engineers from 14 American republics were instructed in field methods and equipment in the United States.

Because of the great movement of troopships and of the merchant marine, there was maintained throughout the year the large demand of the war years for marine charts of our coastal waters. The accuracy of these charts was maintained by constant revisions. Over four million copies of 837 individual coastal charts were produced and issued. Printing of the aeronautical charts of the United States, 134 in number, continued during the year, but at a lessening rate after the defeat of Japan. There were compiled and printed for the Army Air Forces about six million charts of foreign areas.

The following is a list of new volumes relating to the functions of the Coast and Geodetic Survey which have been issued this year: *Practical Air Navigation*; *General Theory of Equivalent Projections*; *United States Earthquakes*; *Coast Pilots of United States Waters*; *Tables of Prediction of Tides for 4,200 World Ports*; *State Co-ordinate Systems*; *Tidal Bench Marks for Florida Gulf Coast*; and *Surface Water Temperatures of the Pacific Coast*.

LEO OTIS COLBERT,
Rear Admiral; Director, United States Coast and Geodetic Survey.

COAST GUARD, United States. Charged since its creation in 1790 with the peacetime functions of safety of life at sea and of a maritime police, the United States Coast Guard at war, operating as a service under the navy since November 1941, continued to perform these functions in their application to the prosecution of the war, and simultaneously played an important role in naval patrols, troop transportation, and in landing operations of the armed forces in the offensives of the European and Pacific theaters of war.

Coast Guard Goes to War.—From the very outset of war, coastguardsmen were in action against the enemy—aboard rugged combat cutters which duelled Nazi submarines in the North Atlantic and on invasion craft which carried troops and supplies ashore during almost every amphibious operation. As Allied smashing offensives penetrated deep into the enemies' territory during 1943 and 1944, the danger of hostile landings on our coasts lessened, permitting certain relaxations in antisubmarine and shore patrol home-front security assignments, thus enabling the Coast Guard to meet increasing demands from the Joint Chiefs of Staff for additional thousands of men for duty in combat areas across both oceans. Serving on LST's, LCI's, troop transports, and other ships of the invasion and auxiliary fleets, coastguardsmen were active in Africa, Sicily, Italy, Normandy, and Southern France, helping to establish and back the fighting fronts.

The release of increasing numbers of coastguardsmen from beach patrol, port security, and other defense duties for overseas assignments, and the assignment of SPARS, the Women's Reserve of the Coast Guard, to duty in Hawaii and Alaska, resulted in sending overseas more than half the 172,671 (as of April 3, 1945) officers, enlisted men, and SPARS of the Coast Guard.

When the fighting focus turned to the Pacific, Coast Guard-manned transports began helping with the gigantic task of moving troops from one side of the globe to the other; the fleet of 83-foot patrol boats, known as the Coast Guard Rescue Flotilla and famous for rescuing over a thousand lives while on duty in the English Channel on D-Day and the weeks that followed, was transferred to the Pacific to serve with the invasion forces there where Coast Guard landing craft began preparing for new amphibious invasions. In addition to these ships, the Coast Guard was scheduled to man 582 navy and army combat vessels at the completion of a program mapped out soon after hostilities in Europe ceased.

Aside from manning these hundreds of ships, coastguardsmen were also assigned to strategic communications installations at far Pacific bases. Operating secret electronics equipment, specially trained coastguardsmen were charged with maintaining the stations urgently required for navigational assistance to ships and aircraft.

By directive from the Joint Chiefs of Staff and the secretary of navy, the Coast Guard commandant was named head of a newly created Air-Sea Rescue Agency, delegated to develop and disseminate safety techniques for the rescue of men at sea. To this end, the Coast Guard's air arm, operating from nine coastal stations, was greatly expanded, while Coast Guard rescue communications networks and high frequency radio installations similarly were enlarged to meet new needs. Meantime, in Greenland and Labrador, where there is some of the most hazardous flying in the world, Coast Guard airmen operated patrol squadrons for the double purpose of antisubmarine patrol and the plotting of ice movements along North Atlantic convoy routes. Foreseeing in its peculiar flight qualities wide possibilities for rescue operations, the Coast Guard is conducting exhaustive experimentation with helicopters.

Peacetime Functions.—But through all this, through whatever new assignments and duties it may have received, the Coast Guard remained responsible for the execution of peacetime functions and for the discharge of added tasks made necessary by the war. While many port security activities were eliminated with the lessening danger of sabotage, the Coast Guard continued to guard harbor and waterfront facilities at the large ports of embarkation, through which passed all troops and supplies moving overseas. This work was done largely by thousands of civilian volunteers who enlisted in the Coast Guard Temporary Reserve to serve a minimum of 12 hours each week without pay on waterfront security watches. As of April 21, 1945, more than 53,680 civilians were serving in the Temporary Reserve. As danger of enemy operations along our coasts diminished, the Coast Guard began placing many of the Temporary Reservists on inactive duty. It also restored to use as many aids to navigation as possible. The Coast Guard is responsible for the operation and maintenance of some 34,500 aids to navigation (including lightships, lighthouses, radio beacons, buoys, etc.) on all rivers and coasts of the United States and the waters of

outlying territories and possessions, including Alaska, Hawaii, Puerto Rico, and newly acquired islands and bases.

With our greatest merchant marine fleet in history committed to the transport of troops and supplies across all the thousands of miles to fighting fronts, the Coast Guard counted as one of its most important responsibilities the inspection and enforcement of safety requirements on these vessels. Experienced Coast Guard officers and men tested and inspected lifesaving and fire-fighting devices, looked after the efficiency and welfare of merchant marine personnel, and governed the proper manning of all merchant marine vessels. Through the Merchant Marine Council, the Coast Guard assumed the initiative in promoting closer understanding and co-operation among the varied maritime interests. At these meetings, seamen and operators met together to serve the best interests of our merchant fleet.

At more important ports and harbors overseas, the Coast Guard detailed Merchant Marine Hearing Units for the immediate adjudication of all matters involving a breach of regulations or of discipline at sea.

Always a dramatic activity of the Coast Guard's ceaseless task in maintaining safety of life at sea, are the ice breaking operations in the Great Lakes, along the Atlantic Coast, and up into Greenland and other Arctic areas, where sometimes it has been necessary for Coast Guard ships to poke their bows into the Arctic ice pack. It was one of the Coast Guard's specially constructed ice breakers which destroyed a German meteorological station on the northeastern coast of Greenland, foiling a German ambition for securing vital weather forecasts. For the benefit of the United States Weather Service, and to provide important information for our overseas air operations, the Coast Guard maintained 24 vessels on weather patrol duties.

Celebrating its 155th anniversary on Aug. 4, 1945, the Coast Guard looks back on a long record of outstanding service through peace and war, under both the Treasury Department and the navy; but even more than this, men and women of the Coast Guard are determined, no matter where their service might carry them, that they should keep faith with the Coast Guard's pointed motto—*Semper Paratus* (Always Ready).

R. R. WAESCHE,
Commandant, United States Coast Guard.

COFFEE. The Bureau of Customs announced on Oct. 3, 1945, preliminary figures showing the quantities of coffee authorized for entry for consumption under the quotas for the 12 months commencing Oct. 1, 1944, provided for in the Inter-American Coffee Agreement, proclaimed by the President on April 15, 1941, as follows:

Country of Production	Quota Quantity (Pounds) ¹
Signatory Countries:	
Brazil	2,353,628,932
Colombia	796,794,513
Costa Rica	50,615,676
Cuba	20,246,297
Dominican Republic	30,369,379
Ecuador	37,961,757
El Salvador	151,847,028
Guatemala	135,396,920
Haiti	69,596,621
Honduras	5,061,541
Mexico	120,212,296

Country of Production	Quota Quantity (Pounds) ¹
Signatory Countries:	
Nicaragua	49,350,324
Peru	6,326,893
Venezuela	106,292,893
Nonsignatory Countries	89,842,785
Total	4,023,553,955

¹ Quotas as of June 1, 1945, determined by action of the Inter-American Coffee Board on May 29, 1945.

COINS AND COINAGE. See MINT ESTABLISHMENT, UNITED STATES.

COKE. In 1944 the coke industry with increased by-product coking capacity surpassed all earlier production records, supplying coke and by-products vitally needed for war and other essential industries. According to the United States Bureau of Mines, the combined production of by-product and beehive coke was 74,037,817 net tons in 1944—67,064,795 by-product, and 6,973,022 beehive—an increase of 3 per cent over 1943. This ultimate increase of 3 per cent in the record output was registered from a 5 per cent increase in production of by-product coke and a proportionate decrease of 12 per cent in the output of beehive coke, resulting generally from the expansion of by-product coke-making facilities. Consumption of by-product and beehive coke in 1944 increased 2 per cent over the previous maximum of 1943 and amounted to 72,999,670 net tons, of which by-product coke ovens supplied 91 per cent. The total value of coke, produced and sold in the United States in 1944 amounted to \$736,153,019; by-product, \$686,910,035; beehive, \$49,242,984.

COLOMBIA. A republic in northwestern South America, bounded on the west by the Pacific Ocean and Panama, on the south by Ecuador and Peru, on the east by Brazil and Venezuela, and on the north by the Caribbean Sea. It is the only South American state with both Atlantic and Pacific coastlines. Colombia is traversed by three chains of the Andes; much of the western and southern portions lie in the Orinoco and Amazon drainage basins. The area is 439,828 square miles, making Colombia the fourth largest country in South America. Population was estimated Jan. 1, 1945, at 10,082,000; most of the population lives on the north coast and in the Andean highlands; Antioquia and Cundinamarca are the most populous departments. The principal cities are Bogotá, the capital (est. pop., 434,240), Medellín (215,830), Barranquilla (202,760), Cali (133,140), Manizales (108,260), Cartagena (100,360), Buenaventura (30,000), Ibagué (61,447), Cúcuta (57,248), and Pasto (49,644). Colombia was visited by Columbus, for whom it was named, on his fourth voyage in 1502. In the 18th century it formed an important part of the viceroyalty of New Granada. Under the leadership of Simón Bolívar Colombia won its independence from Spain in 1819 and for ten years thereafter continued united with

Venezuela and Ecuador in a confederation now called Great Colombia. Disintegration of the confederation in 1829-30 led to the continuance of Colombia, then called New Granada, as a separate state. Colombia underwent several changes in form of government in the 19th century under different constitutions, the present one being adopted in 1886; extensive amendments were put into effect Feb. 12, 1945. Colombia now has a unitary government, with a president popularly elected for a four-year term, a bicameral congress, a council of state, and a judiciary headed by a Supreme Court of Justice. The Senate has 63 members and the Chamber of Representatives 131. The principal parties are the Liberal (in power since 1930) and the Conservative. The republic is divided territorially into 14 departments, 4 intendencies, and 6 commissaries.

Religion and Education.—Roman Catholicism is the state religion and Colombia is one of the most strongly Catholic of all Latin American countries, though freedom of worship is permitted. Colombia has four Catholic archbishoprics (Bogotá, Cartagena, Popayán, and Medellín) and 13 bishoprics. The first Inter-American Congress of Catholic Education, attended by delegates from all American republics, opened in Bogotá June 2 with messages from President López and Pope Pius XII.

Primary education is free though not compulsory; both the government and the Catholic Church participate in it. Literacy, according to the 1938 census, was 43.3 per cent. The latest education statistics showed 19,901 primary schools with 685,317 pupils, 776 intermediate schools with 58,980 pupils, and eight universities with 3,713 enrolled. The national university at Bogotá was founded in 1572 and became autonomous in 1935. There are other institutions of university level at Bogotá, Medellín, Popayán, Cartagena, and Pasto.

Communications.—The mountainous topography is a serious obstacle to surface transportation, although in recent years the government has undertaken an extensive road-building program. Railway mileage totals 2,046. The government owns and operates the seven main railroads of Colombia and in 1945 was planning construction of an additional 1,180 miles; private and departmental lines also operate. Generally speaking, railways have deteriorated during the past few years because of the difficulty of obtaining new equipment and repair parts. Railway traffic increased, however, from 5,800,000 passengers and 1,500,000 tons of freight in 1941 to 12,000,000 passengers and 2,900,000 tons of freight in 1944. The most ambitious construction projects are the extension of a southern line from Popayán to the Ecuadorian border and the linking of two important railroads by a short line from Ibagué to Armenia. Colombia has 5,682 miles of national roads and 3,950 miles of departmental roads, of which 239 miles are paved; there are some 20,000 more miles of unimproved roads. There are two main highways from north to south and an important transversal highway from the Venezuelan border to Medellín. January saw the first truck trip from the Pacific port of Buenaventura to Cali over a recently completed important road. A 10,000,000-peso bond issue authorized in 1945 included P4,600,000 for military highways. Highway transportation deteriorated badly in 1944 because of lack of equipment. Colombia's most important inland waterway, the Magdalena River, is constantly

used to transport goods between the interior and the port of Barranquilla; it is navigable for 880 miles. Other important rivers and their navigable lengths are the Cauca (630 miles), the Caquetá (1,430 miles), the Putumayo (1,000 miles), and the Meta (680 miles). Silting of the Magdalena channel at Barranquilla in late 1944 and early 1945 caused serious freight congestion at nearby Cartagena and at Buenaventura and on the country's railways and roads. Avianca, a Pan American Airways affiliate company, has a large network of airlines covering all parts of Colombia. It provides daily plane service from Bogotá to all principal cities. Its service was completely disrupted by a serious strike, Nov. 11-18, 1944. Steps have been taken to construct, with government aid, new and enlarged airports at Bogotá and at Leticia on the Amazon. Organization of a new airline, Líneas Aéreas Taca de Colombia, was completed early in 1945. KLM, the Dutch airline, was authorized for flights to Bogotá. Colombia had a 1944 vehicle registration of 13,319 passenger cars, 3,177 busses, and 8,016 trucks. Recent statistics show a total of 1,075 telegraph offices with 21,594 miles of line, 41,710 telephones with 135,500 miles of line, 105 radio broadcasting stations and about 175,000 receiving sets, and 823 postoffices. Plans are in process to link the telephone systems of the country. Bogotá plans 10,000 new phone lines by April 1947, and will transform its phone service entirely to an automatic basis by October 1949.

Production.—Colombia is primarily agricultural, with more than 3,000,000 people engaged in farming and stock raising. Agricultural production normally represents about 40 per cent of all national production. Principal crops are coffee, corn, sugar-cane, bananas, wheat, rice, and potatoes. The livestock population is estimated at 10,000,000 cattle, 1,600,000 hogs, 1,000,000 sheep and 600,000 goats. Estimated production of principal crops for 1944 was as follows: coffee, 5,500,000 bags of 60 kilograms; (the following, all in metric tons): rice, 65,000; sugar, 72,199; wheat, 100,000; cacao, 7,500; beans, 36,000; corn, 653,132; bananas, 713,998; yucca, 1,053,950; potatoes, 418,000; cotton, 4,800. Of these crops, wheat, rice, and sugar showed slight increases over 1943 production; cotton production was up 9 per cent. The National Federation of Coffee Growers unsuccessfully continued its efforts to get a higher price from the United States. Cattle slaughtering in 1945 was expected to be 1,200,000 head. President López in March 1945, approved a five-year plan for agricultural development and it was anticipated that the national budgets, 1945-49, would include from 7,000,000 to 9,000,000 pesos annually for such a purpose. Colombian mineral production is also very important, the chief items being petroleum, gold, silver, platinum, emeralds, salt, and coal. Production figures included: gold, 553,531 troy ounces (as against 565,501 ounces in 1943); platinum, 34,259 troy ounces (1943: 34,563); silver, 197,323 troy ounces (1943: 209,950); crude petroleum, 22,647,476 barrels (1943: 13,500,000). Terrestrial salt to the amount of 93,863,518 tons was produced in 1943, mostly from the huge government-owned salt mines at Zipaquirá. Iron ore deposits in Boyacá were actively developed in 1945. The value of gold and silver produced in 1944 was \$19,181,000; 60 per cent of each metal came from Antioquia. Gold production in the first quarter of 1945 was slightly higher

than in the corresponding period of 1944. Small, but increasing amounts of rubber and cinchona were being produced in 1944-45. Industrial output is important despite large Colombian imports of manufactured goods. The chief industrial centers are Medellín, Cartagena, Barranquilla, Bogotá, Manizales, Cali, and Bucaramanga. Industrial production in 1944 was estimated to be 25 to 30 per cent greater than in 1943. The 12 leading industries at the beginning of 1944 had a fixed capital investment of 131,993,917 pesos (peso = 57 cents), the leading four being textiles, beer, sugar, and cement. Investment in 1944 alone in new Colombian enterprises was estimated at more than P50,000,000. Production in 1943 by the principal industries was valued at P213,030,326, the chief items being tiles, cigars and cigarettes, beer, cereal milling, sugar, and chocolates. Cement production in 1944 was 235,000 metric tons, a record figure but still insufficient for national needs. Early in 1945 a large hydroelectric plant was under construction at Tobia, a steel plant at Paz del Rio, and a soda ash plant near Bogotá.

Finances and Economic Conditions.—The ordinary budget for 1944 was calculated to balance at P116,145,688 and the extraordinary budget at P85,378,422. Actual collections toward the ordinary budget totalled P97,021,110 and actual expenditures P114,336,908, leaving a declared budget deficit of P17,315,898. The 1945 budget (consolidated) was calculated to balance at P171,912,406. The total public debt decreased in 1944 from P318,425,000 to P289,608,000, including an increase in the internal debt from P177,740,000 to P187,374,000 and a decrease in the external debt from P140,685,000 to P102,234,000. Ordinary national revenues for the first six months of 1945 were P56,960,000 as against P34,843,000 for the same period in 1944. The budget deficit June 30, 1945, was P12,700,000. The national debt on Sept. 2, 1945, totalled P379,068,695, an increase of P50,053,799 since June 30, 1944. The anticipated 1945 deficit of P55,000,000 was to be covered by credit operations and probably internal loans. The 1944 balance of payments reflected an export balance of \$45,543,081.37, a decrease of about \$13,000,000 from 1943. This downward trend continued and the first four months of 1945 saw an import balance of \$3,000,000.

Foreign Trade.—Colombian imports in 1943 totalled \$83,996,000 (\$8.73 per capita) and exports \$125,125,000 (\$13 per capita); the United States supplied \$46,283,000 of the imports and took \$98,419,000 of the exports. Principal import items by value in 1943 were cotton and textiles, P35,619,000; iron and steel and their manufactures, P13,580,000; pharmaceuticals, P10,731,000. Principal export items by value in 1943 were coffee, P176,135,000; crude petroleum, P20,018,000. Colombia's basic coffee quota is 3,150,000 bags of 60 kilograms, second only to the Brazilian quota. The quota was increased in 1944-45 to 4,437,607 bags. Total coffee exports in the 1943-44 crop year were 4,827,087 bags valued at \$92,417,087 as against 1942-43 exports of 4,987,641 bags valued at \$95,656,617. Coffee exports to the United States in 1943-44 were 4,155,435 bags or 23.6 per cent of total United States imports of coffee. The end of the war was expected to stimulate coffee, petroleum, and gold exports. U. S. government officials estimated that within 10 years after the war was over Colombia would require United States machinery and equipment to a value of \$241,000,-

000 with an additional \$145,000,000 needed for replacement of worn-out and obsolete equipment; the largest item, it was anticipated, would be manufacturing equipment, but other important ones were expected to be power and communications, transportation, and building.

Principal Events.—President Alfonso López in a New Year's message called for an investigation of his administration and repeated his willingness to resign the presidency; a resignation had been rejected by the congress in May 1944. A special session of the congress met January 22 to consider constitutional amendments and other matters; a comprehensive series of constitutional amendments was approved and published February 12. The state of siege imposed July 10, 1944, following the kidnapping of President López at Pasto was officially lifted February 21. The administration Liberal party reorganized its directorate February 3 to include ex-President Eduardo Santos, Gabriel Turbay, who had resigned as ambassador to the United States late in 1944 to become a presidential candidate, Foreign Minister and former acting President Dario Echandia, and Julio Roberto Salazar Ferro. The government published a new land law February 6 prescribing terms and procedures for renting or tenant farming agricultural lands, authorizing farm loans, and providing potential expropriation procedures. The government on March 11 announced discovery of several hundred bombs and hand grenades hidden in the Bogotá cathedral and charged existence of a Conservative party plot to stage disorders a few days later in order to disrupt congressional elections scheduled for March 18. A small dynamite cache was also confiscated May 31. The March elections, held as scheduled, resulted in the choice of 80 Liberals, 46 Conservatives, and five Socialist Democrats (formerly Communists) for the Chamber of Representatives; Liberals won control of 13 of the 14 departmental assemblies; the popular vote was Liberal, 560,000; Conservative, 260,000; Socialist Democrat, 25,750. Government forces on June 1 suppressed a mutiny in the Bogotá penitentiary led by Gen. Eduardo Bonitto and other army officers jailed for complicity in the 1944 Pasto coup. A tense political atmosphere in June preceded the opening of the regular session of the Congress, June 25. President López presented his resignation to that body July 19. It was accepted August 2, and Foreign Minister Alberto Lleras Camargo was inducted as provisional president August 7. The Liberal party convention on August 25 nominated Gabriel Turbay as its candidate for the presidency in the 1946 elections but supporters of Dario Echandia bolted the session and threatened a party split. The government set up a social security agency July 11. Alfonso Villegas Restrepo, noted jurist and founder of Colombia's leading paper, *El Tiempo* (Bogotá), died March 19.

RUSSELL H. FITZGIBBON,
Department of Political Science, University of California, Los Angeles.

COLORADO, Mountain state, United States; admitted to the Union Aug. 1, 1876. Population (1940): rural, 532,540; urban, 590,756; total, 1,123,296. Land area, 103,927 square miles, divided into 63 counties. Principal cities, with 1940 populations: Denver, the capital, 322,412; Pueblo, 52,162; Colorado Springs, 36,789; Greeley, 15,995.

Chief State Officers, 1945.—Governor, John C. Vivian; lieutenant governor, William E. Higby;

secretary of state, Walter F. Morrison; treasurer, Homer F. Bedford; attorney general, H. Lawrence Hinkley.

Judiciary.—Chief justice of Colorado's Supreme Court, Norris C. Bakke; associate justices, Haslett P. Burke, Benjamin C. Hilliard, William S. Jackson, William Lee Knous, Mortimer Stone, Wilbur Alter.

Legislature.—The General Assembly (Senate, 35 members; House of Representatives, 65) convenes biennially in odd years on the first Wednesday in January.

Education.—At last report (1943-44 school year), there were 1,955 public elementary schools, with 5,270 teachers and 146,404 pupils. Elementary school teachers earned an average yearly salary of \$1,300 (est.). Public junior high schools numbered 47, with 805 teachers; there were 311 senior high schools with 2,124 teachers. Junior and senior high schools had a combined enrolment of 44,594 students. Junior and senior high school teachers earned an average yearly salary of \$1,800 (est.). Education in Colorado is compulsory for all children between the ages of 8 and 16, inclusive. There are 3 teacher training schools in the state. Total state appropriation for public school education (1943-44), \$2,196,678.77. State superintendent of public instruction, Mrs. Inez Johnson Lewis.

Finances.—Following is a statement of Colorado's finances for the fiscal year 1944-45, supplied by the state treasurer's office:

Balance in treasury, beginning of fiscal year 1944-45	\$ 29,303,892.82
Receipts, 1944-45	76,196,462.19
Total	\$105,500,355.01
Disbursements, 1944-45	70,068,593.61
Balance, beginning of fiscal year 1945-46	\$ 35,431,761.40

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.)	11,335	16,283	14,740
Oats (1,000 bu.)	4,578	5,452	6,698
Wheat (1,000 bu.)	16,658	19,137	33,861
Barley (1,000 bu.)	10,729	14,986	20,619
Rye (1,000 bu.)	583	586	828
Sorghums for grain (1,000 bu.)	1,295	4,746	3,600
Sugar beets (1,000 short tons)	1,900	1,427	2,100
Peas, dry field (1,000 bags)	143	326	279
Hay:			
Alfalfa (1,000 tons) ..	1,222	1,432	1,367
Clover and timothy (1,000 tons)	214	256	273
Tame (1,000 tons)	1,660	1,910	1,866
Wild (1,000 tons)	347	388	416
Beans, dry edible (1,000 bags)	1,574	2,088	1,909
Potatoes (1,000 bu.)	14,033	18,779	19,305
Apples (1,000 bu.)	1,554	2,002	1,275
Peaches (1,000 bu.)	1,553	2,112	2,372
Pears (1,000 bu.)	195	157	263
Cherries (tons)	3,559	5,340	2,040

COMINO. See MALTA.

COMMERCE. See sections on *Commerce* or *Trade* under UNITED STATES and various foreign countries.

COMMODITY CREDIT CORPORATION (CCC). This agency of government, created in 1933, has authority to buy, sell, lend upon, and engage in other activities with respect to agricultural commodities and foods. It has an authorized capital of \$100,000,000 and may borrow, by the issuance

of obligations guaranteed by the United States, not to exceed \$4,750,000,000.

The corporation was made a part of the United States Department of Agriculture in 1939. In 1943 it became a part of the War Food Administration. On Jan. 1, 1945, the War Food Administrator effected a consolidation of several of the activities within WFA into an enlarged Commodity Credit Corporation which was made responsible for all lending, buying, selling, storage, transportation, subsidy, and price-support activities of the War Food Administration having to do with food and food facilities. It was responsible for all such activities in connection with the following unprocessed commodities: corn, wheat, cotton, tobacco, peanuts, rice, feed grains, wool, hemp, sugarcane, sugar beets and raw sugar, gum turpentine, gum rosin, soybeans, flaxseed, and cottonseed. It was also responsible for all such activities (including diversion) with respect to fruits and vegetables, livestock and livestock products, dairy products, poultry and poultry products, grain products, fats and oils, and other processed foods.

The War Food Administration was dissolved June 30, 1945, and the functions and activities of the corporation were integrated with those of other bureaus in the Production and Marketing Administration of the Department of Agriculture which began functioning Aug. 20, 1945. Since that time the corporation has continued to work to stabilize agricultural prices and improve the income of American farmers. The Commodity Credit Corporation is primarily engaged in price support activities. The Agricultural Adjustment Act of 1938, as amended, made loans mandatory to producers of cotton, corn, wheat, rice, tobacco, and peanuts and also contained a general authorization for the corporation to make loans on other agricultural commodities, including dairy products. As required by the Agricultural Adjustment Act of 1938, all such commodity loans to producers are made without recourse to borrower; that is, the corporation must look solely to the collateral for satisfaction of the loan. The Stabilization Act of 1942, as amended, directed the corporation to make loans on the basic crops of cotton, corn, wheat, rice, tobacco, and peanuts during the war and for two years after its termination at loan rates amounting to 92½ per cent of parity for cotton and 90 per cent of parity for the other basic commodities. "Parity," generally represents the price that would give the commodity a purchasing power to the farmer equivalent to its purchasing power in a base period, usually from 1909-14.

The CCC also carries out loan and purchase programs authorized under the terms of the act of July 1, 1941, as amended, which directed the Secretary of Agriculture to use the corporation's funds to support the prices of nonbasic agricultural commodities, the production of which had been expanded during the war at the request of the secretary of agriculture. Prices of these commodities are required to be supported at not less than 90 per cent of parity for the duration of the war and two years thereafter.

As of June 30, 1945, commodity loans outstanding under Commodity Credit Corporation programs amounted to \$308,572,063.32. Of this amount, loans totaling \$46,830,207.16 were held by the corporation and guaranteed loans in the amount of \$261,741,856.16 were held by private lending agencies. Cotton loans amounting to \$217,511,741.66, wheat loans amounting to \$249,719,000.97, and corn loans amounting to \$18,-

370,118.95, comprised the bulk of the total loans outstanding. During the year ended June 30, 1945, the corporation also made loans on barley, flaxseed, grain sorghums, peas, peanuts, potatoes, rye, soybeans, tobacco, naval stores, and miscellaneous seeds.

Inventories owned by the corporation on June 30, 1945, had a book value of approximately \$1,201,034,292.30. Included were 3,859,961 bales of cotton valued at \$345,877,186.79; 318,899,327 pounds of wool valued at \$160,292,439.29; 69,157,072 pounds of tobacco valued at \$35,087,597.81; and 103,728,460 bushels of wheat (including wheat pooled for the account of producers) valued at \$153,669,750.82. As of June 30, 1945, commodities owned by the corporation included barley, corn, fats and oils, grain sorghums, hemp and hemp products, oilseeds and products, rye, turpentine, general commodities, and miscellaneous seeds.

The corporation is managed by a board of directors, of which the secretary of agriculture is chairman and the undersecretary of agriculture and the assistant secretary of agriculture are members. Other members of the board, who are also officials of the Production and Marketing Administration, are: the administrator of PMA; deputy administrator, PMA; assistant administrator for regulatory and marketing service work, PMA; director of price, PMA; and director, field service branch, PMA; and assistant administrator for fiscal and inventory control, PMA.

JOHN B. HUTSON,

President, Commodity Credit Corporation.

COMMONWEALTH FUND, The. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, president of the fund from its inception until his death Jan. 29, 1940, now amounts to approximately \$47,333,000. Appropriations in the year ended Sept. 30, 1945, were \$1,644,216.90. Activities tending to promote or maintain physical and mental health accounted for three quarters of this total. More than \$375,000 was appropriated for medical research. In medical education, fellowships were offered for advanced study; provision was made for visiting instructors in medical schools; aid was given to departments of preventive medicine and psychiatry, to teaching arrangements designed to promote interplay between medicine and psychiatry, and to various forms of postgraduate instruction for men in practice. Public health activities, designed to raise standards of rural service, centered in Tennessee, Mississippi, and Oklahoma. Fourteen rural community hospitals built or remodeled with aid from the fund were at work during the year; these hospitals stress opportunities for professional education as well as standards of medical, nursing, and technical services. Personnel shortages remained general and embarrassing. The Commonwealth Fund fellowships for British graduate students at American universities were suspended during the war, but fourteen fellowships for postgraduate study in medicine and public health were awarded to Latin-Americans. The fund published in the year eight new books of educational significance in its fields of operation. Since the beginning of the war the fund set aside more than \$1,500,000 for war relief and other purposes related to war needs, including the rehabilitation of men discharged from the armed forces with psychiatric disabilities.

The directors of the fund are: Malcolm P. Aldrich (president), William E. Birdsall, Phil W. Bunnell, Adrian M. Massie, Lewis Perry, Barry C. Smith, William E. Stevenson, and Thomas D. Thacher. Its offices are at 41 East 57th Street, New York 22, N.Y.

BARRY C. SMITH,
General Director.

COMMUNITY CHESTS AND COUNCILS, Inc.

The national non-profit organization of community and war chests and councils of social agencies was organized in 1918 as a clearing house of information and to give service to the 21 chests then organized. A board of directors, an executive committee and departmental advisory committees composed of chest and council laymen and executives guide the organization's policies. It is financed by dues from its corporate members. In 1945, community chests and councils of social agencies in 438 cities were affiliated with the national organization on a voluntary membership basis.

A community chest is a co-operative organization of citizens and social welfare agencies. It has two chief functions: (1) raising funds each year through a co-operative appeal for the voluntary social and health agencies affiliated with it, and (2) promoting the social welfare and health of the community by co-ordinating existing services and planning more effective community welfare programs.

During the war, the great majority of community chests extended their scope to become "community and war chests." Community Chests and Councils, Inc., assisted in the organization and operation of the National War Fund, through temporary loans of staff, participation in policy-forming and committee work, and co-operative publications and activities. It also instituted quota and budget procedures for national war relief agencies included in the National War Fund, and in 1943 transferred these functions to the latter organization.

Of the 1,142 chests and councils in operation in August 1945 (820 chests and 322 councils), 784 chests and 303 councils were in continental United States, 4 chests and 2 councils in Hawaii, 29 chests and 17 councils in Canada, 2 chests in South Africa, and 1 chest in the Virgin Islands. Almost every city in the United States (except New York City, which has a limited joint financing organization) in 1944 had a community chest or similar plan of federated financing for its voluntary social services.

In 772 cities in 1944 more than 20 million contributions, totalling \$221,272,950 were given to community chests and war chests to be used during 1945 for voluntary social work in their communities and for National War Fund agencies. This means that chests raised an average of more than \$3 for every person in the population covered by the campaigns.

Officers of Community Chests and Councils, Inc., in 1945 were: honorary president, Gerard Swope; president, E. A. Roberts; vice presidents, J. B. Adoue, Jr., H. L. R. Emmet, Mrs. DeForest Van Slyck, and Harry P. Wareham; treasurer, Milton H. Glover; secretary, Robert P. Lane. Ralph H. Blanchard is executive director. The address of the association is 155 East 44th Street, New York 17, N.Y.

COMMUNITY TRUSTS. The philanthropic resources reported by 76 community trusts in the United States and Canada rose to an aggregate of \$67,041,684 at the close of 1944, from a total of \$57,135,194 at the end of 1943. The New York Community Trust with \$15,871,557 and the Chicago Community Trust with \$11,498,070 are the largest of these charitable trusts. Next in order of assets at Dec. 31, 1944 are the Cleveland Foundation, \$8,624,214; the Boston Permanent Charity Fund, \$5,953,107; and the Winnipeg Foundation, \$3,561,989.

Disbursements by community foundations increased to \$1,918,475 in 1944 from \$1,739,619 in 1943. The largest outpayments were those in New York, \$558,746 and Cleveland, \$279,844. Chicago with appropriations of \$268,852 and Boston with \$256,775 ranked third and fourth in volume of outpayments.

New funds received in 1944 totaled \$8,206,702. The most sizable additions were reported by The New York Community Trust, \$4,650,638; the California Community Foundation (Los Angeles), \$723,398; the Chicago Community Trust, \$675,000; the Hartford Foundation for Public Giving, \$500,000; and the Dallas Community Trust, \$389,808.

Three new community trusts were created in 1944—in Columbus, Ohio; Spartanburg, S.C.; and Champaign, Ill.

RALPH HAYES,

The New York Community Trust.

COMPULSORY MILITARY TRAINING. See **EDUCATION, REVIEW OF.**

CONDON, John F., American teacher who figured as intermediary in the Lindbergh kidnapping case: b. New York, N.Y., 1860; d. there, Jan. 2, 1945. As "Jafsie," Dr. Condon delivered the \$50,000 ransom in the Lindbergh kidnapping case.

Educated in the Bronx, Dr. Condon received his B.A. from the City College of New York in 1882. He taught in the New York public schools, later became professor of education at the College of New Rochelle, and eventually lectured at Fordham University. On March 7, 1932, he wrote the assistant editor of the Bronx *Home News*, offering to act as negotiator between the Lindbergh family and the kidnapers and to add \$1,000 to the \$50,000 reward previously posted by Colonel Lindbergh. It was in these classified "ads" that Dr. Condon first used the name "Jafsie," based on his three initials. On March 9, he received an answer from the kidnapers accepting the offer. Then followed the series of messages between him and the mysterious "John," and their eventual meeting in April at St. Raymond's Cemetery in the Bronx. When the kidnapper broke his promise to return the baby, Dr. Condon described him to the police in great detail. After the baby's body was found, he made every attempt to solve the crime at his own expense. His identification of Bruno Richard Hauptmann as the man to whom he had given the ransom money was an important factor in the state's case against Hauptmann.

CONGO, Belgian. See **BELGIAN CONGO.**

CONGREGATIONAL CHRISTIAN CHURCHES IN THE UNITED STATES. The. These churches reported as of Sept. 1, 1945 a total membership of 1,113,930, a net gain of more than 20,000 in the year. The number of accessions was 70,928

which is the largest number of accessions to the churches in many years. It is a significant fact that during war years, since the time of the Revolution down to the First World War, the churches suffered greatly in losses of members. But in the Second World War the churches made the largest gain of many years. The denomination reports 5,875 churches, a decrease of 16 in the year; 32 new churches were organized and 48 merged or closed, the trend is towards fewer but larger churches. As might be expected with so many young persons in national service or other war work, the church schools show a decrease in membership, with a total of 489,677, a loss of 14,556 a small decline considering the times.

The list of ministers totals 5,675, of whom 3,075 are pastors and 545 are in the chaplaincy or similar work. The withdrawal of this large number of ministers from the pastorate for the chaplaincy has not crippled the churches, for they have gone forward under the leadership of ministers recalled from other forms of service and from retirement for the emergency. The result is that the number of vacant churches shows an increase of only 46 for the nation. The figure for 1944 was 676 while in the First World War the number of vacant churches was 1,424, more than double what it is now.

In finances the churches have shown similar gains. For benevolences, the total for the year was \$3,350,919, an increase of \$436,608, while the amount contributed for home expenses was \$17,467,525, an increase of \$1,255,057. Pastor's salaries have been lifted above the amount of the preceding year by \$100 per pastor.

The state conferences received an increase of \$795,482 and hold investments of \$4,337,697. The city societies income of \$336,432, and funds of \$2,559,588. The American Board of Commissioners for Foreign Missions, receipts of \$1,145,756, and funds totaling \$7,874,183. The Board of Home Missions, income of \$1,436,673, and funds totaling \$25,023,176. The pension boards income of \$1,011,112, of which amount \$407,168 came from the Unit Plan and reserve contributions and funds totaling \$10,794,197. The Council for Social Action, income of \$64,229. The General Council, income of \$86,037, and funds of \$68,374. The Committee for War Victims and Reconstruction raised \$160,000, for denominational societies and \$226,187 for nondenominational purposes, a total of \$386,187.

The officers of the General Council for the present year are, moderator, Ronald Bridges, Tempe, Ariz.; minister and secretary, Rev. Douglas Horton, 287 Fourth Ave., New York 10, N.Y.; associate secretary, Rev. Frederick L. Fagley, 287 Fourth Ave., New York 10, N.Y.; treasurer, Mr. L. Nelson Nichols, 331 E. 71st St., New York 21, N.Y.; chairman of the executive committee, Rev. Arthur H. Bradford, Providence, R.I.

The next biennial meeting will be held at Grinnell, Iowa, in June 1946.

FREDERICK L. FAGLEY,
Associate Secretary, General Council, Congregational Christian Church.

CONGRESS OF INDUSTRIAL ORGANIZATIONS. See **LABOR CONDITIONS IN THE U. S.**

CONGRESS OF THE UNITED STATES. See under **UNITED STATES.**

CONNECTICUT, New England state, United States; one of the original thirteen states. Population (1940): rural, 551,080; urban, 1,158,162; total, 1,709,242. Land area, 4,899 square miles,

divided into 8 counties. Chief cities, with 1940 populations: Hartford, the capital, 166,267; New Haven, 160,605; Bridgeport, 147,121; Waterbury, 99,314; New Britain, 68,685; Stamford, 47,938.

Chief State Officers, 1945.—Governor, Raymond E. Baldwin; lieutenant governor, Wilbert Snow; secretary of state, Charles J. Prestia; treasurer, William T. Carroll; comptroller, John M. Dowe.

Legislature.—The state's General Assembly (Senate, 36 members; House of Representatives, 272) convenes biennially.

Education.—Public elementary schools (1944-45), 791; teachers, 5,011; average daily pupil attendance, 165,551; average yearly salary of elementary school teachers, \$1,975. Public junior high schools, 36; teachers, 735; average daily student attendance, 17,726; average yearly salary of junior high school teachers, \$2,359. Public senior high schools, 91; teachers, 2,619; average daily student attendance, 60,225; average yearly salary of senior high school teachers, \$2,464. Education in Connecticut is compulsory for all children between the ages of 7 and 16, inclusive. There are 4 state teachers colleges. Total state appropriation for education (1944-45), \$4,375,563.52. State commissioner of education, Alonzo G. Grace.

Finances.—The following statement of Connecticut's finances for the fiscal year 1943-44 is the latest available:

Balance in Treasury, beginning of fiscal year 1943-44	\$ 36,739,411.39
Receipts, 1943-44	126,973,263.51
Total	\$163,712,674.90
Disbursements, 1943-44	128,531,620.17
Balance, beginning of fiscal year 1944-45	\$ 35,181,054.73

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	1,942	2,080	2,226
Oats (1,000 bu.)	142	108	132
Hay:			
Alfalfa (1,000 tons) ..	45	55	68
Clover and timothy (1,000 tons)	218	155	220
Tame (1,000 tons)	403	307	443
Tobacco (1,000 lb.)	20,189	23,368	23,482
Potatoes (1,000 bu.)	2,805	3,408	3,798
Apples (1,000 bu.)	1,364	1,523	533
Peaches (1,000 bu.)	106	129	99
Pears (1,000 bu.)	64	77	51
Grapes (tons)	1,300	900	600

CONSTITUTIONAL LAW. See LAW—Section 4.

CO-OPERATIVE ASSOCIATIONS. See FARM CREDIT ADMINISTRATION; FEDERAL DEPOSIT INSURANCE CORPORATION.

COPPER. With the war a thing of the past, in the future we can look forward to fuller informa-

tion on the copper industry throughout the world. While as yet there has not been a sufficient lapse of time since the cessation of hostilities for more than a small amount of information to emerge from under the cloak of censorship, the difference has already made itself manifest, though as yet there is little detail outside of the Western Hemisphere.

United States.—The peak of war production of copper in the United States was passed in 1943, and the 1944 mine output showed a decline of 11 per cent. The salient features of the industry during the war years are shown in the following table, in thousands of short tons.

Although there were sizeable reductions in the copper recovered from domestic ores in 1944, these were offset by increases in returns from foreign ores, in secondary recovery, and in imports; the net result was that the copper available for use in 1944 did not differ appreciably from the total in 1943.

Data on 1945 operations are available only for the first eight months of the year. The decline which showed in the 1944 total began about mid-year, and output gradually lessened as pressure for war supplies eased off. The total mine output through October 1945 was 651,151 short tons, a reduction of 22 per cent as compared with 829,655 tons in the same months of 1944. The monthly totals have declined in 1945 from 67,707 tons in January to 57,178 tons in July, followed subsequently by slight increases. The indications are that the 1945 total will show about the same drop from 1944 as is indicated by the totals through October, or to slightly above the 1939 level.

Canada.—As in the United States, copper production in Canada started to decline about mid-year of 1944, but at a slower rate. Also, this was not a new development, as the Canadian output had been dropping intermittently since 1940. The 1944 total of 275,057 short tons was only 4 per cent below the 287,595 tons of 1943. Continuing into 1945, the total through October was 205,390 tons, 10 per cent less than in the same months of 1944. In 1944 about 10 per cent of the Canadian output was exported in ore, concentrates and matte, and 50 per cent as metal, leaving 40 per cent for domestic consumption. Total exports in 1944 were 163,222 tons, declining sharply to 107,000 tons in January-October 1945. Due to exports in ore and to low secondary recovery the Canadian smelter and refinery outputs ran less than the mine output, rather than more, as in the United States. The high values of other metals, especially nickel and zinc, associated with such a large percentage of the Canadian ores puts the country in a favorable position to compete for postwar markets.

Mexico.—Copper production has been decreasing since 1942, the mine output being 51,379 metric tons in 1942, 49,774 tons in 1943, and 41,302 tons in 1944, while smelter output was 44,729 tons, 43,013 tons, and 32,974 tons respectively.

	1939	1940	1941	1942	1943	1944
Mine production	728	878	958	1,080	1,091	973
Smelter production	712	909	966	1,088	1,093	1,003
Refinery production ¹	1,010	1,314	1,395	1,415	1,379	1,221
Domestic ores	705	927	975	1,065	1,082	974
Foreign ores	305	386	420	350	297	247
Secondary production	500	532	726	928	1,086	951
From old scrap ¹	287	334	413	427	428	457
From new scrap	213	198	314	501	658	494
Imports ¹	336	491	736	764	717	787
Exports	428	428	159	211	294	237
Available for use ¹	1,205	1,711	2,385	2,395	2,230	2,228

¹Available for use includes refinery output, secondary from old scrap, and imports, less exports; secondary from new scrap is only a turnover of metal and statistically does not alter the total for use.

Chile.—When war supplies of copper in the United States began to catch up with demand in mid-1944, the effect was felt in other countries that were selling heavily in the United States, of which Chile was one of the leaders. This affected production, and mine output declined somewhat from the high levels of 1943 and 1942, being 487,600 metric tons, 509,378 tons, and 489,158 tons respectively. However, as had not previously been the case, smelter output was higher—490,441 tons, 489,320 tons, and 477,733 tons. Practically the entire copper output of Chile has been coming to the United States, and since the decline in nitrate production that has been under way ever since the First World War, copper has been the chief item of export. Consequently the cessation of war demand will have pronounced economic repercussions in the country. Formerly Chile was an outstanding low-cost producer, but during the war costs rose to a point where African copper will fare much better in competition for postwar trade to replace the decreased sales in the United States.

Peru.—Copper production has been declining slowly since 1940, the drop being about one quarter. Mine output in 1944 was 32,390 metric tons, as compared with 33,407 tons in 1943 and 43,965 tons in 1940. As with Canada, some ore is exported, so smelter output in the same years was 26,888 tons, 28,215 tons, and 33,678 tons.

Northern Rhodesia.—Slackening of war demand cut the 1944 production of Northern Rhodesia about 10 per cent below the 251,107 metric tons of smelter output made in 1943. Reductions in British purchases were heavier than those in the United States.

Yugoslavia.—The well known Bor mine and smelter, which had been the chief German source of new copper since mid-1940, was recaptured by Partisan forces in 1944. The planned demolition of the plant was prevented by the rapid advance of the Yugoslav and Russian forces, but sufficient damage was done to require three months to make the necessary repairs before resuming operation.

Other Countries.—From a number of other countries little has been learned beyond bare output figures, chief of which are the following:

	Output	1942	1943	1944
Cuba	Mine	8,916	6,405	6,584
Newfoundland . . .	Mine	5,666	5,669	5,021
Bolivia	Mine	6,376	6,011	6,170
Spain	Smelter	11,590	10,952	10,590
Sweden	Smelter	12,000	13,600	14,500
Turkey	Smelter	8,242	9,715	11,050
South Africa . . .	Smelter	23,877	22,150	22,600
Australia	Mine	24,500	27,200	31,300

G. A. ROUSH,
Editor, *The Mineral Industry*.

CORN. The Department of Agriculture on October 1, estimated the 1945 corn crop of the United States at 3,078,126,000 bushels, as compared with the 1944 crop of 3,228,361,000 bushels, and the 1934-43 ten-year average crop of 2,433,060,000 bushels. As usual, Iowa was the largest producer in 1945 with a crop of 529,296,000 bushels. Illinois was second with 413,345,000 bushels, and Nebraska was third with 265,298,000 bushels.

COST OF LIVING. See INFLATION AND PRICE CONTROL; LABOR CONDITIONS IN THE UNITED STATES—*Prices and Price Controls*.

COSTA RICA. The second smallest Central American republic, lying between Nicaragua and Panama and the Caribbean Sea and the Pacific

Ocean. Its area is 19,238 square miles. Much of the area is mountainous; the most important topographic feature is the *meseta central*, a small highland plateau 3,000 to 4,000 feet in elevation, which is the economic and demographic center of the country. Population was estimated in January, 1945, to be 725,149; three-fourths of it is in the *meseta central*. About 80 per cent is of almost pure Spanish descent, 14 per cent is mestizo, four per cent Negro, and two per cent Indian. Aside from the considerable number of Negroes brought from Jamaica in the latter part of the 19th century, immigration has been slight. Chief cities are San José, the capital (pop., 76,178), Heredia (10,331), Alajuela (9,603), Limón (9,760), Cartago (9,667), Puntarenas (8,265). Costa Rica was, during the entire colonial period, a part of the Spanish captaincy general of Guatemala. Following independence from Spain in 1821, it became a part of the Central American confederation until 1839 and then became an independent republic. Its present constitution dates from 1871, and hence is the second oldest in Latin America, but it has been amended on numerous occasions, including a long series of amendments in 1943 establishing a section of social guarantees. The government is unitary and includes a president popularly elected for a four-year term, a unicameral legislature elected on a population basis, and a judiciary headed by a Supreme Court of Justice. Costa Rica is divided into seven territorial provinces. The president is Teodoro Picado, elected in February 1944.

Religion and Education.—Roman Catholicism is the prevalent form of worship although religious freedom prevails. Costa Rica has closer relations with the Catholic Church than do most other Latin American republics and the constitution states that to be the religion of the state. The country has one archbishop and one bishop.

Education is free and compulsory and under either the control or supervision of the government. Literacy is estimated at 82 per cent, second highest figure for any Latin American republic. The latest education statistics show 761 primary schools with 73,217 pupils, 49 intermediate schools with 7,251 pupils, and one university (National University, organized at San José in 1940) with 820 enrolled. Several normal and other special schools exist. A new school law, published Feb. 21, 1945, considerably tightened compulsory education requirements and reorganized secondary schools. The Department of Education subsequently organized a pre-school division with the aim of establishing a kindergarten in every school; it also emphasized school and home gardens and the development of teacher training by co-operation with the Inter-American Educational Foundation. A National Geographic Institute opened in January 1945, as a center for studies in geography, geodesy, and geophysics.

Communications.—Railway mileage is 408, of which some 67 miles belong to the United Fruit Company. Passenger traffic in the last pre-war year was approximately 800,000. Improved highway mileage is 771, in addition to which there are about 1,000 miles of plantation highways. The major highway project in recent years has been the Pan American Highway, construction of which in southeastern Costa Rica has been very difficult; a tributary road to the Pan American Highway was expected to be completed in 1945. A bond issue authorized August 8, 1945 for 7,000,000 colones (colón = 18 cents) included

3,000,000 for highway construction. Daily international air service operates. Pan American Airways in August 1945, proposed a new local airline to compete with TACA (Transportes Aéreos de Centro América). Vehicle registration in 1943 was 2,372 passenger cars, 350 busses, and 1,265 trucks. Costa Rica has 435 post offices, 295 telegraph offices employing 1,916 miles of line, and approximately 2,560 telephones. There were in 1943 a total of 24 broadcasting stations and about 25,000 receiving sets.

Production.—Costa Rica is primarily agricultural. The chief crops are coffee, bananas, and cacao; corn, beans, rice, sugar, potatoes, and fruits are subsistence crops. The Department of Agriculture in 1945 continued its work on soil analysis, erosion, mechanization of sugar growing, etc. A National Production Council was established by decree of Feb. 5, 1945, to stimulate agricultural production. The 1945 cacao crop was estimated at 110,000 bags of 150 pounds. Coffee production in the 1945–46 season was estimated at 369,074 bags of 60 kilograms (kilogram = 2.2046 pounds) as against 444,667 bags in the 1944–45 season. The 1944–45 cotton crop was estimated at 102,500 pounds of lint cotton. Plantation rubber and abacá have recently been grown under United States governmental stimulation and oil palms are being planted in increasing acreage. The principal forest products, in addition to rubber, are balsa, cedar, mahogany, and rosewood. The small mineral production involves chiefly gold, but also manganese and salt. Industrial production involves about 3,000 manufacturing establishments but these are almost all small-scale and their output value is not large. They include coffee and cacao processing plants, rice mills, sawmills, sugar mills, shoe factories, edible-oil extraction plants, and cotton textile plants.

Foreign Trade.—Total imports in 1943 were valued at \$20,387,000 (\$28.84 per capita) of which \$10,667,000 came from the United States; total exports in 1943 were \$12,431,000 (\$17.58 per capita) of which \$8,895,000 went to the United States. Costa Rica's basic coffee quota, according to the Inter-American Coffee Agreement, is 200,000 bags of 60 kilos. This was increased for the 1944–45 season to 281,946 bags. The final quota in the 1943–44 season was 263,644 bags, with shipments to the United States of 239,192 bags. Total exports during the crop year 1943–44 (October 1 through September 30) were 304,447 bags. Banana shipments in the first quarter of 1945 were 532,747 stems, an increase of 24 per cent over the same period in 1944. Easing of the shipping situation has facilitated export of bananas. Costa Rica's principal imports normally include metal products, railway materials, machinery, wheat flour, chemicals, petroleum products, and motor vehicles; shortages of supply have of course seriously interfered with those imports in recent years.

Finances and Economic Conditions.—Costa Rica's budgetary position has declined from 1939 to the present. Expenditures for 1944 were C67,017,945 and revenues C52,827,108. Budget proposals for the fiscal and calendar year 1945, as presented to Congress March 15, 1945, were estimated expenditures of C64,961,943 and anticipated revenues of C65,000,000. Expenditures in 1944 were heavily in excess of revenues and the same situation continued in the early months of 1945, with the result that some governmental wage and salary items were several weeks in arrears. Customs receipts, ordinarily a leading item of revenue,

were seriously threatened by shortages of imports. The public debt March 31, 1945, was C231,681,569, including C147,885,120 external and C83,796,449 internal debt. Several bills were pending before the congress early in 1945 looking to reform of Costa Rica's fiscal and tax system. They would, if adopted, it was felt, make easier a settlement with holders of the country's external debt. A law approved August 14 reorganized the bureau of the budget, the general accounting office, and the treasury department. A bond issue authorized August 8 included C4,000,000 for governmental expenses. The circulating medium increased during the war years from C56,247,929 to C155,590,043. One result was that the cost-of-living index, which was 100 in 1936, was 108 by 1939, 189 at the beginning of 1945, and 193 in April. Governmental inability to control rising prices led to an unstable economic situation early in 1945. An office of economic defense was created March 28, 1945 to attempt to regulate prices, export quotas, and rationing. Shortages of staple foods were serious early in 1945. The government insurance monopoly announced Feb. 28, 1945, that C316,752,886.39 of insurance was in force as against C266,146,739 one year earlier.

Principal Events.—A tense political situation prevailed at the beginning of 1945 because of New Year's riots which President Picado charged were due to followers of ex-President León Cortés, although the latter denied anything but peaceful opposition to the administration. War Minister Rene Picado, brother of the president, resigned January 15 and the president announced he would fill the post himself. President Picado's decision to prevent ousting of Vanguardia Popular (formerly the Communist party) members from government positions as demanded by Conservatives was believed responsible for the cabinet change. Nevertheless, relations between the government and the Vanguardia Popular, which previously had given strong support, were strained at times in 1945. Ex-President Cortés told the press June 11 that he would not be a candidate for president in 1948 or participate in 1948 congressional elections because he had "no confidence in free election promises given by the Picado regime." Sessions of congress opened January 8 and May 1. Among important pieces of legislation considered were bills to tighten the naturalization laws (as recommended by the Committee for Political Defense at Montevideo), and restriction of commercial activity to Costa Rican nationals. The government on June 15 put into effect a new treaty of amity with China. On June 28 the government presented a deed of gift to U.S. Ambassador Hallett Johnson for land for a new embassy building. Ricardo Jiménez Oreamuno, 85, three times president, died Jan. 4, 1945.

RUSSELL H. FITZGIBBON,
Department of Political Science, University of California, Los Angeles.

COTTON. According to the Department of Agriculture's October 1 estimate, the 1945 cotton crop of the United States amounted to only 9,779,000 bales of 500 pounds each as compared with the 1944 crop of 12,230,000 bales, and the 1934–43 ten-year average crop of 12,293,000 bales. This 20 per cent decline in production was attributed by the Agriculture Department to a 12 per cent decrease in acreage and a 11 per cent smaller yield. Texas, as has been true for a number of years, was the leading cotton producing state with an output in 1945 of

2,000,000 bales, a decline of 1,112,000 bales from the average crop of 3,112,000 bales picked in the period 1934-43. Mississippi was second in production with 1,670,000 bales in 1945; 1,937,000 bales in 1944; and an average of 1,677,000 bales in 1934-43. Arkansas was the third largest producer with 1,300,000 bales in 1945; 1,394,000 bales in 1944; and an average of 1,322,000 bales in 1934-43.

World Supply.—The world supply of cotton in 1944 was placed at 50,604,000 bales, of which 25,800,000 bales represented the carry-over from 1943, and 24,804,000 bales the new production. World mill consumption of cotton in 1944 was placed at 23,876,000 bales. The world carry-over in 1945 was estimated at 26,560,000 bales. World production and consumption figures for 1945 were not available.

Exports.—Exports of cotton from the United States in 1944 totaled 2,006,737 bales, including some cotton exported by the army. The United Kingdom took 643,116 bales; Spain, 257,778 bales; while 508,801 bales went to France. The latter figure, however, includes the exports by the army.

Consumption, United States.—The United States consumed 9,575,829 bales of cotton in the 1944-45 cotton year.

Prices.—The average price of cotton in the United States in September 1945, based on reports from 10 markets, was 22.50 cents per pound for Middling 1½-inch staple. By December 6, however, the price had risen to an average of 24.38 cents a pound.

COUNCIL OF FOREIGN MINISTERS. See **WORLD POLITICS.**

CRABTREE, James William, American educator: b. Crabtree, Scioto County, Ohio, April 18, 1864; d. Washington, D.C., June 9, 1945. From 1917-35 Dr. Crabtree served as secretary of the National Education Association, during which period the membership grew from 7,300 to more than 200,000. He spent three years, from 1935-38, as acting general secretary of the World Federation of Education Associations, and was secretary of former President Hoover's advisory committee on education (1931-32). Dr. Crabtree was graduated from the Peru (Nebr.) State Normal School (1887), and received his B.S. degree from Bloomfield Scientific Institute (1890), and his B.A. and M.A. degrees from the University of Nebraska in 1908. He was superintendent of schools at Ashland, Nebr. (1889-95); state high school inspector for the University of Nebraska (1897-1904); president of Peru State Normal School (1904-10); Nebraska state superintendent of public instruction (1910-11); and president of River Falls (Wis.) State Teachers College (1911-17). Dr. Crabtree was the author of *Roll of Honor Word Book* (1899); *The Crabtree Speller* (1908); *The Canvasser and His Victims*; and an autobiography, *What Counted Most*.

CRAIG, Malin, United States Army officer: b. St. Joseph, Mo., Aug. 5, 1875; d. Washington, D.C., July 25, 1945. A distinguished soldier in the First World War, Gen. Malin Craig was chief of staff of the United States Army from October 1935 until his retirement in August 1939, during which time the army was modernized and greatly increased in strength and efficiency.

Graduating from West Point in 1898, General Craig fought in the Spanish American War

with the 4th Cavalry. In 1900 he participated in the China Relief Expedition and then served in the Philippines (1900-01; 1907-09). He was graduated from the Infantry-Cavalry School in 1904, the Army Staff College in 1905, and the Army War College in 1910. On duty with the General Staff Corps in Washington, D.C., when the United States entered the First World War, he was promoted lieutenant colonel, transferred to the Field Artillery, and assisted in the organization of the 41st Division, of which he became chief of staff. He went overseas in the fall of 1917 and in January of the next year was detailed as chief of staff of the 1st Corps, in which capacity he helped map the strategy for operations at Champagne-Marne, Aisne-Marne, St. Mihiel, and Meuse-Argonne. After the armistice, he became chief of staff of the American forces at Coblenz, Germany, until 1919, when he was appointed director of the General Staff College in Washington, D.C. He was, at various times, as he rose to brigadier and then to major general, commandant of the Cavalry School at Fort Riley, Kansas (1921-23); in command of the coast artillery defenses of Manila and Subic Bay in the Philippines (1923-24); chief of cavalry of the War Department (1925); and assistant chief of staff (1926). He commanded the 4th Corps Area (1927); the Panama Canal Division and Department (1927-30); the 9th Corps Area (1930-35); and the Fourth Army (1933-35). Just prior to his appointment as chief of staff (Oct. 2, 1935-Aug. 31, 1939)—a position which carried with it promotion to full general—he served as commandant of the Army War College in Washington, D.C. General Craig emerged from retirement (1939) in September 1941 to head the secretary of war's personnel board, which passed on the issuance of commissions to civilians. He had received the Distinguished Service Medal and the Croix de Guerre with two palms and was a commander of the Legion of Honor and a Companion of the Bath.

CRANBERRIES. The 1945 cranberry crop of the United States was estimated by the Department of Agriculture at 634,100 barrels on October 1. This figure compares with the 1944 crop of but 369,700 barrels, and the 1934-43 ten-year average crop of 631,660 barrels. Of the 1945 crop, Massachusetts was credited with producing 470,000 barrels, Wisconsin with 70,000 barrels, and New Jersey with 45,000 barrels. In 1934-43 Massachusetts produced an average crop of 423,400 barrels; Wisconsin, 91,400 barrels, and New Jersey, 88,400 barrels.

CRAVEN, Frank, American actor and playwright: b. Boston, 1880?; d. Beverly Hills, Calif., Sept. 1, 1945. One of the beloved figures of the American theater and motion pictures, Frank Craven had been called "the best pipe and pants-pocket actor in the business." The son of John T. Craven, a prominent comedian of the preceding generation, Frank Craven made his first stage appearance as a child, at his mother's side, in *The Silver King*. He was 16 years old when he began playing in repertory in Philadelphia, Boston, Cleveland, and Detroit. New York theatergoers first knew him when he appeared in 1907 as Walter Marshall in *Artie*, but it was not until 1910 when he played James Gilley in *Bought and Paid For* that he achieved his first outstanding success. In 1914 he wrote *Too Many Cooks* and *This Way Out*, both of which enjoyed long runs in New York and on the road. For the producer, John Golden, he wrote such

successful plays as *The First Year*, *Spite Corner*, *New Brooms*, *The Nineteenth Hole*, *Salt Water*, and *That's Gratitude*. His last Broadway appearance was in Zoë Akin's comedy, *Mrs. January and Mr. Ex*, which opened at the Belasco Theater on March 31, 1944. Previously he had scored a success as the stage manager who served as the commentator in Thornton Wilder's Pulitzer prize-winning play, *Our Town*, which opened Feb. 4, 1938, and ran for 331 performances. Mr. Craven played the same role in the screen version. His recent motion picture appearances included *Dangerous Blondes*, *Jack London*, *Son of Dracula*, *The Suspect*, and *Colonel Effingham*.

CRET, Paul Philippe, American architect: b. Lyon, France, Oct. 23, 1876; d. Philadelphia, Sept. 8, 1945. One of America's most distinguished architects in the classicist tradition, Dr. Cret designed the Folger Shakespeare Library and the Federal Reserve Building in Washington, D.C., the Detroit Institute of Arts, the Delaware River Bridge in Philadelphia, the United States Memorial at Chateau-Thierry, and other notable structures. After attending the Lycée de Bourg and the École des Beaux Arts in Lyon, Dr. Cret studied at the École des Beaux Arts in Paris, where he was graduated in 1903. Coming to the United States that same year, he was appointed assistant professor of architectural design at the University of Pennsylvania, where he taught until 1937. During the First World War, he served in the French Army and then after 1917 with the French mission attached to the 1st Division of the American Expeditionary Forces. In 1940 the late President Franklin D. Roosevelt appointed him to the Federal Fine Arts Commission, in charge of consideration and approval of plans for public buildings. Dr. Cret had also been consulting architect to the American Battle Monuments Commission, a member of the architectural commission of the Chicago World's Fair in 1933, consultant to the board of design of the New York World's Fair in 1939, consultant for the United States Army Engineer Office in Pittsburgh, and since 1938 a consultant to the United States Navy Department.

CRETE (CANDIA). An island in the Mediterranean, situated at the entrance to the Aegean Sea. It is approximately 160 miles long, and from 7 to 35 miles wide, containing 3,235 square miles with a population (1938) of 441,687. The capital is Canea (pop. 26,604), and the chief city and center of trade is Candia (33,404).

Formerly under the rule of the Romans, Byzantines, Saracens, Venetians and Turks, its union with Greece was recognized by the other Balkan States by the Treaty of Bucharest in August 1913. On Oct. 31, 1940, British military forces landed on the island and proceeded to fortify it with air bases, forts, and heavy gun emplacements. On May 20, 1941, Germany invaded the island by sea and air, the brunt of the invasion being carried by an estimated 10,000 to 12,000 parachute troops which gradually overcame the Allied defenders when German control of the air had been won. German positions on the island were bombed by the Allies a number of times in 1943, and the air attacks were intensified in 1944. Allied forces landed in October 1944, and the invaders retired to the western end of the island. A tacit truce lasted until the armistice of May 8, 1945; but the surrender of 10,500 Germans to 500 British troops was not completed until May 26, in order to protect the invaders from massacre by the civilians.

Besides murdering many inhabitants, the Germans completely destroyed 40 villages, rendering 68,195 inhabitants destitute.

CREWE, MARQUESS OF (ROBERT OFFLEY ASHBURTON CREWE-MILNES), English statesman and diplomat: b. London, England, Jan. 12, 1858; d. Leatherhead, Surrey, England, June 20, 1945. Leader of the Liberal Party in the House of Lords until 1944, when he resigned because of ill health and advancing years, Lord Crewe had a long and distinguished political and diplomatic career.

After attending Harrow, and Trinity College, Cambridge University, Lord Crewe in 1883 became assistant private secretary to Lord Granville, at that time secretary for foreign affairs; lord in waiting to Queen Victoria in 1886; and lord lieutenant of Ireland from 1892 to 1895. He served as lord president of the council (1905-08; 1915-16); secretary of state for the colonies (1908-10); lord privy seal (1908; 1912-15); and secretary of state for India (1910-15). Lord Crewe was British ambassador in Paris (1922-28), and secretary of state for war in 1931. He was created a marquess in 1911. Lord Crewe was an elder brother of Trinity House, chancellor of Sheffield University, and the holder of honorary degrees from Oxford and Cambridge. He published two books: *Stray Verses* (1889-90), and *Lord Rosebery* (1931).

CRIME AND PRISONS. There was a slight rise in adult crime in the United States during 1945. Some officials claimed that this represented a "crime wave." To buttress their contention, they cited certain figures. It was said, for instance, that "serious crimes had increased 19 per cent in October of 1945 over the same month of 1944."

This comparison is unfair. In 1944, we were at war. Millions of men were in the armed services and the adult crime rate was low. It rose, naturally, in 1945, when many of these men returned to civilian life. Interestingly enough, though, there is little difference between the crime rate of that year and that of 1940, when it was never contended that we had a "crime wave." But whether there will be one in the future—a question many people are now asking—depends upon two important factors:

(1) Will there be jobs for those who want to work? During depressions, thousands of unemployed, who under normal conditions would never steal, do so because of economic necessity.

(2) Will the rise in juvenile delinquency—which began soon after Pearl Harbor—be stemmed, and steps taken to remould young lawbreakers, the potential adult criminals? In many areas during the past few years, schools were closed due to a shortage of teachers; in others there was an utter lack of recreational facilities. Child labor laws were flagrantly violated so that thousands of youngsters were thrown into fields and factories instead of continuing their studies.

Equally alarming were reports which showed that children were neglected because their mothers engaged in war industries. However, with the termination of hostilities and a subsequent reduction in the number of female war workers, this will no longer be a vexing problem. Furthermore, some communities are now taking steps to combat delinquency by increasing recreational facilities, opening youth centers, and establishing crime prevention bureaus. And

in San Francisco, a school for parents of delinquents was set up. Those parents were taught how to understand their children and how to help them. This project was described as "highly successful" by local authorities.

On July 8, 1945, Robert P. Patterson, then under secretary of war, issued a report concerning offenses by American soldiers against civil or military law. The number of such offenses was very low.

In 1944, only about 18,000 soldiers were convicted by general courts-martial. And in 1945 only 33,519 were in confinement in the United States or overseas. This, the report points out, represents the total number from the ten million men who have joined the army since the Selective Service Act was passed in 1940. It also includes a few still serving under sentences prior to 1940.

Of the 4,182,261 American soldiers who served in the European theater of operations from January 1942 until June 1, 1945, only 10,289, or less than one in 400, were sentenced to confinement by general courts-martial.

Every attempt is made to rehabilitate all army prisoners. Minor offenders who receive sentences of six months or less are placed in post guardhouses. Prisoners convicted by general courts-martial, with sentences over six months, are placed in any one of three types of institutions: (1) rehabilitation center, (2) disciplinary barracks, (3) federal penitentiary or reformatory. The aim of the army's prison program is "to restore to honorable status in the Army all prisoners, who give evidence of their fitness for further service, and to provide, for those to be discharged because of unfitness, a program of educational vocational training which will help them to meet their obligations as citizens."

Due to a shortage of vital materials, no new buildings were erected in any prisons in 1945. However, all federal prisons and, with few exceptions, state prisons have aided in the war effort. Inmates purchased war bonds, gave blood to Red Cross banks, volunteered to act as "guinea pigs" to the cause of science, and manufactured millions of dollars worth of matériel for the armed services.

With the termination of the war, the matter of penal industries is occupying the profound attention of wardens and other officials. Idleness in prisons, rampant before Pearl Harbor, had a deteriorating effect upon inmates. During the war, when they were allowed to engage in useful endeavors, their morale increased. Therefore, penal industries are being continued in most of the states that previously had none. Furthermore, some prison farms are being enlarged. This will mean jobs for a number of inmates—a vital necessity for their rehabilitation.

LEWIS E. LAWES,

Former Warden, Sing Sing Prison.

CRIMINAL LAW. See LAW—Section 5.

CRIPPS, Sir (Richard) Stafford, British political leader: b. April 24, 1889. Professionally a brilliant and able lawyer, politically the stormy petrel of the British Labour Party, Sir Stafford Cripps was appointed president of the Board of Trade in the Attlee Cabinet on July 27, 1945, after Labour's sweeping victory in the first general election held in Great Britain since 1935. Sir Stafford figured prominently in world news in the spring of 1942, when he headed a British mission to India, in an unsuccessful effort to ne-

gotiate settlement of the differences between Great Britain and India's political factions. From February-November 1942, he was a member of the Churchill War Cabinet, leader of the House of Commons, and lord privy seal; he was relieved of these offices in the latter month, and appointed minister of aircraft production. A member of Parliament since 1931, Sir Stafford was expelled from the Labour Party in 1939 for organizing a popular front movement. He then cast his lot with Churchill, and when the latter became prime minister, was appointed ambassador to Russia. He is author of three books: *Why this Socialism?* (1934), *The Struggle for Peace* (1936), and *Democracy Up-to-date* (1938). In 1941, Eric Estorick published his biography of Sir Stafford—*Stafford Cripps: Prophetic Rebel*.

CROP INSURANCE. See FEDERAL CROP INSURANCE CORPORATION.

CROW, (Herbert) Carl, American journalist and author: b. Highland, Mo., Sept. 26, 1883; d. New York City, June 8, 1945. After several years work as a journalist in the United States, Mr. Crow went to China in 1911 and soon became associate city editor of the *China Press* in Shanghai; in 1913 he went to Tokyo as business manager and later as acting editor of the *Japan Advertiser*, also serving as Tokyo correspondent of the United Press. He returned to the United States in 1914, but during the First World War, went back to China as Far Eastern representative of the Committee on Public Information (1916-18). After the armistice he founded and edited the *Shanghai Evening Post*, and became the proprietor of an advertising agency in that city (1919-37). He returned to the United States in 1937, revisited China in 1938, and spent the autumn of 1940 in South America. He served as special assistant to the director of the Office of War Information from 1941 to 1943.

Among Mr. Crow's books are *Travelers' Handbook for China* (1912); *America and the Philippines* (1913); *Japan and America* (1915); *Four Hundred Million Customers* (1937); *Master Kung and I Speak for the Chinese* (both 1938); *He Opened the Door of Japan* (1939); *Meet the South Americans* (1941); and *China Takes Her Place* (1944).

CROWN, James Evans, American newspaperman: b. Catlett, Fauquier County, Va., Aug. 11, 1873; d. New Orleans, La., Jan. 10, 1945. A member of the staff of the *New Orleans States* since 1916, Mr. Crown was known for his newspaper crusading on behalf of "clean government." He was called "Major" Crown by the late Senator Huey P. Long, whom he helped into office and whose regime he later helped to crush. Purchased in 1933 by the *Times-Picayune*, the *New Orleans States* published in the spring of 1939 a story exposing the Louisiana scandals which broke the Long machine, directed since his death by Governor Richard W. Leche and others. Mr. Crown's editorials were influential in helping elect Governor Sam Jones' reform ticket.

CUBA. With an area of 44,164 square miles, including island possessions, and a population (official census, 1943) of 4,778,583, Cuba is about 780 miles long, averages 59 to 60 miles wide, and is the most strategically and commercially important West Indian republic. Havana, the capital (population, 1943 census, 676,376, including rural *municipios*), is the govern-

mental center for 6 provinces, which include 7 cities of more than 75,000 population. Approximately 73 per cent of the people are white, mainly of Spanish descent, and the remainder are of Negro or of mixed blood. An excellent climate (80° F. average in summer, 70° F. in winter), extremely fertile lands, valuable forest reserves, and rich mineral resources constitute the natural wealth of Cuba. Sixty per cent of the land is flat to gently rolling, and 40 per cent is rugged hilly to mountainous, about half suited to cultivation. Most of the mountains are in the east in the Province of Oriente, the Sierra Maestra range rising 7,872 feet. Discovered by Columbus (Oct. 28, 1492), Cuba was under Spanish control (except for 1762-63 British occupancy) until the Spanish American War brought separation in 1898. The United States influenced Cuban affairs through intervention under the Platt Amendment until May 29, 1934, when the amendment was abrogated by treaty, leaving Cuba completely independent.

Government and Politics.—Cuba's new constitution, effective Oct. 10, 1940, included broad social guarantees and individual rights, extended women's suffrage, and established a semi-parliamentary government. Organization was based upon a unitary system with popular election of the president, vice president, and members of the Senate and House of Representatives, but although the constitution accepted the principle of separation of powers, it also made the premier and the President's Council of Ministers responsible to Congress through interpellation and vote of censure. In May 1942 the first official interpellation took place, but the method of parliamentary government has not greatly increased congressional control over the executive.

Dr. Grau San Martín, elected to the presidency on June 1, 1944, began his administration with considerable popular support. During 1945, however, he faced developing opposition. His own political party—Partido Revolucionario Cubano (Auténtico)—criticized his cabinet, advisers, and army appointments. Some groups resented his accepting Communist support, and others blamed him for shortages of food, the black market, and wartime restrictions. President Grau silenced some criticism, however, by earmarking \$50,000,000 for public works. In mid-March the government broke up a plot headed by ex-Colonel José E. Pedraza to kill the president. Of the 41 suspected plotters seized by the government, 14 were released on April 6. Pedraza and 5 others were sentenced to one year of imprisonment. On April 24 Enrique Enríquez, chief of the Secret Service of the Presidential Palace, was assassinated by terrorists. The suspected revolutionists, however, were released from custody early in June. The domestic political scene was disturbed throughout the year by conjectures as to whether former-President Batista would return to Cuba and re-enter the political arena. Throughout the year Cuba continued a policy of international co-operation. By the second quarter of 1945, Cuba had contributed 20,000 tons of sugar to UNRRA.

Agriculture and Industry.—The severest drought in 86 years was mainly responsible for a sugar crop 30 per cent smaller than 1944. Rains broke the eight-month drought on June 21, but early figures for the year's sugar crop indicated only 3,924,000 short tons of raw sugar and 195,000,000 gallons of blackstrap molasses. In June, the Commodity Credit Corporation offered to purchase the 1946 sugar crop at 3.45 cents per

pound raw sugar F.O.B. Cuban ports, the blackstrap molasses prices to be the same as those of 1945. Cuban sugar interests, however, deferred until more definite knowledge of the size of the 1946 sugar crop could be obtained. The drought retarded the 1946 crop by two months. Manuel Casanova, president of the Cuban Sugar Institute, openly sought an assured sugar market in the United States, declaring that Cuba wanted a guaranteed annual quota. The drought reduced the tobacco, corn, rice, and peanut crops below those of 1944. Producing only about 50,000,000 pounds of milled rice, from October 1944 through May 1945 Cuba received 263,400,000 pounds of rice from the United States and about 47,700,000 pounds from Ecuador and Chile. Coffee production was down so low the government prohibited further exportation. Henequen fiber was reduced 25 per cent. In the first 4 months of 1945, an estimated 745,000 bunches of Johnson or Gros Michel bananas were exported as compared with 666,000 for the corresponding period in 1944. Drought and disease (sigatoka), however, reduced the size and quality of Cuban bananas. The dry weather lowered milk production for the first half of 1945 to only about two-thirds of the output for the corresponding period in 1944. The total output of condensed and evaporated milk for the first quarter of 1945 dropped to 71,350 cases, a decline of 35 per cent from 1944. The 600,000 pounds of butter produced during the first 5 months compared unfavorably with the total of 2,600,000 pounds for the 12 months of 1944. The pineapple crop, however, equaled the 1944 crop of 2,482,000 crates, with about 73,500,000 pounds for export.

Alcohol production for the first 5 months was 26,150,000 as compared with 21,299,839 gallons in the same period in 1944. Cuba produced 3,790 tires in June. The cost of living rose exceptionally in the second quarter of 1945. Retail food price indexes of the Ministry of Agriculture increased from 166 for Havana and 180 for the 30 city average in mid-March to 189 and 200 respectively toward the end of June. A price spiral and food shortages led to labor problems. One three-day strike involved 10,000 agricultural, industrial and railroad workers. Salaries and wages for the first 4 months of 1945 were about \$122,000,000 as compared with slightly under \$100,000,000 for the comparable 1944 period. Merchandise sales for the first 2 months were \$215,370,000 as against \$175,496,000 a year previous.

Commerce.—Exports for the first 4 months showed substantial increase over 1944. Export and import figures for the January-April period were \$251,793,000 as compared with \$205,580,000 earlier—\$179,559,000 exports and \$72,234,000 imports as against \$138,823,000 and \$66,757,000 in 1944.

Transportation.—Cuba was the host for the first International Air Transport Operators Conference. Legislation was passed creating a civil aeronautics authority, and important refinancing by the Expreso Aéreo Inter-Americana was concluded. The latter company applied for a permit to establish a New York-Havana express and passenger service. Regular night flights between Havana and Miami were inaugurated by Pan American Airways on June 27. British and Swedish general cargo ships resumed service. The earnings of the railroads through the first 5 months declined from \$16,857,517 in the 1944 period to \$15,778,993 in 1945.

Finance.—Budget collections for the period Jan. 1–July 23, 1945 reached the all-time high of 85,228,143 pesos, an increase of 11,913,885 pesos compared with the equivalent period in 1944. This was remarkable because 19 taxes were either abolished or reduced in October 1944. The United States Treasury renewed its stabilization agreement with Cuba for 4 years beyond June 30, 1945, agreeing to sell gold to Cuba on 120 days' credit provided the outstanding overdraft was not in excess of \$5,000,000 at any one time. Under a decree in June, Cuba was permitted to purchase an additional \$50,000,000 in gold bullion, which will give the country \$200,000,000 in earmarked gold in the United States.

WILLIAM S. STOKES,
Department of Political Science, Northwestern
University.

CURACAO, kōō-rä-sä'ō. One of two "Overseas Territories" of the Kingdom of the Netherlands (the other being Surinam), consisting of two groups of islands in the West Indies about 500 miles apart. The first three islands named in the following list comprise the group lying off the Venezuelan coast; the remaining three are in the Leeward Islands east of Puerto Rico:

	Square Miles	Population July 1, 1943
Curacao	172.5	73,839
Aruba	69.9	36,064
Bonaire	111.9	5,725
St. Martin ¹	13.2	2,337
St. Eustatius	11.8	1,229
Saba	4.8	1,018
	384.1	120,212

¹ The southern part only belongs to the Netherlands; the northern part belongs to France.

Curacao became the property of the Netherlands in 1634 as the result of the defeat of Spain, and it has remained a Dutch possession ever since except for a few years during the Napoleonic era, when it was in the possession of England. It is administered by a governor assisted by a council composed of a vice president and three members nominated by the queen of the Netherlands. The legislative assembly of Curacao is called "Staten" and consists of 15 members—10 elected by the voters and 5 nominated by the governor. Willemstad (pop. Dec. 31, 1942, 33,062) on Curacao, is the seat of government. The other islands are administered by officials called *gezaghebbers*, nominated by the governor. A greater degree of postwar autonomy was indicated in December.

Dutch is the official language of the colony, though Spanish and English are also spoken. Furthermore a native language called Papiamentu has evolved. The religion of the majority is Roman Catholic.

Finances.—Revenue is derived from import, export and excise duties, taxes on income, land, etc. The budget for 1944 estimated revenues at 24,954,000 guilders and expenditures at 24,942,000 guilders.

Production.—The chief products of the territory are refined oil, straw hats, salt and phosphate of lime. The chief industry is oil refining. The refineries located on Curacao and Aruba are subsidiaries of Royal Dutch Shell and the Standard Oil Company of New Jersey. Canadian mining interests in 1945 received a concession from the government for exploitation of gold deposits on Aruba, which have been mined for about 120 years, but it is Aruba's petroleum refinery, the largest in the world, that has enabled

the local population to attain the highest standard of living in the Caribbean area. Crude petroleum refined on Curacao and Aruba amounted to 139,619,000 barrels in 1944. Other products include maize, cattle, pulse, beans, sugar, and cacao.

Transportation.—Public transportation, which had been extremely unsatisfactory, was improved somewhat in 1944 and 1945 by the establishment of a regular bus service on the islands of Curacao and Aruba. KLM (Royal Dutch Air Lines) and Pan American Airways continue to operate regularly in and out of the islands, and in 1944 the New York-Curacao service of the Royal Netherlands Steamship Lines was resumed. Shipping between Aruba and North and South American ports has increased. In 1941 a total of 10,178 ships called at Curacao and Aruba.

Foreign Trade.—Exports from Curacao and the other islands in the group in 1943 were valued at 298,000,000 guilders and imports at 345,000,000 guilders. The export trade is made up largely of petroleum and petroleum products. Exports of the latter from Aruba in the first quarter of 1945 were 8 per cent higher than in the corresponding quarter of 1944, while the total petroleum exports of 1944 increased 32 per cent over the exports during the previous year. Curacao's imports are made up largely of foods, clothing, furniture, and other household commodities. It also imports rather large quantities of tobacco and tobacco products. In 1943 imports of tobacco totaled 10,014,700 cigars, 1,310,485,000 cigarettes and 66,132 kilograms of other tobacco manufactures.

CURTIN, John, Australian statesman: b. Creswick, Victoria, Australia, Jan. 8, 1885; d. Canberra, Australia, July 5, 1945. Prime minister of Australia since October 1941, John Curtin led the commonwealth through days of threatening Japanese invasion and, with Gen. Douglas MacArthur, supreme commander of Allied forces in the Southwest Pacific, converted the continent into the greatest Allied base of operations during the early years of the Pacific war.

After attending state schools, Curtin worked in turn at a printing shop, a pottery works, and a canister factory. In his early twenties, he developed an interest in the Australian Labour Party, which first became a political factor in 1904. He was secretary of the Victoria branch of the Timber Workers' Union from 1911 to 1915; editor of the *Westralian Worker*, the official Labour organ for Western Australia, from 1917 to 1928; and represented Australian workers at the League's International Labour Conference in 1924. He served in the House of Representatives of the federal parliament from 1928 to 1931, and from 1934 to 1941. Elected Labour Party leader in October 1935, he automatically became leader of the Opposition in Parliament. He also was a member of the Commonwealth's Royal Commission on Family Allowances (1927–28); of the Joint Committee on Public Works (1929–31); state advocate for the government of Western Australia to the Commonwealth Grants Commission (1933–35); and since October 1940 a member of the Australian Advisory War Council.

Curtin became prime minister and minister of defense co-ordination in October 1941 after the defeat in the House of Representatives of the coalition government of Australia's two conservative parties, the United Australia Party and the Country Party. Shortly after Pearl Harbor,

he announced that Australia placed her chief reliance in the United States and that she refused to regard the war in the Pacific as a side issue to the European war. He began at once to put the country on a drastic wartime basis and to increase war production. Curtin's close friendship and co-operation with General MacArthur, who arrived in Australia in March 1942, was of greatest value to the Allied war effort in the South Pacific. In June 1943 Curtin won a non-confidence vote in the House by a majority of one, after criticism of his domestic policies. He then called for a general election which gave him a majority in Parliament unprecedented in the history of the Labour Party. In April 1944 he conferred in Washington with the late President Roosevelt on war and postwar problems in the Pacific, and early the following month, he attended the London Conference of Dominion Prime Ministers.

CYPRUS. An island colony of Great Britain, situated at the eastern end of the Mediterranean, about 40 miles off the mainland of Asia Minor. From southwest to northeast, it is about 148 miles long; its width varies from 40 to 15 miles. The area is 3,572 square miles, and the population in 1943 was estimated at 393,249, most of the people are Greeks, the remainder comprising chiefly Turks, Maronites, and Armenians. Nicosia (pop. 29,399) is the capital, and the principal ports are Limassol (17,630), Larnaca (14,220), and Famagusta (13,331). Administered by Great Britain since 1878, Cyprus was annexed in 1914 and became a colony in 1925. The governor (Sir Charles Campbell Woolley appointed Sept. 20, 1941) is assisted by an Executive Council of seven members (two of them unofficials) and an Advisory Council composed of the members of the Executive Council together with five Christian and two Moslem representatives of the community. The 1945 budget estimated revenue of £2,770,000 and normal expenditure of £2,000,000, plus expenditure of £1,800,000 for war purposes. Most of the inhabitants are members of the Independent Cypriote Church, a self-governing body in communion with the Orthodox Eastern Church; a considerable minority are Moslems, and other religious communities are Maronites, Armenians, and Anglicans. A separate educational system exists for each religion, and while elementary schools are under government control, there is an advisory board for each religion. In 1943-44 there were 687 elementary schools with an enrolment of 53,293 pupils; secondary schools numbered 28. The chief agricultural products are wheat, barley, oats, vetches, olives, carobs, potatoes, and onions. Vineyards are extensive, and cotton is also cultivated. There are large numbers of goats on the island, and lesser quantities of cattle, sheep, donkeys, horses, and mules. Gold and copper have been mined since ancient times, and other minerals of economic importance are asbestos, chrome iron, gypsum, and terra umbra. Cyprus silk is considered to be the finest in the Middle East; the government has been encouraging the planting of mulberry trees with the object of doubling the silk output. Wines and olive oil are produced, and during the war pottery making was developed. Soap making has expanded to the point where the island is now completely independent of imports, and industries newly established in wartime include the manufacture of plywood, cotton spinning, and woollens and agriculture implement manufacture. Exports in 1943 were valued at £2,187,067, and

imports at £2,592,389, the latter including foodstuffs, textiles, and petroleum products. Port facilities are poor, owing to the lack of natural harbors. There are 886 miles of all-weather highways, and 1,716 miles of feeder roads. A railroad from Famagusta runs by way of Nicosia to Kalokhorio, a distance of 71 miles. The island is on the route of British air transport services.

CYRENAICA. See LIBYA.

CZECHOSLOVAKIA. The origin of the Czechoslovak Republic was due to the First World War. The Czechoslovak Declaration of Independence was proclaimed in Washington, D.C., on Oct. 18, 1918, by the founder of Czechoslovakia, Dr. Thomas G. Masaryk (má'sa-rik'). The Czech National Council seized power in Prague on Oct. 28, 1918 on the basis of the Washington Declaration and the temporary Czech government was formed in Paris on October 14 and recognized by the Allies. The representatives of the new states, including the Slovaks, formed the Revolutionary Assembly which, on Nov. 14, 1918, deposed the Hapsburgs, proclaimed a republic, elected Masaryk president, and set up a Cabinet with Karel Kramář (kra'märsh) as premier and Dr. Eduard Beneš (q.v.) as foreign minister. The new state was composed of Bohemia, Moravia, Silesia, Slovakia and Carpathian Ruthenia (Russia). The republic's two decades of independence were characterized by prosperous progress and democratic practices. But Hitler decided in May 1938 to dispose of the Czechoslovak problem in his own way. Thus, while professing allegiance to his country, Konrad Henlein, head of the Sudeten-deutsche Partei (later, Reichskommissar for the Sudeten areas after German occupation in October 1938), was taking orders from Hitler, whose demands grew bolder as the spring and summer of 1938 progressed. The more concessions granted by President Beneš, under pressure from London and Paris, the more blatant the Sudeten Nazis became. The crisis was not settled, however, until Germany had dispatched a large army to the Czechoslovak frontier, and Mussolini, appearing in an unusual role as peace-maker, persuaded Hitler to agree to a four-power conference at Munich on September 29. At this momentous gathering, attended by Hitler, Mussolini, Daladier, and Chamberlain, it was decided to yield the Sudetenland to Germany. The Czechoslovaks were not even consulted. The State of Czechoslovakia was rendered defenseless and the German "Drang nach Osten" became a reality.

The Munich surrender of September 29 and the Vienna award of Nov. 13, 1938 hacked from Czechoslovakia 14,656 square miles, reducing her area from 54,245 sq. mi. to 39,589 sq. mi. and her population from 14,729,536 to 9,983,536.

The final blow fell on March 14, 1939, when Germany took the country and called President Hácha, the successor to President Beneš, to Berlin, to sign away Czechoslovakia's independence. German troops entered Prague even before Hácha returned home. Hitler declared Bohemia-Moravia a protectorate. The Slovak Parliament refused on March 14 to vote the separation from the Czechs but the Nazi threats forced it to proclaim the independence of the country. The creation of a separate Slovak state separated the Ruthenians from the Czechs, and the provincial government had to proclaim its independence also; but after 24 hours of independence, Hungarian troops invaded the territory and on March 16 Premier Teleki announced the incorporation of Ruthenia in Hungary. On March 8, 1939 Hit-

ler signed a treaty with Tiso at Vienna, legalizing German military occupation of Slovakia and undertaking to "protect" it also. Special political status was reserved for the small German minority of about 100,000 and a German undersecretary of state was created. In August 1939 the development of the Polish-German crisis brought an announcement that "owing to the existing situation" German forces had taken military possession of the state. The fiction of the independence of Bohemia-Moravia and Slovakia was continued, but gradually given up. The protector's office, a vast and complex apparatus with 16 divisions, became, in fact, the exclusive source of legislative and administrative power of the Protectorate. A policy of denationalization was put into effect by sending the Czech workers to the Reich and their children to German schools; the property of the Czechs and Jews began to be confiscated and expropriated by devious means. Germans from the Baltic States were resettled around Prague, breaking up Czech compact settlements. Slovakia's fictitious independence was expressed in a new Slovak Constitution of July 1939, describing the country as a Christian National Republic and permitting the existence of only one party, Hlinka's former autonomists. As Bohemia-Moravia was more and more deprived of liberties, property and cultural possessions, terrorism and sabotage ran rife and thousands of Czechs were executed. Some 30,000, from Cabinet ministers to private soldiers and students, escaped abroad; after the defeat of Poland, some 10,000 Czechoslovaks fought in France, and others joined the Allies' armies in Britain and the Near East, and Yugoslavia's partisans. On May 27, 1942 a bomb was tossed into the automobile carrying Reinhard Heydrich, deputy Gestapo chief known as "Heydrich the Hangman," and in revenge, the Germans exterminated the little village of Lidice and its inhabitants. Meanwhile, former President Beneš had started organizing another revolutionary movement (as in the First World War) in America and England. On Aug. 5, 1942, the British government declared that it no longer considered itself bound by the terms of the Munich agreement; on October 28, Washington recognized Dr. Beneš as president of the Czechoslovak Republic, and the Czechoslovak government in London as an Allied government possessing full authority. Beneš' basic program was the recreation of the pre-Munich Czechoslovakia. Final recognition to the Beneš government-in-exile was extended by President Roosevelt's telegram on Oct. 28, 1942. In May and June of 1943 Beneš paid an official visit to the United States, addressing both Houses of Congress.

A new treaty of friendship, mutual assistance and postwar co-operation was concluded between Czechoslovakia and the Soviet Union on Dec. 12, 1943 (supplementing the Czechoslovak-Soviet agreement of July 18, 1941).

In 1944 underground and open resistance against the Nazis was steadily growing. Allied bombers attacked Plzeň and seven great oil refineries in the brown-coal region of northwestern Bohemia; the great Apollo Refinery in Bratislava was bombed three times. The Beskid mountains in eastern Moravia became the hideout of strong armed units which blew up main railway lines at intervals, burned German army food stores and stole arms from small German garrisons. Armed units of Slovaks also carried on sabotage work. The Slovak division in Pescary, mutinied after hearing General Alexander's appeal to Italian

Partisans when the grand offensive was launched below Rome. There were mass desertions of Slovak soldiers of the 1st Slovak Infantry Division to the Red Army during the battle of Melitopol. On Aug. 12, 1944, the Slovak puppet government had to proclaim martial law throughout Slovakia after patriots had clashed with German troops retreating from Poland through the Carpathian passes and had attacked German military transport and supply dumps; a day later, František Němec, Czechoslovak Minister of Reconstruction, and Gen. Rudolf Viest, were appointed to go to Moscow as the delegates of the Czechoslovak government for the administration of liberated Czechoslovak territories. (The Red Army had reached the frontiers of Czechoslovakia on April 8.) The London and Moscow exhortations to the Slovak people to organize national committees and partisan groups led to an armed uprising at the end of August; officers of the Czechoslovak Army had been dropped by parachute to take command and kept in constant touch with London by secret radio. On August 29 the German High Command ordered the military occupation of all Slovakia. Fighting weapons were delivered by air to the partisans. On September 8 the State Department announced that the United States had notified the German government that the Czechoslovak forces fighting on the territory of the republic were a regular army of the United Nations and military conventions were to be observed in the treatment of prisoners and wounded. On August 29 the garrison at Baňská Bystrica proclaimed its allegiance to the Czechoslovak Republic. Under the shock of the widespread uprisings, Vodka (Führer) Tiso accepted, on September 5, the resignation of Béla Tuka as prime minister, and appointed his brother, Dr. Stefan Tiso, a former judge, as premier and minister of foreign affairs and justice. The First Czechoslovak Army Corps, formed in Russia, fought its way through the Dukla Pass in the Carpathian Mountains from Poland and captured Višň Komárnik, the first town in Czechoslovakia to be freed from German rule, on October 6. The revolt which the Slovaks started in their mountainous country at the end of August, received help from outside. Two squadrons of British-trained Czechoslovak fighter pilots dropped into partisan-held air fields. Eight thousand Czechoslovak Army men parachuted in from Russian-based planes. Some supplies were flown in from Italy. But the two Russian armies, one in the Carpathian passes in the north and the other south in Hungary, bogged down, and the First Czechoslovak Army, which had won Allied recognition and belligerent status under the able 54-year-old Gen. Rudolf Viest, were defeated after two months by seven German divisions. General Viest and his chief of staff, Brig. Gen. Karol Golian, were captured.

Principal Events, 1945.—While the anti-Nazi uprising suffered a temporary setback as the Germans had occupied two central Slovak bastions of the insurgents, Baňská Bystrica and Zvoleň, Užhorod, Ruthenia's capital, fell to the Soviet army on October 27, on the eve of Czechoslovak Independence Day; František Němec, the Czech government delegate, went from London to take charge of the province. By the end of December numerous towns had been liberated in Eastern Slovakia, and National Committees, similar to the one in Užhorod, were elected. UNRRA began sending medical supplies to the liberated areas. While Russia had formerly agreed to respect Czechoslovakia's pre-Munich frontiers, she

indicated in January a desire to join Ruthenia with the Soviet Ukraine. When the Czechoslovak government recognized the Lublin Committee installed in Warsaw as the provisional government of Poland, the London Polish government broke off diplomatic relations with the Beneš government on February 1. Beneš and his Cabinet arrived in Moscow on March 17, on the way to Košice and eventually to Prague. On April 7, the new Czechoslovak government, headed by Premier Zdeněk Fierlinger, former minister to Russia, with Jan Masaryk as minister of foreign affairs, was appointed and pledged to maintain "practical" military, political, economic and cultural relations with Russia; six Communists were included in the Cabinet. On May 5, the London government appealed by broadcast to the citizens of Prague to join the patriots and fight the enemy; Partisan broadcasts from Prague appealed for Allied aid. While all the rest of Europe was beginning to celebrate V-E Day, Prague suddenly turned itself into one big shooting gallery. As things turned out, Prague was liberated, not by the Allies, who did not arrive until the shooting was all over, but by 22,000 Russian outlaws wearing German uniforms under Gen. Vlasov; the German resistance ended four days later. On May 15, the prime minister announced that the people of Ruthenia had formed an autonomous government,

which had expressed the desire to join the Soviet Union; a day later President Beneš arrived in Prague. On June 29, an agreement was signed in Moscow transferring Ruthenia to the U.S.S.R. When Prague was opened again to the Czechoslovak government, Dr. Beneš announced that all Nazi Germans must leave. But when Prague began the expulsion, with Moscow's approval, London stepped in and demanded a postponement. Then Prague started exchanging 300,000 Slovaks in Hungary for 500,000 Magyars in Czechoslovakia. Meanwhile, Prague had seized more than 270,000 farms, comprising about 6,250,000 acres, chiefly in the Sudetenland, owned by Germans, Hungarians or "traitors and collaborationists" generally. In July, the Russians started moving out of Czechoslovakia. Beneš was a more popular figure than ever. Under the decree of August 24, every able-bodied citizen had to take part in reconstruction; labor brigades were recruited to be sent to colonize "economic vacuums" in border regions and into the mines. The 22d U.S. Army Corps in Plzeň (better known to Americans as Pilsen), supplied army trucks with drivers to help in the harvesting of the crops and storing of the grain.

JOSEPH S. ROUCEK,
Professor of Political Science and Sociology, Hofstra College.

D

DABNEY, Charles William, American educator: b. Hampden-Sydney, Va., June 19, 1855; d. Asheville, N.C., June 15, 1945. Dr. Dabney was president of the University of Cincinnati from 1904 to 1920, during which time it developed from a small institution to one of the best known American municipal universities. Dr. Dabney received his B.A. degree from Hampden-Sydney College in 1873, and studied at the University of Virginia from 1874 to 1877. He was professor of chemistry at Emory and Henry College for a year, and then spent two years studying in Berlin and Göttingen, receiving his Ph.D. degree from the University of Göttingen in 1880. He became professor of chemistry at the University of North Carolina (1880-81), and state chemist and director of the North Carolina Agricultural Experiment Station (1880-87). He served as director of the Tennessee Agricultural Experiment Station (1887-90), and as president of the University of Tennessee (1887-1904). During the years 1893-97 he was also assistant secretary of agriculture in the administration of President Cleveland. In 1921, the year after he retired from the University of Cincinnati, he organized a firm of geologists and engineers in Houston, Texas. Four years later he began preparation of the two-volume work, *Universal Education in the South*, published in 1936.

DAGO, dä'gù (HIUMAA, hē'ōmā) ISLAND. This island, situated to the southwest of the entrance of the Gulf of Finland and north of the island of Ösel, in the Baltic Sea, originally belonged to Denmark, but was acquired by Sweden in 1645, and was held by Russia from 1721 to 1919, when it became a possession of Estonia. It has a normal population of about 16,000, the in-

habitants including many Swedes. Its fisheries are productive, but the soil is poor for agricultural pursuits. The Soviet-Estonian mutual-assistance pact, signed on Sept. 28, 1939, permitted the location of Soviet naval bases and aerodromes and 25,000 Soviet troops on the islands of Dagö and Ösel (q.v.) and at the mainland port of Paldiski (Baltiski). In October 1941, however, the island of Dagö was occupied by the Germans, after several days of severe fighting, and remained for nearly three years thereafter part of the system by which the Germans and the Finns maintained their blockade of the Gulf of Finland. By the end of September 1944, Finland's break with Germany and the reconquest by the Soviet armies of the Estonian mainland had cleared the way for the expulsion of the Germans from Dagö and Ösel. Dagö was captured by Red Army forces on Oct. 1-2, 1944. See also ESTONIA.

DALADIER, Edouard, French political leader: b. Carpentras, France, June 18, 1884. M. Daladier was premier of France at the outbreak of the Second World War on Sept. 3, 1939. With Britain's late prime minister, Neville Chamberlain, he presided at the "peace" of Munich. The collapse of France in the war with Germany led to his downfall on March 20, 1940. There followed a brief period as minister of defense and war in the Reynaud Cabinet until May 20, when he became foreign minister; he resigned this post on June 6. On November 17, 1940, he was

arrested by the Vichy government and imprisoned. At the Riom war-guilt trials (February 1942), Daladier, with Leon Blum, led the attack on Marshal Pétain; these hearings were dropped in April 1942, and Daladier was placed under house arrest at Vals les Bains, but a short time later, was removed to Bourrasol Castle, near Vichy. On April 5, 1943, it was announced from Berlin that he had been claimed by the German government and taken to a German prison to prevent "establishment of a counter-government" under Allied auspices. On May 5, 1945, he was freed from political imprisonment in Itter Castle, Austria, by American troops.

After his return to France in 1945, he testified at the Pétain trial. He was honorary president of the Radical Socialist Party at the party congress held in August.

DALTON, Hugh, British Cabinet member: b. Neath, Glamorganshire, South Wales, 1887. Mr. Dalton was appointed chancellor of the exchequer in the Attlee Cabinet in late July 1945. He had previously been president of the board of trade in Winston Churchill's coalition government. Fifty-nine-year-old Hugh Dalton was educated at Eton; King's College, Cambridge; and the London School of Economics. After the First World War (in which he served on the French and Italian fronts), he was Sir Ernest Cassel Reader in Commerce at the University of London, 1920-25; later in economics, 1925-36. He was parliamentary undersecretary in the Foreign Office, 1929-31, and from 1936-37, chairman of the National Executive of the Labour Party. He served as minister of economic warfare, 1940-42, becoming president of the board of trade in the latter year. He is author of *Inequality of Incomes in Modern Communities*; *With British Guns in Italy*; *Principles of Public Finance*; *The Peace of Nations*; *Practical Socialism for Britain*; and *Hitler's War*.

DAMS. President Truman presided and spoke Oct. 10, 1945, at the formal dedication of the finished Kentucky Dam on the Tennessee River at Gilbertsville, 22.4 miles above the junction of this river with the Ohio. This is the last and largest unit of the system of dams which will give a 9-foot navigation channel from the Ohio to Knoxville, Tenn. The dam is 8,650 feet long, 206 feet high and backs up a pool more than 180 miles long. One purpose of this dam of importance, in view of the destructive floods in the Lower Mississippi Valley in recent years, is that it can stop the flow of the Tennessee River for several days, and reduce the flood stage at Cairo as much as two feet. Together with other dams above this the flood stage may be reduced as much as 4 feet.

On this occasion the president announced that the time had now come to start on the greater flood control plans for the great tributaries of the Mississippi, namely the Missouri, the Arkansas, the White and other rivers to the west. In this connection the flood control of the Ohio has already been planned for, and the money for it is included in the billion dollar appropriation passed by Congress at the end of 1944. Dams for navigation purposes are already built in the Ohio, but there remains a number of reservoirs yet to be created in the upper tributaries to hold back floodwaters. See also **TENNESSEE VALLEY AUTHORITY**.

Missouri Valley Project.—The creation of a Missouri Valley Authority has been agitated and planned for several years. On Nov. 28, 1944,

the late President Roosevelt asked Congress to authorize a basic engineering plan for the Missouri River Basin, to be developed and supervised by a Missouri Valley Authority, but no construction to begin until six months after the end of the war. The plan to be along the lines of the joint proposal of the Bureau of Reclamation and the Corps of United States Engineers which had previously met at Omaha, Neb., to prepare a report on the same. On December 23 a bill was passed by Congress and signed by Mr. Roosevelt appropriating \$1,000,000,000 for flood control with the provision that \$400,000,000 should apply to financing the Missouri Valley Authority project.

The Missouri Valley project will include irrigation as well as flood control, navigation and power development, as the middle course of the Missouri passes through hundreds of miles east of the Rockies which are deficient in rainfall. Reclamation through irrigation comes under the jurisdiction of the Bureau of Reclamation. The Corps of Engineers is chiefly concerned with navigation and flood control, but both must make allowances for the use of water for generating power for industries and rural electrification. At the Omaha conference an agreement was reached setting forth three main points on which they concurred as to jurisdiction and objectives.

(1) The Corps of Engineers should have the responsibility for determining main stem reservoir capacities and capacities of tributaries for flood control and navigation.

(2) The Bureau of Reclamation should have the responsibility for determining the reservoir capacities on the main stem and tributaries of the Missouri for irrigation and probable future extension of irrigation, and the amount of stream depletion due to irrigation.

(3) Both agencies recognize the importance of the fullest development of hydroelectric power consistent with other beneficial uses of the water.

They also adopted a series of six subdivisions set forth originally in the plan of the Bureau of Reclamation as submitted to the Senate in recording the changes made in the various areas. These comprise: (1) Upper Missouri River Basin, (2) Yellowstone River Basin, (3) Missouri River—Fort Peck to Sioux City, (4) minor western tributaries, (5) Niobrara, Platte and Kansas rivers, (6) lower Missouri Basin.

Lackawack Dam, Delaware River.—The New York Water Supply Board received bids in September 1945, for the completion of the Lackawack Dam on the headwaters of the Delaware River. These bids were rejected as being too high, and new bids were re-advertised for. This dam is to form the chief reservoir for the new water supply system of New York City. Work on most of this system including other dams and the great aqueduct has been completed and in use to a limited extent. The original contract for this dam when work was started in 1939 was at the figure of \$15,486,000. The work was stopped during the war due to shortage of material and labor when about half done, and it was estimated that \$8,000,000 would finish it at the original contract scale of prices. However the lowest bid in September 1945 was \$13,919,950.

James River Project.—The Virginia State Planning Board in August 1945, sent out a prospectus of the proposed development of the James River Basin. This was worked out in collaboration with the United States Engineering Corps. They asked for approval and opinions of governing bodies, civic and other public organiza-

tions, etc. This is to be a long range project covering several decades. The announced purpose is for flood control of the James River, navigation and the sale of electric power from hydroelectric developments. There will be 14 dams, one of which is finished. Four of the dams are for flood control. The total capacities of reservoirs will be 4,400,000 acre-feet, of which about 20 per cent will be reserve capacity for flood control. The highest dams are located in the valleys of the headwater tributaries, and range in height from 135 to 248 feet. The dams in the lower reaches of the river range from 60 to 84 feet. It is pointed out that full sale of power will depend upon the early finishing of the upper dams to furnish reservoir capacity for an even all year flow of water. It is estimated that 159,000 acres will eventually be bought, of which 52,000 acres are cleared. Much of the acreage is in the uplands and of less agricultural importance.

Anderson Ranch Dam.—In Idaho work was resumed in the fall of 1945 on the Anderson Ranch Dam on the South Fork of Boise River; estimated to be finished in 1947 or early 1948. The spillway height will be 339 feet, and the ultimate reservoir capacity will be 500,000 acre-feet.

Uruguayan Project.—In Uruguay a most important project to that country is being pushed to completion. This is the Rincon de Bonete Dam on the Rio Negro for flood control, hydroelectric development and navigation control. The dam is near the center of the country, about 145 miles from Montevideo which will be the chief user of current generated. There will be a 7-foot channel for navigation to the Uruguay River 245 miles distant. The dam will be all concrete except 305 feet of earth fill with concrete core at the east end. Maximum height of dam is 137.4 feet, length 3,846 feet, with a reservoir 93 miles long. Ultimate capacity will be 128,000 kva (kilovolt-ampere). When completed the project will about double the electric supply of the country. Uruguay has no coal and timber for fuel, and has depended upon the United States for fuel oil and coal. During the height of the German submarine campaign wheat and corn were used for fuel in Montevideo powerhouses, and for fuel otherwise. The project is a government monopoly for generating and distributing current. The project was started in 1937 by a German syndicate and Buenos Aires contractors, and was about 90 per cent complete when the war began, but lacked generators and equipment. In 1942 United States engineers took over and manufacturers here were allowed to furnish one generating unit and line equipment to Montevideo. The completion of 4 units will care for 70 per cent of the fuel consumption of Montevideo.

Brazilian Project.—In Brazil it is planned to develop the San Francisco River along the lines of TVA. The first hydroelectric plant is planned to be at Paulo Alfonso Falls, 265 feet high, and 145 miles from the river's mouth. \$20,000,000 capital is required, one half furnished by the national government. It is expected to begin generating current in five years with an initial capacity of 110,000 kw (kilowatt). The ultimate capacity will be 440,000 kw. See also RECLAMATION.

E. C. McDOWELL,
Consulting Engineer, New York.

DANCE, The. Despite innumerable wartime difficulties, there was an enormous amount of activity in all fields of the dance during the 1944–

45 season. Large cross sections of the public new to the dance were being won over to this form of entertainment by the touring ballet companies which enjoyed unprecedented popularity. The so-called modern dance displayed renewed vigor, with an unusually large number of recitals and a constantly growing audience. All types of dancers performed for the entertainment of men in the armed services, at the fighting fronts, in camps, canteens, and hospitals, and several groups were organized within the services by dancers in uniform. The Foxhole Ballet, first ballet unit sponsored by the USO, made a six months' tour of Italy, France, Belgium, and Germany, and was enthusiastically received by American troops wherever it appeared.

Leading dancers were in great demand both in the professional theater and motion pictures. Almost every new Broadway musical boasted a dance attraction and many incorporated full-fledged ballets by noted choreographers from the ballet and modern dance fields. For a time during 1944, the Ballet Russe de Monte Carlo itself was featured in the dances George Balanchine staged for *Song of Norway*. Alicia Markova and Anton Dolin danced to an original score, *Scènes de Ballet*, by Igor Stravinsky, in *The Seven Lively Arts*. Jerome Robbins choreographed a complete ballet, *Interplay*, for inclusion in *Concert Varieties*. Other Broadway shows employing serious choreographers were *Bloomer Girl* and *Carousel* (de Mille); *La Vie Parisienne* (Massine); *Hollywood Pinafore* (Tudor); *Rhapsody* (Lichine); *On the Town* (Robbins); *The Firebrand of Florence* (Littlefield); *Sadie Thompson* (Caton); *Sing Out, Sweet Land* (Humphrey-Weidman); *Up in Central Park* (Tamiris); *Dark of the Moon* (Junger); and *Blue Holiday* (Dunham). Helen Tamiris and Daniel Negrin toured as featured dancers in *People's Bandwagon*, a revue designed to entertain rallies to re-elect President Roosevelt. Among recent motion pictures in which prominent dancers appeared are *A Song for Miss Julie* (Markova and Dolin); *Tonight and Every Night* (Marc Platt); *Make Mine Music* (Lichine and Riabouchinska); and *Night and Day* (Mladova and Zoritch). Agnes de Mille went to England to direct dances for the film *London Town*.

Starting in September, New York enjoyed an almost uninterrupted ballet season of four months, with the Ballet Russe de Monte Carlo, the Ballet Theater, and the Ballet International, a new company, succeeding each other. The Ballet International, founded in May 1944, made its first appearance in an eight-week season under the sponsorship of the Ballet Institute, a nonprofit educational organization. The initial cost of setting up this company, estimated at \$250,000, was underwritten solely by George de Cuevas, founder and artistic director, and his wife, the former Margaret Strong, granddaughter of the late John D. Rockefeller. With the intention of giving New York a resident ballet, the Park Theater was leased for 10 years, redecorated, and renamed the International. The company consisted of some 50 dancers, headed by Viola Essen, Marie-Jeanne, André Eglevsky, and William Dollar. Seven world premieres were offered: Bronislava Nijinska's *Brahms Variations*, decor by Marcel Vertès; Nijinska's setting of Mussorgsky's *Pictures at an Exhibition*, decor by Boris Aronson; Léonide Massine's *Mad Tristan*, music by Wagner, scenario, sets, and costumes by Salvador Dali; Simon Semenov's *Memories*, based on a story by Winthrop Palmer, staged to Brahms

waltzes, decor by Raoul Pené du Bois; Edward Caton's *Sebastian*, music by Gian-Carlo Menotti, sets by Oliver Smith, costumes by Milena; Antonia Cobos' *The Mute Wife*, after Anatole France's *The Man Who Married a Dumb Wife*, music by Paganini arranged by Vittorio Rieti, decor by Rico Lebrun; and Eglevsky's *Sentimental Colloquy*, inspired by Verlaine's poem, music by Paul Bowles, decor by Dali. In addition to *Les Sylphides* and *Swan Lake*, there were three other revivals: Nijinska's setting of Ravel's *Bohéro* (first created for Ida Rubinstein in 1928), sets by Enrico Donati; Dollar's *Constantia* (first performed by the American Ballet in 1936, when it was called *Concerto*) to Chopin's F Minor Piano Concerto, sets by Horace Armistead, costumes by Grace Houston; and Boris Romanoff's *Prince Goudal's Festival* (first staged some 20 years ago for Romanoff's Romantic Theater in Berlin), music from Anton Rubinstein's *The Demon*, decor by Mstislav Dobujinsky. None of these ballets proved to be a complete artistic or commercial success, although *Constantia* and *Pictures at an Exhibition* showed considerable accomplishment, and *Sebastian* and *The Mute Wife* had moments of effectiveness. What the Ballet International chiefly needed was a clearly defined artistic policy and strong experienced leadership. The company also suffered from a weak second-line of soloists (despite the excellent dancing of Francisco Moncion and John Guelis), an inadequately trained corps de ballet, and a repertory lacking in distinction and balance. On the credit side were excellent new scores by Bowles and Menotti, and a capable orchestra. David Lichine, Tatiana Riabouchinska, Irina Baronova, and George Zoritch later joined the company, but the troupe was finally disbanded in March 1945.

The Ballet Russe de Monte Carlo staged a triumphant come back during the 1944-45 season. This success was largely due to the efforts of George Balanchine, who, though he held no official title, drilled the company, gave it four of his best ballets to dance, and generally raised the artistic standing of the organization to a high level. One of the finest new ballets of the season was his setting of Stravinsky's *Dances Concertantes*, a brilliantly animated divertissement, with sumptuous sets and costumes by Eugène Berman. In addition, he created a new *Pas de Deux* to entracte music from Tchaikovsky's *Sleeping Beauty*; presented revised versions of *Le Bourgeois Gentilhomme* (first produced by the René Blum and Colonel de Basil Ballets Russes de Monte Carlo in 1932), after Molière's comedy, music by Richard Strauss, decor by Berman, and Tchaikovsky's *Mozartiana* (created for Les Ballets 1933), sets by Berman, costumes by Christian Bérard; and revived *Ballet Imperial* (first presented by the American Ballet on its South American tour in 1941), to Tchaikovsky's G Major Piano Concerto, decor by Dobujinsky. During the spring season, two Balanchine festival evenings were given in celebration of his 25th anniversary as a choreographer. Another revival by this company was Ruth Page's and Bentley Stone's *Frankie and Johnny* (first done for the WPA Federal Theater in Chicago in 1938), music by Jerome Moross, sets by Clive Rickabaugh, costumes by Paul Dupont.

Of the five new offerings by the Ballet Theater, the most outstanding was Antony Tudor's "psychological murder ballet," *Undertow*, to a highly dramatic score by William Schuman, with decor by Raymond Breinin. Other premieres by this company included Balanchine's *Waltz Acad-*

emy, music by Rieti, sets by Oliver Smith, costumes by Alvin Colt; Massine's setting of Beethoven's *Moonlight Sonata*, decor by Sergei Soudeikine; Nijinska's *Harvest Time*, music by Wieniawski, costumes by Enid Gilbert; and Nijinska's *Rendezvous*, a character pas de deux to Rachmaninoff's *Polka by V.R.* Among the revivals were a restaging of Lichine's popular *Graduation Ball* (first given by Colonel de Basil's Ballet Russe in Australia in 1939), and Anatole Oboukhoff's versions of the grand pas de deux from Petipa's *Don Quixote*, and from the third act of *Swan Lake* (called *The Black Swan*). Guest stars appearing with the Ballet Theater were Tamara Toumanova, Lichine, Riabouchinska, Markova, Dolin, Massine, Eglevsky, Robbins, and Argentinita. In April, Lucia Chase and Oliver Smith were made administrative directors of this company.

During the summer, Markova and Dolin, assisted by a company of four, and Massine's *Ballet Russe Highlights*, featuring Baronova, Eglevsky, and Yurek Lazowski, were seen in programs of excerpts from ballets and short new numbers at New York's Lewisohn Stadium. Both of these groups are scheduled to tour in 1945-46. Earlier in the season, Mia Slavenska and Marina Svetlova and their ensembles both gave programs of divertissements.

Unquestionably the most important event in the modern dance field was the presentation of three new compositions by Martha Graham, commissioned by the Elizabeth Sprague Coolidge Foundation, to scores, also commissioned, by Darius Milhaud, Aaron Copland, and Paul Hindemith, at the 10th chamber music festival held in the Library of Congress late in October. Of the three works, Milhaud's *Imagined Wings*, utilizing the spoken word, was the least successful, but *Appalachian Spring*, a radiant evocation of early American life, with a score by Copland which won the 1945 Pulitzer Prize in music, and Hindemith's *Hérodiade* (formerly called *Mirror Before Me*), a somber, anguished study of a woman preparing to meet an unknown destiny, must be counted among Miss Graham's very finest achievements. The latter two works were given during the company's brief season in New York, together with Erick Hawkin's *John Brown*, music by Charles Mills, and Merce Cunningham's *Mysterious Adventure*, music by John Cage. This season was such a popular success that Miss Graham and her company have been signed to appear in 1945-46 both in New York and on tour under the management of S. Hurok.

Late in June, Charles Weidman and his new company offered four new works at a series of preview performances in New York: *David and Goliath*, music by Johann Kuhnau, *Dialogue*, to Ernest Bloch's *Concerto Grosso*, and *A House Divided*, music by Lionel Nowak, all three choreographed by Mr. Weidman; and Peter Hamilton's *Three Antique Dances*, to Purcell's music.

During the summer, Hanya Holm presented three group compositions at Colorado College's Fine Arts Conference and Composer's Congress at the Art Center in Colorado Springs: two new works, *Walt Whitman Suite*, to music by Roy Harris, and *The Garden of Eden*, using Milhaud's score for *La Création du Monde*; and *What Dreams May Come*, to music by Alex North, first produced in the summer of 1944.

Many younger artists in the modern dance field gave notable New York recitals during the season. The Dudley-Maslow-Bales Trio, with Frieda Flier replacing Sophie Maslow, offered

three new works: Jane Dudley's solo, *New World A-Comin'*, Dudley-Bales' *Furlough*, and Miss Flier's *Slow Goodbye Blues*. The new trio composed of José Limón, Beatrice Seckler, and Dorothy Bird, under the artistic direction of Doris Humphrey, made an auspicious debut, which included two new compositions by Mr. Limón: *Concerto*, music by Vivaldi, and *Eden Tree*, music by Carl Engel and Mr. Limón, as well as *Three Ballads*, danced by the trio to a suite of folk songs. Pearl Primus and Valerie Bettis and their groups made official Broadway debuts which proved them among the most talented of the younger dancers. Other important recitals were given by Merce Cunningham; Sybil Shearer; and Nina Fonaroff and May O'Donnell, and their groups, in a joint program. The New Dance Group held a successful three-day festival in June, with a roster including the Dudley-Maslow-Bales Trio, Eva Desca, Jane Erdman, Hadassah, Lili Mann, and Pearl Primus.

La Meri and her Natya dancers presented first performances of Rimsky-Korsakov's *Scheherazade* in the Hindu idiom; *Chitra*, a dance play by Tagore; Ravel's *Alborada del Gracioso*; and Debussy's *Ibérica*. Tei Ko made her first New York appearances, and Ragini Devi and her group gave an India dance festival in commemoration of Tagore's birthday. Argentinita, Pilar Lopez, and company, offered a recital at Carnegie Hall. Katherine Dunham's *Tropical Revue* enjoyed a successful three-week Broadway season. The second annual festival of African Dance and Music included Asadata Dafora's new *Festival at Battakor*. Ted Shawn gave a fall recital, and then in April joined with Ruth St. Denis to present Jacob's Pillow Dance Festival's Night of Stars, involving the services of 16 dancers who have appeared at the annual festivals at the organization's headquarters near Lee, Mass.

In England, the Sadler's Wells Ballet, which has mounted 12 new productions since 1940, was widely acclaimed during its ten-weeks' tour of France and Belgium, early in 1945, under the auspices of ENSA (Entertainments National Service Association). Prior to this tour, the company staged Robert Helpmann's powerful new ballet, *Miracle in the Corbals*, to a story by Michael Benthall, with an original score by Arthur Bliss, and decor by Edward Burra. On July 24, 1945, the company returned to its home theater, the Sadler's Wells in London, for the first time since 1940. The Ballet Rambert presented two new works: Andrée Howard's *The Fugitive*, story, sets, and costumes by Hugh Stevenson, music by Leonard Salzedo; and Walter Gore's choreographic translation of Benjamin Britten's *Simple Symphony*, decor by Ronald Wilson. The International Ballet, founded in 1941, has a repertory chiefly made up of the classics, but Angelo Andes' arrangement of *Dances Espagnoles* to music by Spanish composers, with decor by Hein Heckroth, was a new offering. The Ballet Jooss gave one new work: Hans Zullig's *Le Bosquet*, music by Rameau, decor by Doris Zinkeisen. On Jan. 16, 1945, the London Archives of the Dance was established under the chairmanship of Cyril W. Beaumont.

In Paris, during the German occupation, Serge Lifar choreographed 12 new ballets at the Opéra, but after the liberation, he was accused of collaborating with the Nazis and ousted from his post as premier danseur étoile and maitre de ballet. The first production of the new Opéra management was Serge Peretti's *L'Appel de la Route*, to an original score by Arthur Honegger,

with decor by Roger Wild. Reminiscent of the Diaghilev era was the sensational spring appearance of Les Ballets des Champs Elysées, a new company formed by Roland Petit and Boris Kochno. This small group of about a dozen artists presented two new ballets choreographed by Petit: *Les Forains*, story by Kochno, music by Henri Sauguet, decor by Bérard; and *Le Rendezvous*, story by Jacques Pérovert, music by Pierre Kosma, curtain by Picasso, decor by Brassi.

In Rome, the gifted young Hungarian choreographer, Aurel Milloss, maitre de ballet of the Teatro Reale since 1939, staged some 14 of his recent ballets during a three-week season sponsored by the British Army Educational Services. According to report, the most notable were his own versions of Stravinsky's *Petroushka*, Prokofiev's *L'Enfant Prodigue*, Ravel's *Bolero*, and *Caprice*, to Stravinsky's two suites for small orchestra.

Moscow's Bolshoi Theater, traditional home of the classical ballet, celebrated the 50th anniversary of Tchaikovsky's death by presenting *Love of a Snow Maiden*, to a score selected and arranged from his music by Boris Asafiev, and mounted new productions of *Casse-Noisette* and *Swan Lake*. The Stanislavski and Nemirovich-Dantchenko Theater, also in Moscow, specializes in more modern ballets, and recently has given Oransky's *The Merry Wives of Windsor*; *Strausiana*; *Lola*, to music by Vassilenko and several Spanish composers; Asafiev's *Francesca de Rimini*, and a revival of *Scheherazade*. The Leningrad Kirov (formerly Marinsky) Theater of Opera and Ballet, which returned to its home city from Molotov in 1944 after an absence of three years, has presented Aram Khatchaturian's *Gayane* and a Bashkirian ballet, *Song of the Crane*.

The Royal Danish Ballet, with Herald Lander as maitre de ballet, managed to survive the German occupation. Colonel de Basil's Original Ballet Russe continued to play to large audiences in Central and South America, and Igor Schwetsoff was appointed maitre de ballet of the Teatro Municipal in Rio de Janeiro. In Australia, Hélène Kirsova and Edouard Borovansky have both organized ballet troupes, with headquarters in Sydney and Melbourne respectively.

The dance world was saddened by the loss of the great Spanish dancer, Argentinita (q.v.), who died on Sept. 24, 1945. Confirmation has been received of the deaths of Vera Trefilova, former prima ballerina of the St. Petersburg Imperial Theater, in Paris on July 11, 1943, and of René Blum, co-founder of the Ballet Russe de Monte Carlo, in a German concentration camp in April 1944. However, reports that Vaslav Nijinsky had been executed by the Nazis were false; he was found by Russian forces at Sopron, near the Hungarian border, and is now safely living in Vienna.

EDWARD M. STRINGHAM,
Americana Staff.

DANZIG. Baltic seaport and commercial center near the mouth of the Vistula River. Set up, with surrounding territories, in 1920 under the Treaty of Versailles as the Free City of Danzig (with League of Nations protection), it extended between East Prussia on the East, to Pomorze, the Polish corridor province also created by the Versailles Treaty, on the west. The territory of Danzig under the treaty was about 754 square miles in extent, and by the time of the German occupation had a total population of about 415,000, with some 266,000 in Danzig proper.

Dominated by the Nazi Party from 1933 on, Danzig was taken over on Sept. 1, 1939, by Hitler as a part of the German Reich. By a decree of Nov. 1, 1939, it was made the capital of Hitler's new German province of West Prussia.

Important since the middle ages as a port and trading center, in the latter part of the 19th century Danzig underwent further industrialization. The area's industries include shipyards, sawmills, breweries, distilleries, a fertilizer plant, a bolt-and-nut factory, and plants for the manufacture of bricks, furniture, cocoa and cigarettes.

In 1943 Danzig became a target for allied air attacks, American airmen covering a round trip of 1,600 miles from Britain to carry out their missions. During the spring and summer of 1944, Danzig was in the midst of the area of intensive bombing raids and by the end of September was in the path of further bombing attacks from east and west, and of potential Soviet drives through East Prussia and down the Baltic. On March 30, 1945, Russian troops captured Danzig over which they hoisted the Polish flag indicating recognition of Poland's claim. The following day the provisional government at Warsaw announced the province as "an inseparable part of the Polish Republic."

DAVIS, Fay, Anglo-American actress: b. Boston, Mass., 1872; d. Exmouth, Devonshire, England, Feb. 26, 1945. Although born and educated in the United States, Miss Davis (Mrs. Gerald Lawrence) won her greatest triumphs in England, where she went in 1895 to join the company of Sir Charles Wyndham. Her first appearance in *A Squire of Dames* brought her immediate success, and in 1896 she went to the St. James Theater, where she stayed for five years and played her first Shakespearean roles. In 1902, she returned to the United States to appear in *Imprudence*, under the auspices of Charles Frohman. She returned to London several years later and remained there to act in many successful productions. After her appearances in *The Shadow Princess* and *On the Rocks*, she retired from the stage in 1933.

DAWSON OF PENN, Lord, the former BERTRAND DAWSON, English physician: b. 1866?; d. London, England, March 7, 1945. Physician-in-ordinary to King George VI and Queen Mary; Lord Dawson probably attended more royal personages than any other doctor. He became physician-in-ordinary to King Edward VII in 1907, and continued in the same duties to his close friend, King George V, and to King Edward VIII. He also attended many members of the English royal family.

Lord Dawson was educated at University College and London Hospital, and began his career as a general practitioner in Harley Street, London. He was knighted in the coronation honors of 1911, and served through the First World War as major general in charge of the Army Medical Service. In 1920, he was raised to the peerage as a baron, and in 1936, he was made a viscount. Lord Dawson came to the United States in 1930 and visited the Mayo Clinic, Rochester, Minn., Johns Hopkins, Baltimore, Md., and hospitals in Washington, D.C., and New York City. From 1931 to 1938 he served as president of the Royal College of Physicians.

DELAND, Mrs. Margaretta Wade, American author: b. Alleghany, Pa., Feb. 23, 1857; d. Boston, Mass., Jan. 13, 1945. A prolific writer of novels and short stories, Mrs. Deland's first work of fiction, *John Ward, Preacher*, published in 1888, highly shocked her contemporaries because of its unorthodox treatment of religious and social questions. Her other works include *The Old Garden and Other Verses* (1886); *The Story of a Child* (1892); *Old Chester Tales*, popular studies of village life and character (1899); *Dr. Lavendar's People* (1904); *The Awakening of Helena Richie* (1906); *The Iron Woman* (1911); *The Rising Tide* (1916); *The Vehement Flame* (1922); and *Golden Yesterdays*, an autobiography (1941). When Mrs. Deland was elected to the National Institute of Arts and Letters on Nov. 10, 1926, she was one of the first women to be chosen for membership in the institute.

DELATTRE DE TASSIGNY, Jean (Joseph Marie Gabriel), French Army officer: b. Mouilleron-en-Paretz, Vendée, France, Feb. 2, 1889. General Delattre de Tassigny commanded the French divisions which participated in the invasion of southern France (mid-August 1944) as part of General Patch's Seventh Army. At the end of September 1944, his forces, reinforced by other French divisions, and later by one American division, were constituted as the French First Army. The First, with the American Seventh, formed the Sixth Army Group under Gen. Jacob L. Devers. It was to troops of the Sixth Army Group that the famous German Army Group G in Austria surrendered on May 6, 1945. A St. Cyr graduate, Delattre de Tassigny fought in the First World War, and in 1925, took part in the Rif campaign. In the Second World War, he commanded the 14th Infantry Division which distinguished itself in defensive action at Rethel and on the Aisne, May 15–June 11, 1940. In September 1941, he was sent by Vichy to command troops in Tunisia, but his pro-Allied sentiments brought about his recall to France in January 1942, and he was given the 16th Division command at Montpellier. With the North African invasion in November 1942, he tried to organize French resistance to Germany; was arrested and tried by Vichy; and sentenced to 10 years' imprisonment. In September 1943, he escaped Riom prison; reached London by way of the French underground; and in December, joined General de Gaulle in Algiers, where he assisted in the reorganization of French troops in North Africa. Until July 1945, Delattre de Tassigny was the French representative on the Inter-Allied Control Commission in Berlin; in that month, he was appointed inspector-general of the French Army.

DELAWARE. South Atlantic state, United States; one of the original thirteen states. Population (1940): rural, 127,073; urban, 139,432; total, 266,505. Land area, 1,978 square miles, divided into 3 counties. Chief cities, with 1940 populations: Wilmington, 112,504; Dover, the capital, 5,517; Newark, 4,502; New Castle, 4,414.

Chief State Officers, 1945.—Governor, Walter W. Bacon; lieutenant governor, Elbert N. Carvel; secretary of state, William J. Storey; treasurer, Jesse S. Cooper; auditor of accounts, Wilbur E. Jacobs; attorney general, Clair J. Killoran.

Judiciary.—Chancellor of Delaware's Supreme Court, William Watson Harrington; vice chancellor, George Burton Pearson, Jr.; chief justice, Charles S. Richards; associate justices, Frank L. Speakman, for New Castle County; Charles L. Terry, Jr., for Kent County; and James B. Carey, for Sussex County.

Legislature.—Delaware's General Assembly (Senate, 17 members; House of Representatives, 35) meets biennially in odd-numbered years, on the first Tuesday in January.

Education.—Public elementary schools (1944-45), 160; teachers, 830; pupils, 25,853; average yearly salary of elementary school teachers, \$1,765. Public junior and senior high schools (1944-45), 46; teachers, 744; students, 16,233; average yearly salary of junior and senior high school teachers, \$2,060. Teacher training courses are offered at the University of Delaware, Newark, and the State College for Colored Students, Dover; both these institutions receive financial aid from the state. Total state appropriation for education in 1944-45, \$4,350,000. Education is compulsory for children between the ages of 8 and 14, inclusive. State superintendent of public instruction, H. V. Holloway.

Finances.—The following statement of Delaware's finances for the fiscal year 1943-44 is the latest available.

Balance in Treasury, beginning of fiscal year 1943-44	\$ 5,798,098.66
Receipts, 1943-44	13,532,261.20

Total	\$19,330,359.86
Disbursements, 1943-44	10,896,837.81

Balance, beginning of fiscal year 1944-45, \$ 8,433,522.05

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1 estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	Average 1934-43	PRODUCTION	
		Final 1944	Preliminary 1945
Corn (1,000 bu.)	3,956	3,645	4,061
Oats (1,000 bu.)	78	116	128
Wheat (1,000 bu.)	1,348	1,280	1,407
Barley (1,000 bu.)	108	270	352
Rye (1,000 bu.)	117	225	210
Hay:			
Clover and timothy (1,000 tons)	45	38	43
Tame (1,000 tons)	87	96	119
Sweet potatoes (1,000 bu.)	493	465	450
Potatoes (1,000 bu.)	424	273	441
Apples (1,000 bu.)	1,034	870	352
Peaches (1,000 bu.)	365	605	230
Grapes (tons)	1,430	1,200	450

DENMARK. A country of Europe comprising the peninsula of Jutland, the islands of Zealand and Funen, about 500 smaller adjacent islands (of which 100 are inhabited), the Faroe Islands, and Greenland. Denmark proper was invaded by German troops on April 9, 1940, the entire country being quickly occupied. It has an area of 16,575 square miles, exclusive of Greenland and the Faroe Islands (qq.v.) with a population (1945 estimate) of 4,000,000.

Under the constitution of 1915, as amended in 1920, executive power was vested in the king (Christian X) who acted through a Cabinet responsible to the Rigsdag, which exercised legislative power jointly with the king. The Rigsdag was composed of two chambers—the Landsting, or Senate, of 76 members; and the Folketing, or Commons, of 149 members. However, after Aug. 29, 1943 these organs were prevented from functioning by the German occupants. For administrative purposes, the country was divided into

21 counties, each with a governor and a Council to supervise the rural municipalities. Copenhagen, the capital has, with suburbs, a population of over 1,000,000 (1944 estimate). Other large cities, with 1940 populations, are Aarhus (99,881), Odense (87,521), Aalborg (55,658), Esbjerg (33,155), Randers (32,928), and Horsens (30,417).

Education and Religion.—Denmark has had compulsory education since 1814. The school age is from 7 to 14. There are many secondary, professional, and vocational schools, as well as two universities, one at Copenhagen and the other at Aarhus. The Evangelical Lutheran is the established religion.

Production and Industry.—Denmark is a land of small farms, the development of which is encouraged by the law, which forbids their union into large farms. Before the Second World War Denmark was one large produce farm for England, motorized refrigeration boats carrying bacon, butter, eggs, and hams to Harwich in 18 hours. Peacetime Denmark had about half the world's trade in bacon, about 30 per cent in butter and eggs. Agricultural production was, of course, reduced during the occupation (April 9, 1940 to May 9, 1945) as a result of the inaccessibility of normal overseas sources of fuel, fertilizers, and fodder. Nevertheless, the number of head of cattle in August 1945 was about the same as before the war, although stocks of hogs had been somewhat reduced, and those of poultry considerably so.

Although Denmark has no minerals or water power it is one of the world's leading shipbuilding nations. It developed the ocean-going Diesel motorship. Clay and chalk on the east coast of Jutland provide materials for a large cement industry. Cement-making machinery for 700 plants throughout the world was manufactured in Denmark.

During the German occupation Denmark's greatest economic problem was that of trying to substitute for an industrial and commercial system based on world markets, a system limited to contacts on the European continent. Increased demand for machinery is said to have brought about a rapid development in the country's metal-processing industry, particularly in the manufacture of machines for preserving fruits, and processing wood, leather, and scrap metal. Whatever the extent to which German demands were responsible for this development, the total output of Danish products usable by the Germans is reported to have been substantially reduced by organized sabotage.

Denmark's fisheries are normally of the greatest importance, the value of the catch averaging about \$10,000,000 annually. The fishing fleet consisted of some 15,350 boats.

Despite Denmark's heavy losses due to the occupation, it was estimated that the Danes, during the summer of 1945, would be able to produce surpluses of some 17,000 tons of beef, 40,000 tons of bacon, 40,000 tons of butter, 4,000 tons of condensed milk, and 1,500 tons of cheese, in addition to sugar, vegetables, and fish, for export to neighboring countries badly in need of food. This favorable situation was understood to depend, however, on Allied plans for making available to Denmark the fertilizer, coal, oil, and transportation equipment and supplies required to produce and handle these surpluses.

Foreign Trade as Affected by the German Occupation.—The value of Danish imports for 1944 was estimated at 1,167,600,000 crowns, a decrease of 58,500,000 crowns from the preceding year.

Exports in 1944 amounted to 1,347,600,000 crowns—an increase of 49,500,000 crowns over their value for 1943. The heavy export surplus for 1944 (180,000,000 crowns) contrasts sharply with the import surplus of 90,000,000 crowns for 1938. Significant for Denmark's trade balance and entire economy was the huge sum of approximately 2,692,000,000 crowns owed by Germany to Denmark on Sept. 30, 1944, for Danish goods and services used by the Germans on their so-called "clearing account," still unpaid by them at the time of the German collapse. No less significant for Denmark was the sum of 3,801,000,000 or more Danish crowns (equivalent to \$773,500,000 in United States currency at rates prevailing in 1939) requisitioned by the German army of occupation from the National Bank of Denmark, also unpaid by Germany.

Since 1942, the German share of Danish exports (in which Germany had insisted on having priority) had been about 70 per cent. The remaining exports had been divided among Sweden, Finland, Norway, Italy, and other countries. In June 1945, following the liberation, Denmark arranged to send Finland machinery, foodstuffs, and metal goods to the value of 31,000,000 Danish crowns in return for Finnish products—largely building material—valued at 18,000,000 crowns, to restore an unfavorable trade balance. On August 3, credit to the extent of \$20,000,000 (provided for through a loan from the Export-Import Bank, Washington, D.C.) was granted by Parliament for purchase in the United States of various kinds of goods by representatives of the Danish industries.

Transportation.—More goods were carried in coastwise shipping in 1943 than in 1942; 6,884,000 metric tons against 6,673,000. However, only 6,018,000 tons of goods in foreign trade were loaded and discharged in 1943 as compared with 12,651,000 tons in 1938.

A net profit of 60,320,000 kroner during the first 9 months of 1943 was noted by the state railroads as compared with 48,890,000 kroner in the corresponding months of 1942. The transportation situation was nevertheless acute, owing to the lack of locomotives and increasing sabotage. Gas transportation was drastically curtailed in January 1944. In September of the same year only police, fire, and other emergency vehicles (some 2,603 in all) were using gasoline, while wood-fuel generators were being used for 19,331 trucks, 867 motor coaches, 2,297 taxicabs, and 1,150 additional passenger cars. Because of tire shortage, bicycle transportation, always important in Denmark, and vital under the emergency, decreased by 10 per cent in the Copenhagen area in 1943.

In June 1945 it was reported that two important Danish shipping firms had both made substantial increases in their capital, with a view to the replacement of shipping lost during the war.

Defense.—At the beginning of the occupation (April 9, 1940), the Germans promised not to interfere with Denmark's small defense forces. However, on Aug. 29, 1943, German troops attacked Danish units without warning. The army was disarmed and disbanded, the fleet scuttled by its own crews. Many Danes saw service, however, with United Nations forces. On March 31, 1944, a Danish minesweeper division was inaugurated by the Royal Navy, manned by Danes and flying the British and Danish flags side by side. The Danish underground organized a Danish Army of the interior, ready to attack the Germans on invasion day. Early in March 1945, the

underground forces were cited in a special communiqué from Allied supreme headquarters, praising their action in paralyzing German troop movements.

Principal Events of 1945.—The year opened gloomily for the Danes. There was every indication that their little country, along with Norway, had been earmarked for a last-ditch stand by the desperate Nazis. Work on fortifications on the west coast of Jutland and on the islands was speeded up. An endless stream of German troops, evacuated from Finland and Northern Norway, passed through Danish ports and airfields. The remnants of the German Baltic Fleet sought refuge in Copenhagen and other Danish harbors.

But German morale already was nearing the vanishing point. On February 5 it was learned in Stockholm that the commander of the German forces in Denmark, Gen. Hermann von Hanneken, had been replaced by Col. Gen. Georg Lindemann, owing to the former's failure to deal harshly with mutinies. For all his ruthlessness, however, Lindemann could not stem the rising tide of mutiny either. On February 24 a pitched battle between German regulars and Elite Guard troops took place in Copenhagen, with heavy casualties; later, 200 of the mutineers were executed by order of General Lindemann. Fresh outbreaks of mutiny, nevertheless, occurred in March.

In the face of Germany's steadily deteriorating military situation, Danish saboteurs greatly intensified their activities. Rail sabotage, impeding the redeployment of German troops from Norway, and the destruction of factories manufacturing parts for V-weapons became increasingly frequent. The effectiveness of this Danish contribution to the Allied war effort was hailed in a special communiqué from General Eisenhower's headquarters on March 5. In reprisal, the Germans multiplied arrests and executions of Danish patriots. The terror reached its peak of intensity in the last week of February during which some sixty people were murdered or executed by the Nazis. On March 21 British Mosquito planes bombed and completely wrecked Gestapo headquarters in Copenhagen, killing more than 300 Germans and making possible the escape of a number of prominent Danish patriots held in the building.

Throughout April the Germans made a show of their determination to hold Denmark and fight to the last man, but on May 1 the first signs of disintegration began to appear. Troops were withdrawn from less important towns, documents were burned outside Gestapo offices, the blackout was openly ignored in Copenhagen; patriotic crowds surging through the streets were not molested.

On May 2, however, a certain stiffening of the German attitude was noted, following the announcement of Hitler's death and the assumption of power by Grand Admiral Karl Doenitz. General Lindemann promptly wired a message of allegiance to the new "Führer," and ordered resistance continued in Denmark. A new wave of repression set in but the Gestapo was losing control. King Christian was ready to summon Parliament and form a new government. Throughout the day he conferred with Vilhelm Buhl, the premier deposed by the Germans in 1943. In Copenhagen, that night, underground papers were sold openly on the streets. On May 3, with British troops reported at the Danish-German border, German authority disintegrated swiftly throughout the kingdom. Although General Lin-

demann and the Gestapo chiefs did their utmost to halt defections, local German commanders in many places offered to surrender to Danish resistance forces, but they were told that piecemeal surrender could not be accepted.

On May 4 the complete surrender of German forces in Denmark was announced from General Eisenhower's headquarters. The Germans agreed to lay down their arms the following day at 2 A.M. At the request of King Christian, Mr. Buhl formed a new government with John Christmas Moeller as foreign minister and prominent resistance leaders in many key positions. Within a few minutes of the announcement of the German surrender, Copenhagen became the scene of tumultuous celebrations which lasted for days. British troops arrived in the city on the night of May 5. The popular joy was marred, however, when two German cruisers anchored in Copenhagen harbor unexpectedly opened fire on the city and Danish quisling forces attempted sporadic resistance. A total of 59 persons were killed and 386 wounded in these clashes.

Complete calm was restored on May 6, as a country-wide roundup of Danish traitors and collaborationists got under way. Within a few hours, 10,000 persons had been taken into custody by the "Freedom Fighters" now operating under the command of Gen. Ebbe Goertz of the Danish Army, who had been officially recognized by General Eisenhower. Among those arrested were Fritz Clausen, leader of the Danish Nazi Party; Jens Moeller, leader of the German minority in South Jutland; K. B. Martinsen, former chief of the terroristic Schalburg Corps; and the German minister and head of the civilian administration, Dr. Werner Best.

Parliament was convened by royal rescript on May 7 and formally opened two days later. Half a million Danes gave King Christian a tremendous ovation as he drove to Christianborg Castle for the opening ceremony. Field Marshal Sir Bernard L. Montgomery was received by the king on May 12 and awarded the highest Danish decoration.

That Denmark had been at war with Germany since August 29, 1943—the date when Danish self-government was abolished by the Germans and the constitution was suspended—was the opinion expressed on May 21 by Foreign Minister Moeller. Although no formal declaration of war could be issued at the time, he said, the Allies had accepted the warlike situation prevailing for the past two years. In conformity with this view, the United Nations Security Conference at San Francisco, by a unanimous vote, invited Denmark on June 5 to become the 50th member of the United Nations.

Following the liberation, General Lindemann had been made responsible for the orderly evacuation of the approximately 300,000 German troops stationed in Denmark at the time. The majority of these having left the country by early June, Lindemann's task was regarded as finished and on June 6 British forces occupied the German headquarters at Silkeborg and took the general and his staff into custody for investigation by the international war crimes commission. On July 9 it was announced that SHAEF's mission in Denmark, headed by Maj. Gen. Robert H. Dewing, was about completed, and that the number of Allied officers remaining in the country would be further reduced. The last Allied troops were scheduled to leave Denmark by the end of September, when all German soldiers had been evacuated.

There was, however, one big repatriation problem left which turned out to be unexpectedly difficult of solution. In the closing months of the war, some 300,000 German civilians, mostly from the eastern part of Germany, had taken refuge in Denmark, where they were housed mostly in public schools; of Copenhagen's seventy schools, sixty-five were taken over for that purpose. After liberation, the Danes naturally pressed for the return of these refugees to Germany, but none of the major Allies showed any willingness to receive them, each pleading that its zone of occupation in Germany already was overcrowded. It looked as though the Danes would have to play involuntary hosts to these Germans for another year or so.

Economic problems also weighed heavily on the minds of the new Danish government. Thanks to the country's highly developed livestock and dairy industry, the food situation was good—better, in fact, than in any other European country—and shipments of butter, eggs, and bacon to Great Britain were promptly resumed, but industry was confronted with a crippling shortage of raw materials, especially coal. Germany was out as a supplier of coal and Britain could offer only a small quantity, barely sufficient for the most urgent public services. To relieve the fuel situation somewhat, 80,000 men were sent out to dig peat during the summer. A provisional estimate of the cost of five years of Nazi occupation placed the total at around 9,000,000,000 kroner.

The new Danish government, conscious that it had not been formed according to normal parliamentary procedure, immediately took steps to organize general elections. These were originally scheduled for September, but technical reasons made it imperative to postpone them until October. Meanwhile, the government was generally accepted as being fully representative of the nation and of the approximate strength of the parties. The Communists, who had been outlawed during the Nazi occupation, also were represented in the Cabinet, for the first time.

The election, held October 30, resulted in a substantial decrease in Social-Democratic votes, and a corresponding gain for the Communists. Party strength in the new Folketing is divided as follows: Social-Democrats: 48 seats (previously 66); Agrarians, 38 (28); Conservatives, 26 (31); Communists, 18 (3); Liberals, 12 (13); others, 7.

On October 31, the Buhl government resigned and a week later, Knud Kristensen, leader of the Agrarian party, formed a new Cabinet.

DENTAL ASSOCIATION, American. See AMERICAN DENTAL ASSOCIATION.

DENTISTRY. The activities of dentistry in 1945 were again dominated by the various war influences, both before and after V-E and V-J days. Up to the time of the Japanese surrender there was a continuing demand for dental officers, confined largely, however, to the navy. Even before the end of the war in Europe the army indicated that it would seek no more dental officers. The navy, on the other hand, anticipating increasing demands for dental service in the Pacific theater, issued in April an urgent call for increased dental officer enrolment. Soon after the Japanese surrender, however, the enrolment of such officers was suspended. During this period the War Manpower Commission, recognizing statements of the Procurement and Assignment Service regarding civilian needs, declared that dental graduates not accepted for commission by

the navy should apply for commission in the U.S. Public Health Service or for internships in charitable dental clinics, hospitals, etc., which were recognized as essential to public health. Recruitment to those services as a result of this action was well above even prewar level and permitted more complete and more extended dental care by such institutions.

Dental Infection and Injury in the Army.—Vincent's stomatitis, or trench mouth, a real and serious scourge of the First World War has presented no real problem in this war, either overseas or in the United States. The overseas rate did not usually go above 2.5 per thousand and dropped to 1.5 per thousand in 1945. In the United States the rate was much higher. In this war there was no evidence of relationship between engagement in combat and the frequency of Vincent's stomatitis. As would be expected the rate for fractured jaws and associated injuries was closely related to combat, ranging from 15 to 26 per hundred thousand. The rate in the United States ranged between 5 and 8 per hundred thousand. Cellulitis resulting from dental infection had a higher incidence rate, as high as 40 per hundred thousand at one time, but was not appreciably higher among combat than among non-combat troops; this is probably a reflection of the generally poor oral condition of the men before induction and the tendency therefore for them to develop infections of the tissues adjacent to the teeth either from latent infection or as a result of required dental operations.

The figures on denture construction in the United States as reported in the Army Medical Bulletin in June 1945 show a rise from 2 per thousand men in 1942 to 8.3 in 1943, 16.2 in 1944, with a high of 19.95 in April of that year. In January 1945 the rate dropped to 14.9. Overseas, the rates were much lower, due to the requirement that men in need of dentures be fitted before embarkation. Considerable repair work was needed, however, in the European theater, the hard biscuits of K rations being one factor responsible therefor.

In a recent release it was stated that from Pearl Harbor through April 1945, the Army Dental Corps accomplished the following: fillings 67,000,000; extractions 15,600,000; dentures 2,246,000; bridges 231,000; prophylaxis 8,800,000. This means that for every 100 men inducted into the army there were 170 extractions and 740 fillings.

Dental Education.—The year 1945 saw an increasing effort, begun in the earlier years of the decade, to bring Latin American dentists to the United States to learn new technics and to become familiar with standardized procedures. Considerable attention was given to instruction in public health procedures because of the growing recognition of the part dental care plays in public health programs. The visits of these dentists to various dental and public health schools were made under the auspices of the United States Department of State and the American Dental Association. In return, several prominent dental educators have visited some of the Latin American republics, lecturing and giving demonstrations of dental methods before the dental societies and dental schools in those countries.

Through the courtesy of the Victoria Dental Association of Australia, certain of its meetings were designated as "American" nights with programs presented by officers of the U.S. Army Dental Corps stationed there. In November 1944 an interallied dental meeting was held with rep-

resentation from Australia, the United States and the Netherlands East Indies.

Early in 1945 Columbia University announced the merger of its dental school with the medical school, with control vested in a faculty of medicine in which medicine, dentistry, nursing and public health have representation, and which is headed by a dean who is a physician. The dental faculty is headed by a dentist with the title of associate dean. The object was to provide for dental students a more intensive training in so-called medical subjects with ultimate closer integration of the practice of medicine and dentistry. Since this action involved a definite loss of autonomy which this dental school, together with all but one other American dental school, had enjoyed previously and since it was feared by dentists generally that such action, if adopted by other universities, would result in a lowering of the standards of American dentistry, it met with nearly universal disapproval in the American dental profession.

The Netherlands East Indies government, with the aid of several United States dental schools and other institutions, began actively planning during the year to reopen and reorganize its dental school in Batavia, Java, as soon as conditions permit.

Postwar Planning.—The dental profession, aware of the extent and seriousness of the dental problem in the American population and considering that not only dental service but dental research is needed to cope with it, secured the introduction into Congress of two bills. One of these would set up a National Dental Research Council; the other would empower Congress to make grants-in-aid to the states to provide dental care under approved programs. At a hearing before the Pepper Committee on Health and Education, held in June, Surgeon General Parran of the U.S. Public Health Service gave testimony in support of these bills. He stated that the best available figures indicated that for the entire population the needs were as follows: extractions 238,500,000; fillings 632,000,000; prophylaxis 125,000,000; crowns and bridges 39,500,000; dentures 20,000,000; miscellaneous treatments 20,000,000. The service currently received is far below this figure as shown by the following table, presented in terms of need for the individual:

	Needed	Received annually
Extractions	1.9	0.03
Fillings	5.0	0.4
Examination and prophylaxis	1.0	0.03
Crowns and bridges	0.3	0.04
Dentures	0.2	0.01

Dr. Parran stated that the problem is not one of economic resources of the people alone, but of number and distribution of dentists (dentists tend to gravitate to areas with higher per capita income). There are about 70,000 dentists in the United States on a peacetime basis. The present ratio of dentists to population on an over-all basis is 1 to 1,800 (a desirable minimum ratio is held to be about 1 to 900).

It has been estimated that if complete initial care (attending to accumulated need) were to be undertaken, only 2,000,000 adults out of a total population of 130,000,000 could receive such service. Put in another way, each practicing dentist could give but one hour of service per year to each person in the United States.

The figures given above on the extent of dental service needed are for accumulated need. If all that need were met there would still be a very great annual need for dental care. It has been es-

timated that in any given year 33,000,000 new fillings would be needed for children between the ages of 6 and 18; for adults 79,000,000 fillings, to say nothing of other treatments needed. Recognizing this situation, dentists are stressing the necessity for planning to put every person as rapidly as possible on a maintenance basis. Emphasis would be laid on early dental care for children with maintenance care for each child as he advances in years.

Postwar planning involves dentists as well as their potential patients, especially dentists who will leave the military service when the army and navy are reduced to peacetime size. Many of them went into the armed forces immediately from college and have never had a practice. This group numbering around 5,000 must be absorbed into civilian practice within a short period in contrast with the approximately 1,600 who formerly entered practice each year. Dentists who left their practices to serve their country will expect to take up as nearly as possible where they left off. The dental societies have been actively planning to aid these men—the younger ones to find suitable locations, the older ones to find offices and also get their former patients back. Postgraduate courses on new technics developed in civilian dentistry during the war will be offered by dental societies and dental colleges.

Dental Research.—Dental research is carried on largely in the dental colleges, the research workers being also teachers. Shortage of teachers during the war put additional teaching loads on the research group and forced some curtailment of effort in this field.

Much attention has been given to studies of the value and best methods of use of the sulfa drugs and (lately) penicillin in control of some of the more severe dental infections such as cellulitis and Vincent's stomatitis. The study of war injuries of the jaws and adjacent structures has resulted in the development of improved methods of reducing jaw fractures and securing satisfactory cosmetic effects in handling the associated soft tissue wounds.

A bill (mentioned above) to support and encourage dental research was introduced into Congress. It would provide for the erection of a suitable building in Bethesda, Md., to house the National Dental Research Council, the creation of which it also would provide for. It also would provide for grants to be made to dental colleges and other institutions to aid in carrying on specific research projects.

*Director, The Murry and Leonie Guggenheim
Dental Clinic, New York City.*

D'ENTRECASTEAUX. See PAPUA, TERRITORY OF.

DESBOROUGH, LORD, the former WILLIAM HENRY GRENFELL, English sportsman: b. Oct. 30, 1855; d. Panshanger Park, Hertfordshire, England, Jan. 9, 1945. During his long career, Lord Desborough was known both for his personal accomplishments in various fields of sport and for his assistance in the promotion of Olympic games and athletic organizations. He was president of the Olympic games in 1908, and organized the first Olympics held in England that same year.

DEVERS, Jacob Loucks, United States Army officer: b. York, Pa., Sept. 8, 1887. General Devers succeeded Gen. Joseph W. Stilwell as commanding general of United States Army Ground Forces on June 29, 1945. As chief of

the Allied Sixth Army Group in Europe in the spring of 1945, he accepted the surrender (May 6) of German Army Group C—estimated at 200,000-400,000 troops—which ended resistance in western Austria and Bavaria. General Devers is a graduate of the United States Military Academy. In the First World War, he was executive officer of the School of Fire, Fort Sill, Oklahoma. From 1919 to 1924, he taught at West Point. In June 1939, he was assigned to the Panama Canal Department, and as chief of staff, directed mechanization of canal defenses. In the latter half of 1940, he was senior army member of the board appointed by President Roosevelt to locate the bases acquired from Britain. Promoted major general in October 1940, he was named commander of the 9th Division at Fort Bragg, North Carolina, and supervised that camp's enormous expansion program. He was transferred to the Armored Force command at Fort Knox, Kentucky, in July 1941, and there headed six panzer divisions, besides unattached tank battalions and a tank corps school. In September 1942, he was promoted lieutenant general, and in October 1943, given the Distinguished Service Medal for his service in the European theater. He was for a time deputy commander in chief to British Gen. Sir Henry Maitland Wilson in the Mediterranean theater. He was given command of the Allied Sixth Army Group in September 1944. On March 28, 1945, Devers was promoted to the rank of full general (temporary).

DIAMONDS. See GEM STONES.

DIETETICS. See BIOCHEMISTRY; NUTRITION,

DISASTERS. Below are listed in chronological order the principal disasters of 1945:

Jan. 9—Pan American Airways Clipper crashes at Port of Spain, Trinidad, killing 23 passengers.

10—American Airlines plane crashes and burns in canyon near Burbank, Calif., killing 24 persons.

18—Undetermined number of American troops killed and injured when train carrying more than 500 persons plows through station of St. Valery-en-Caux, 40 miles north of Rouen, France.

25—Soviet Ambassador to Mexico Constantine O. Oumansky and Mrs. Oumansky killed when Mexican military plane bursts into flames and crashes outside airport limits less than 2 minutes after take-off in Mexico City; 7 others killed, 2 seriously injured.

Feb. 1—Twelve members of staffs of British Foreign Office, War Office, and Air Ministry die in air crash on way to Big Three Conference.

5—Nineteen are dead, 20 missing when American tanker *Springhill* explodes in New York Bay at 8:57 A.M.

9—Blizzard kills 20 persons in Massachusetts, Maine, Rhode Island, and Connecticut, damage runs to millions.

12—Tornado kills 33, injures hundreds, and leaves thousands homeless in Mississippi and Alabama.

13—Twin-engined navy air transport crashes in San Francisco Bay at dawn, killing all 24 persons on board.

15—B-29 Superfortress crashes into Flushing Bay, N.Y., killing 5 of crew of 10.

19—Transport plane crashes on take-off from Italian field, killing 10 persons, including 3 officers of Lieut. Gen. Mark W. Clark's staff.

23—American Airlines plane, bound from New York to Los Angeles, crashes into mountainside near Cedar Springs, Va., killing 17 of 22 passengers and crew.

March 3—Crash of army transport plane in Europe, flying from England to Paris, results in death of 16 persons, including 7 USO entertainers.

5—Seven persons killed, 15 hurt as 2-engined C-60 cargo plane crashes and explodes at Wright Field (Dayton, Ohio), setting fire to hangar.

6—Worst Ohio River flood since 1937 results in death of 8 persons in 4 states.

7—Ohio River flood reaches crest of 69.2 feet, 17.2 feet above flood stage.

14—Storm of hurricane violence strikes B-29 Superfortress base in southeast Asia, killing 8 men, injuring 150, damaging about 25 cargo and transport aircraft.

28—Rio Piabanza overflows at Petropolis, Brazil, 40 miles north of Rio de Janeiro, resulting in death of 40 persons; damage estimated at approximately \$1,000,000.

April 5—Red River in Louisiana floods central section of state, topping levees, flooding farmlands, sweeping away livestock herds.

6—Fire destroys Pemberton Lumber and Millwork Corporation, Pemberton, N.J.; total damage estimated at \$1,400,000.

12—Tornadoes rip many communities in Oklahoma, killing at least 58 persons, injuring and leaving homeless hundreds more.

Tornado death toll in Oklahoma, Arkansas, and Missouri, reaches 112.

American freighter, Allied tanker collide off southeast coast of Massachusetts, killing at least 19 men; 3 more missing and 38 merchant seamen injured.

15—Pennsylvania Central Airlines plane crashes on Chestnut Ridge near Morgantown, W.Va., killing 17 passengers and crew of 3.

20—Army transport plane crashes, burns 3 miles from Sweetwater, Texas, killing 25 officers and men.

27—Chartered transport plane crashes at Washington, D.C., National Airport, killing 3, injuring 9 persons.

May 5—Navy announces 7 men killed, 2 injured in patrol bomber crash on southern slope of Mount Tamalpais, San Rafael, Calif.

25—Explosion in army's chemical warfare service headquarters at Edgewood Arsenal, Maryland, wrecks 2 buildings; causes deaths of 11 persons, injuries to 52.

June 4—At least 15 Americans and Germans killed, 80 injured when 2 mysterious explosions wreck U. S. military government police headquarters in Bremen, Germany.

15—Passenger train collides with derailed freight train near Milton, Pa., killing 18, injuring 32 passengers.

25—Twelve persons killed, 28 injured when bus loaded with soldiers strikes cow 4 miles south of Joplin, Mo., plunges down 10-foot embankment, and overturns.

July 7—*Dauntless Doty*, first Superfortress to bomb Tokyo, Nov. 24, 1944, crashes in take-off from Kwajalein en route to United States, killing 10 of its 13 passengers and crew.

10—Severe electrical storm in Phillipsburg, N. J., area kills at least 6 persons, causes huge property damage.

17—Explosion occurs on 5,265-ton *Hamonic*, Great Lakes passenger-freight ship operated by Canada Steamship Lines, while it is docked at Sarnia, Ontario, injuring more than 150 persons, causing heavy damage to ship.

18—Explosions at Royal Canadian Naval Arsenal rock city of Halifax, Nova Scotia, killing 2 persons, injuring more than 100.

23—Serious floods develop in northern New Jersey and Rockland County, N. Y., and in region east of Albany, extending into Berkshire Mountain area of Massachusetts, result of torrential rains which take toll of at least 3 lives, cause property damage estimated at upward of \$4,000,000, of which \$2,000,000 is in northern New Jersey.

28—Twin-engined B-25 army bomber, lost in fog, crashes into 78th and 79th floors of Empire State building, New York City, 913 feet above street level, causing considerable damage to building, killing 13 persons, injuring 26.

Aug. 9—Two sections of Great Northern Railway's *Empire Builder* collide at Michigan, N. Dak., killing 34 persons, injuring 50.

13—Fire breaks out at Export Box and Sealer Company, Detroit (Mich.) boxing factory, bringing death to 11 women, 2 men, injuries to 52 others.

17—Explosion of German ammunition on Oslo, Norway, waterfront kills at least 58 persons, injures hundreds of others.

25—Two B-29 Superfortresses crash in the air 15,000 feet above Weatherford, Texas, killing 18 airmen, injuring remaining 2.

27—Tropical 100-mile hurricane heads inland in vicinity of Houston, Texas, causing damage running into millions of dollars.

American transport plane bound for Atsugi airfield in Japan crashes on Okinawa airfield runway, killing about 20 Americans, destroying valuable communications equipment.

30—Fire sweeps Kaiser Oregon shipyards at Portland, Oreg.; damage estimated at \$3,000,000.

Sept. 3—U. S. death toll during Labor Day holiday reaches 341, with automobile traffic heavy.

4—Santa Fe Railway's eastbound *California Limited* plows into ditch near Arcadia, Calif., killing 15 persons, injuring 40; apparently hit open switch or broken rail.

Oct. 18—Crash of crowded IRT subway train in New York City results in death to 1 passenger, injuries to 40.

19—Navy announces casualties occasioned by Okinawa typhoon of October 10 now total 122, including 43 dead, 30 missing, 47 injured.

21—Two Rutgers University students and a young woman killed, 6 other persons injured when fire destroys Sigma Alpha Mu fraternity house in Brunswick, N. J.

22—Army's Alaskan Department announces death of 5 officers and 17 enlisted men in C-47 transport plane crash in swamp southwest of Elmendorf Field.

Nov. 4—Consolidated Airlines LB-30 transport flying from Honolulu to San Francisco crashes in the Pacific about 450 miles northeast of Hawaii; 7 persons killed, 8 rescued, 12 missing.

8—Three officials of Transcontinental and Western Airlines and crew of 5 men killed in crash of U. S. Army plane at Asmara, Eritrea.

30—Two-day storm sweeps across northeastern section of U. S., leaving in its wake at least 34 dead, many in-

jured, heavy property damage, disrupted communications.

Dec. 6—Five Navy torpedo bombers, with 14 men aboard and navy rescue plane, with 13 crew members, lost off Florida east coast.

8—Twin-engined transport plane crashes at Billings, Mont., killing 19 of 23 occupants, most of them army overseas veterans.

16—At least 7 persons are killed, 65 injured when Seaboard Air Line Railway's Florida-bound train *Silver Meteor* crashes into northbound *Sun Queen* near Kellogg, S.C.

25—Fire in Niles Street Hospital, Hartford, Conn., causes death of 17 people, injury to 27 others.

28—Twenty-three persons killed, 30 seriously injured by explosion of ammunition dump at Codroipo, near Udine, Italy.

U. S. traffic toll in 1945 placed by National Safety Council at 29,000 killed, more than 1,000,000 injured.

31—Rescuers give up hope of recovering bodies of 20 miners thought to have perished in mine explosion near Pineville, Ky., on December 26; seal chamber in which they are believed to have died.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and Christian Churches, sprang from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell, in western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1945. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; National Benevolent Association; Board of Church Extension; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are affiliated with the International Convention of Disciples of Christ which meets annually. The general missionary work both home and foreign of the churches is administered through The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind. Its board of managers of 120 is composed of 60 men and 60 women. The foreign missionary work in 1945 embraced the Belgian Congo in Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay and Batang, on the border of Tibet. However, because of the war, work in Japan and the Philippine Islands was suspended.

Statistics of the communion show that during the year there were 4,430 baptisms in the foreign fields. The 317 mission schools had a total enrolment of 13,374. The communion maintained 11 hospitals and 20 dispensaries which gave 653,111 treatments. The Church Extension Fund amounted to \$3,003,955.06 with outstanding loans to 265 churches. The Pension Fund for the ministry showed assets of \$4,635,793.41. One hundred young people's conferences were held. Work in America was conducted among the French, Highlanders, European immigrants, Negroes, Orientals, Spanish-Americans and Mexicans. The National Benevolent Association maintained six homes for children, and an equal number of homes for the aged. In 1945, 28 colleges, universities, Bible colleges and foundations co-operated with the Board of Higher Education. The total church membership throughout the world in 1945 was 1,943,441; and in the United States and Canada, 1,776,878. The Bible school enrolment for the world was 1,113,478, and for the United States and Canada, 1,013,679. Contributions, missionary, benevolent and educational, reported for the fiscal year in the United States and Canada, totaled \$8,759,872.65.

Among the periodicals published by the communion are *World Call*, *The Christian-Evangelist*, *Christian Standard*, and *Front Rank*. The president of the International Convention was Dr. M. E. Sadler, Fort Worth, Texas.

HAZEL I. SCOTT,
Secretary, *The United Christian Missionary Society*.

DISTILLED SPIRITS. Production.—Beverage distilled spirits production during the fiscal year ended June 30, 1945 amounted to 73,993,337 tax gallons, an increase of 207 per cent over 1944. The following table shows the production of beverage distilled spirits during the fiscal years 1945 and 1944 in tax gallons:

	1945	1944
Whiskey	41,562,303	2,887,794
Rum	2,887,794	2,212,457
Gin	2,058,894	
Brandy	26,584,256	21,592,388
Total	73,993,337	23,804,845

The whiskey production during the fiscal year 1945 was confined to the months of August 1944 and January 1945, periods during which the nation's whiskey producing facilities were released by the government from war alcohol production. No corn was released by the government for beverage production during August; consequently no bourbon whiskey was made during that month, although a limited quantity was permitted during the January production period.

In addition to the above production, registered distilleries produced 54,752,833 tax gallons of beverage neutral spirits and industrial alcohol plants produced 20,182,503 tax gallons of spirits for beverage purposes during such times as their facilities were released by the government. The total neutral spirits production amounted to 74,935,336 tax gallons.

Withdrawals.—Tax-paid withdrawals of distilled spirits during the fiscal year 1944-45 amounted to 142,334,194 tax gallons, an increase of 57.3 per cent over 1944. Withdrawals were distributed as follows: whiskey, 63,900,310 tax gallons (out of which total 9,586,865 were bottled-in-bond; rum, 540,192; gin, 1,946,822; brandy, 4,417,421; high-proof spirits, 43,692,885; and alcohol, 27,836,564. Withdrawals of whiskey were 8.6 per cent over 1944.

Rectified Spirits.—Rectifying plants during the fiscal year 1944-45 used 119,561,805 proof gallons of domestic and imported spirits, an increase of 76 per cent over 1944, and produced 118,830,492 proof gallons, 75.6 per cent over 1944. Rectifying plants and tax-paid bottling houses produced 162,028,875 wine gallons of rectified and unrectified products, an increase of 32 per cent over 1944.

Output for Consumption.—During the calendar year 1944 the bottled output of domestic distilled spirits plus imported products bottled after withdrawal from customs custody amounted to 150,272,565 wine gallons as compared with 131,077,698 during 1943. Of the 1944 total, whiskey amounted to 119,111,693 wine gallons; gin, 6,003,273; rum, 9,114,422; brandy, 4,185,373; and cordials, liqueurs, etc., 11,857,565. The whiskey output was distributed as follows: bottled-in-bond, 9,981,515; blended, 90,473,533; and straight, 18,656,645 wine gallons.

Apparent Consumption.—Based upon tax collections in the license states and upon actual wholesale and retail sales in the monopoly states, reports compiled by the Distilled Spirits Institute, Inc., Washington, D.C. indicate that the

apparent consumption of distilled spirits in the 45 "wet" states and the District of Columbia amounted to 166,382,804 wine gallons during the calendar year 1944, an increase of 14.3 per cent over 1943. Apparent consumption in the 28 license states and the District of Columbia amounted to 124,490,602 gallons, an increase of 17.6 per cent and monopoly state consumption was 41,892,202 gallons, an increase of 14.3 per cent.

The following table shows the five leading states in this category during the calendar year 1944 and indicates the type of control:

WINE GALLONS		
(1) New York	19,450,709	(license)
(2) California	18,634,708	(license)
(3) Illinois	12,810,252	(license)
(4) Pennsylvania	9,913,464	(monopoly)
(5) Ohio	7,156,590	(monopoly)

Stocks.—The following table shows the stocks of distilled spirits remaining in internal-revenue bonded warehouses at original entry gauge as of June 30, 1945 compared with the end of the preceding fiscal year (losses from leakage, evaporation, etc. not being determined until withdrawal):

TAX GALLONS		
	1945	1944
Whiskey	307,620,025	348,646,381
Rum	1,885,138	1,370,533
Gin	117,727	14,608
Brandy	12,371,296	11,528,107
Total	321,994,186	361,559,629

Revenues.—Total federal revenue from distilled spirits during the fiscal year ended June 30, 1945 amounted to \$1,617,262,318, an increase of 59.4 per cent over 1944, or 70 per cent of the total revenue of \$2,309,865,790 from all alcoholic beverages.

Excise taxes from domestic distilled spirits amounted to \$1,282,309,099 and from imported distilled spirits, \$199,690,666, a total of \$1,481,999,765, or 65.3 per cent above 1944. This increase was due principally to a war-time tax rate of \$9 per proof gallon, the rate having been increased from \$6 per proof gallon effective April 1, 1944. The remainder of the distilled spirits taxes was attributable to the sale of container stamps, rectification tax, occupational taxes, floor taxes, seizures, penalties, etc.

Imports.—Based on report of the Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce, the following table shows distilled spirits imported for consumption during the calendar year 1944:

		PROOF GALLONS
Whiskey		7,690,808
Rum		7,450,065
Gin		1,872,017
Brandy		4,382,896
Cordials and Compounds		1,310,465
Bitters		64,116
Ethyl Alcohol for Beverages		10,642,741
Total Dutiable Imports		33,413,108

Shipment from Non-Contiguous Territories

From Puerto Rico		
Cordials		135,767
Rum		6,740,500
		6,876,267

From Virgin Islands		
Rum		2,661,195
Whiskey		3,986
		2,665,181

Total Duty-Free Imports	9,541,448
Total Imports for Consumption	42,954,556

Exports.—Exports of distilled spirits from the United States during the calendar year 1944 were as follows:

	PROOF GALLONS
Whiskey	385,720
Rum	7,213
Other Distilled Liquors and Compounds Con- taining Spirits	21,279
Total	414,212
U.S. Shipments to Non-contiguous Territories	
To Alaska	
Whiskey	435,374
Other Distilled Spirits	118,754
	554,128
To Hawaii	
Rum	322,275
Whiskey	192,112
Other Distilled Spirits	113,740
	628,127
To Virgin Islands	
Rum	5,421
Whiskey	6,231
Other Distilled Spirits	759
	12,411
To Puerto Rico	
Rum	19,635
Whiskey	41,209
Other Distilled Spirits	988
	61,832
Total Shipments to Non-Contiguous Territories ..	1,256,498
Total Exports	1,670,710

OWSLEY BROWN,

Chairman of the Board, Brown-Forman Distillers Corporation, Louisville, Ky.

DISTRICT OF COLUMBIA. According to the 1940 census, the District of Columbia and its coextensive city of Washington then had a population of 663,091, compared with 486,869 in 1930, an increase of 36.2 per cent. The district has a total land area of 61 square miles and is entirely urban, the present population density averaging 10,870.3 inhabitants per square mile.

Government.—The District of Columbia is administered by a board of three commissioners, two of whom are appointed from civil life by the president of the United States and confirmed by the Senate, the third being detailed by the president from the Engineering Corps of the United States Army. District commissioners have ordinary municipal powers. Legislative power is vested in the Congress of the United States; however, the advice of the board of commissioners is sought before legislation is enacted. Residents of the District do not vote. Revenues are derived from a general real and personal property tax, corporation taxes, licenses, and appropriations from the Treasury of the United States.

Education.—Public elementary schools (1944-45), 133¹; teachers, 1,580; pupils, 57,706; average yearly salary of elementary school teachers, \$1,400-\$2,200². Public junior high schools, 19; teachers, 770; students, 20,769. Public vocational high schools, 5; teachers, 96; students, 1,702. Public senior high schools, 11; teachers, 681; students, 15,262. Average yearly salary of public vocational and junior high school teachers, \$1,600-\$3,200²; of public senior high school teachers, \$1,800-\$3,200². There are 2 teachers colleges in the District. Total appropriation for education (1945), \$14,943,770. District superintendent of schools, Robert L. Haycock.

Finances.—Following is a statement of the District's finances for the fiscal year 1945, supplied by the District Auditor's office:

Balance in treasury, beginning of 1945 fiscal year	\$27,362,902.76
Receipts, 1945	70,770,673.88
Total	\$98,133,576.64
Disbursements, 1945	68,208,054.35
Balance, beginning of 1946 fiscal year ..	\$29,925,522.29

DJIBOUTI. See FRENCH SOMALILAND.

DOBRUJA. A territory in southeastern Europe, divided between Rumania and Bulgaria. Its boundaries are the Danube River on the north and west, Bulgaria proper on the south (along a line drawn from above Turtucaia on the Danube to a point north of Varna on the Black Sea), and the Black Sea on the east. Its total area is 8,979 square miles, and its population (1937) 906,588, made up largely of Bulgarians, Rumanians, Circassians, Greeks, Tatars, Jews, and Turks. Until 1878, Dobruja formed part of Bulgaria, but in that year it was assigned to Rumania by the Treaty of Berlin to compensate for the loss of Bessarabia which went to Russia. Bulgaria never renounced her claim on southern Dobruja, and frequent agitation for its return led to a tentative agreement with Rumania in August 1940 for its transfer. On Sept. 7, 1940, by the Treaty of Craiova, Rumania ceded southern Dobruja, a territory some 3,000 square miles in extent, with a population of about 375,000, to Bulgaria. Dobruja is exceptionally fertile. Chief among the crops are cereals, beets, grapes, and tobacco. Mineral resources include copper and coal. Constanța (estimated pop. 60,490 in 1937), the most important Black Sea port of the province, from which an oil pipeline runs to the Rumanian oilfields, is Rumania's main sea outlet.

In August 1944 the Rumanian part of Dobruja was occupied by Soviet forces in their drive into the Balkans, Constanța being taken on August 29. On September 9, in the four-day war between the USSR and Bulgaria, the Red armies occupied the Bulgarian part, but by the terms of the armistice signed by Bulgaria with the Allies at Moscow on October 28 she was allowed to retain it. In November the first shipments of industrial and other equipment looted by Rumanian armies in the Ukraine left Constanța for Odessa.

DODECANESE (or SOUTHERN SPORADES) ISLANDS. A group of 13 islands in the Aegean Sea near the coast of Asia Minor, northeast of Crete. Known economically for sponge fishing, wine and olive cultivation, the islands have been important throughout history because of their value as steppingstones for invasion or migration from Asia Minor to Greece, and vice versa. Overwhelmingly Greek in population and tradition, they were captured from Turkey by Italy in 1912, ceded to Greece by treaties signed in 1919 and 1920, which, however, were renounced in 1922, and since held by Italy. Rhodes, at the southeast end of the archipelago, largest and best-known of the islands, and Leros, near the north end of the chain, were made into military strongholds by the Italian Fascists. Cos, second to Rhodes in size, was seized by the Axis forces after the fall of Greece in April 1941.

On Sept. 8, 1943, the Greek government-in-exile demanded that the Italians cede the islands to Greece. Soon afterwards they became the scene of a series of battles between the Germans and the Allies, which left the Germans in control, the British announcing on November 23 their evacuation of Samos, last Aegean island of consequence held by the Allies off Turkey.

¹ Number of school buildings includes six annexes to elementary schools.

² Salary figures do not include \$300 bonus. Teachers' Salary Act of 1945, effective July 1, 1945, replaced the \$300 additional compensation paid each educational employee from Dec. 1, 1942 to June 30, 1945.

During the remainder of 1943 and in January and February 1944, Allied air forces carried on a series of raids around Leros and Rhodes. On July 13-14 a British and Greek commando force killed or captured all the enemy garrisons and destroyed all defense installations on Simi (Symi). Simi, 4 miles from the coast of Turkey, has a well-protected harbor, which makes it a key shipping point. It had been evacuated by the British in October 1943. By early October 1944 the Dodecanese Islands in general had become rear-guard German outposts. On March 15, 1945, three of the liberated islands—Simi, Nisiro and Stampalia—requested union with Greece. Four simultaneous Anglo-Greek raids were made on Rhodes on May 1 climaxing a series that caused enemy casualties of 3,200. Within two days after May 8 the remaining German garrisons surrendered.

DOENITZ, Karl, German naval officer: b. Berlin-Gruenau, Germany, Sept. 16, 1891. Creator and commander of Germany's submarine fleet, and in 1943, Admiral Raeder's successor as commander in chief of the German Navy, Grand Admiral Doenitz proclaimed himself Reichsfuhrer "by Hitler's appointment," on May 1, 1945 (at the same time announcement was made of Hitler's unconfirmed death in the battle of Berlin), and gathered about him members of the German High Command and high Nazi officials. On May 6, Doenitz authorized the surrender to the Allies of Nazi armies on all fronts. In the days immediately following capitulation, his so-called "surrender government" at Flensburg put itself forward as the regime best qualified to deal with the task of bringing peace to Germany. On May 23, however, the Doenitz government was dissolved. Doenitz, Chief of Staff Col. Gen. Gustav Jodl, and Naval Chief of Staff Gen. Admiral Hans von Friedeburg were arrested by a SHAEF control party, as were all governmental ministers and civilian staff, and some 400 officers and 2,500 enlisted men of the once great German Oberkomande Wehrmacht. It was then revealed that the Doenitz government and the Oberkomande Wehrmacht had been allowed to function only so long as their services were required to speed disbandment of the defeated German Army.

A "severe, seamy-faced, beak-nosed little man," who urged his seamen to avoid any act of humanity, Admiral Doenitz was one of the Allies bitterest and most formidable enemies. At the height of the battle for the Atlantic, one magazine writer said, "his U-boat campaign is fought for keeps and one of its objects is to put terror into the sailors of the U. S. Merchant Marine." A veteran of the First World War, Doenitz is still of the opinion that Germany would have won that conflict by 1920, had there been a continuance of unrestricted submarine warfare. He joined the German Navy at the age of 18; transferred to the submarine service; and was later U-boat commander in the Mediterranean. In October 1918 he was taken prisoner after the sinking of U-88 by a British patrol, and interned in England. He was confined for a time after the November 1918 armistice in an insane asylum at Manchester, and was later repatriated to Germany as insane. After his return, he remained with the tiny fleet left to Germany. Doenitz was one of the alleged Nazi war criminals held for trial before the international military tribunal in late 1945.

DOMINICA. See WINDWARD ISLANDS.

DOMINICAN REPUBLIC. A republic in the West Indies, occupying the eastern two thirds of the island of Santo Domingo, or Hispaniola, scene of the earliest European settlement in the New World. The Dominican Republic has an area of 19,325 square miles. Its population (numbering 2,029,054 on June 30, 1945) includes some creoles of Spanish ancestry but is mainly of mixed European, African, and Indian descent. European refugees are being settled on 26,000 acres of tax-exempt land set apart for their use at Sosua. The refugees, while not permitted to compete with the natives in raising the basic crops (sugar, cocoa, coffee, and tobacco) are guaranteed full civic rights.

The republic is composed of 17 provinces and the district of Santo Domingo. The capital is Ciudad Trujillo—syōō dāid' trōō hē(1)'yō—(formerly Santo Domingo), which with its suburbs has a population of 115,232. Other important cities are Santiago de los Caballeros, Puerto Plata, San Pedro de Macoris, La Vega, La Romana, and Sanchez.

The island was discovered on Dec. 6, 1492, by Columbus on his first voyage to the new world. He called it La Española, or "Little Spain." The capital city was founded in 1496 by Bartolomé Colón, brother of the discoverer, and was for many years the center of Spanish power in America. In 1795 the colony of Santo Domingo was ceded to the French, who had colonized Haiti, the western end of the island. In 1808 the French were driven out, and Santo Domingo again became a colony of Spain. In 1821 it declared its independence, but in 1822 it was again taken over by the Haitians, who held it until 1844, when they were again expelled. In the same year, Santo Domingo became the Dominican Republic. In 1904, when the Dominican government defaulted in its debt payments, the United States began to collect the Dominican customs. In 1911 a series of revolts began, which led in 1916 to armed intervention and control by the United States. The United States Marines were withdrawn in 1924, but collection of the customs by the United States continued until 1941, when the Dominican government resumed responsibility for their collection and administration.

On Dec. 11, 1941, the Dominican Republic declared war on the Axis, and on Jan. 1, 1942, became one of the original signatories of the United Nations declaration. A new constitution, announced Jan. 10, 1942, provides for a representative form of government, with legislative, judicial, and executive branches. Legislative authority is vested in the Congress, which includes a Senate consisting of one member from each of the provinces and the District of Santo Domingo, and a Chamber of Deputies, with a minimum of two deputies from each province, with three from Santo Domingo. Members of both houses are chosen for 5 years by direct popular vote. Executive power is vested in the president, who is also elected by direct vote for 5 years. In the first general election held under the new constitution, on May 16, 1942, Gen. Rafael Leonidas Trujillo Molina was elected president, to serve until 1947. In this election, in which women voted for the first time, two women were elected to the Chamber and one to the Senate. The centennial celebration, held at Ciudad Trujillo and ended on Feb. 27, 1944, commemorated 100 years of national independence.

Military and Naval.—Military forces consist of

an army of about 300 officers and 3,000 men and the national police which, in addition to exercising police functions, provides a subsidiary force to the army. The republic has four coastal patrol boats and a small air force. Coastal artillery and other weapons were acquired by the government after December 1941 following declaration of war against Germany, Japan, and Italy. A Dominican graduate (in 1942) of the United States Military Academy at West Point is now military instructor in the Dominican Army.

Religion and Education.—All forms of worship are permitted, but Roman Catholicism is predominant. An archbishop, known as the Primate of the Indies, resides at Ciudad Trujillo, a papal nuncio having his residence at Port-au-Prince, the Haitian capital. Primary instruction is free and compulsory between the ages of 7 and 14. The schools are official, semiofficial, or private. There are 861 primary schools, 17 secondary schools, 14 normal schools, 60 technical schools, and the University of Santo Domingo (founded in 1538), with its eight professional faculties. In 1942 the government created 1,082 emergency schools, mainly in the rural areas. In 1943, 209,808 pupils were reported in all schools, and 1,120 at the university.

Climate and Natural Resources.—The climate of the republic is subject to two moderating influences: much of the interior is cool owing to high elevations; the coasts, swept by prevailing sea winds, have an average annual temperature of 78° F. Slightly more than half the total area is arable, but less than one fifth is under cultivation, the remainder being forested. The woods include cedar, satinwood, mahogany, lignum vitae, juniper, dyewoods, and pine, but much of the hardwood and pine has been cut. Mineral deposits include gold, copper, iron, coal, petroleum, silver, platinum, marble, and rock salt.

Agriculture.—Agriculture is the country's primary industry. Among the basic food crops are yucca, plantains, corn, and potatoes. Some poultry products, poultry, beans, and rice are exported especially to neighboring territories. Upward of 1,000,000 acres are kept in pasture for livestock.

The main commercial (export) crop is sugar, with coffee and cacao (cocoa) next in importance. The 1944 sugar crop amounted to 512,000 metric tons; but, due to prolonged drought during the growing season, the 1945 harvest was not expected to exceed 430,000 tons. Although about 2,000 metric tons of leaf tobacco awaited shipment in warehouses during 1944, only 995 tons were exported. Coffee exports for 1944 totaling 8,212 metric tons valued at \$2,009,173 were less than for 1943 (10,564 tons valued at \$2,469,141); but the 1944-45 crop was estimated in April 1945, when more than 90 per cent had been warehoused, at 15,000 tons. Cocoa exports for 1944, amounting to 25,562 metric tons valued at \$3,999,500, were second only to sugar in value. In June 1945 it was estimated that about 14,000 metric tons would be ready for market by August.

The government is endeavoring to diversify and improve agriculture and aid industry through legislation and state-sponsored experiments with special crops, such as soybeans, rubber and fibers.

Industry.—The country's growing industry and internal trade still depend mainly upon imports. In 1943 the fuel oil requirements of a leading Dominican electric company, source of power for essential industries, were 30,452 barrels, an

increase of 128 per cent over the amount needed in 1941. Hence the government's concession to a subsidiary of a large American oil company, which in 1943 began additional drillings. In 1944 a cement factory with an expected annual capacity of 360,000 barrels, and a textile plant for the manufacture of cheap clothing hitherto imported were constructed.

Transport and Communication.—The republic has a good highway system, including 1,000 miles of first-class roads and about 1,500 miles of second-class and intercommunal roads. The United Dominican Railroad, 152 miles long, connects centers in the fertile Cibao region with the northern coast, and there are some hundreds of miles of private railways on the sugar plantations and other private estates.

The harbor of Ciudad Trujillo has been improved, to accommodate large ships, and in the fall of 1944 plans were underway for a \$2,500,000 improvement of the chief sugar port, San Pedro de Macoris. The Dominican Republic, linked with the United States before the war by four steamship companies maintaining weekly passenger and freight service, has again been connected on a regular schedule with New Orleans and Buenos Aires with the arrival in Ciudad Trujillo on Sept. 14, 1944, of an Argentine motorship. The republic's merchant marine, which suffered heavily through enemy action, had by March gained four of the government's projected six new wooden motor-driven schooners.

Ciudad Trujillo has one of the best airports in Latin America. Due to its strategic location at a crossing of international airways, American and British aviation companies are planning to increase their facilities, and also establish internal air services during the postwar period. The republic has good telephone and cable service with all parts of the world.

Foreign Trade.—Exports in 1944 were valued at \$60,269,328, as compared with the 1943 figure of \$36,205,057. Imports were valued at \$18,524,575. As in 1943, textiles comprised an important share, the largest single item in that category being jute and other types of bags valued at \$2,808,903, with plain cotton fabrics in second place valued at \$610,270. The main exports in order of their importance were raw sugar, cocoa, molasses, coffee, and yucca starch. Britain was the best customer taking over \$37,500,000 worth of 1944 exports, with the United States in second place taking over \$13,000,000.

Finances.—Fiscal receipts for 1944 amounted to \$22,500,000, compared with the 1943 revenues of \$17,400,000. When the external debt was reorganized in 1943 it amounted to \$16,292,000. By January 1945 this had been reduced to less than \$12,000,000. The 1945 budget voted by Congress in December 1944, amounting to \$21,418,133, was the largest in the nation's history. On Jan. 20, 1945, a new tax of 3 per cent on imports went into effect, the additional revenues being earmarked for public works and social assistance. Sales taxes on alcoholic beverages and cigarettes were imposed at the same time.

Labor and Living Standards.—Government efforts to make good the lack of skilled labor through courses for textile and chemical workers are being combined with attempts to improve living standards, through laws providing for minimum salaries and paid vacations for workers, government housing, free lunches for school children, and adult education in hygiene, cooking, home management, and the cultivation of gardens.

In August 1944 the government announced the opening in various parts of the republic of 14 "economical diningrooms," serving about 3,600 meals a day at a cost of 10 cents a meal. A register of unemployed persons was also set up under government auspices, for use in placing employees, and the minimum salary laws were extended to include additional groups of garment and food workers.

On April 7, 1945, President Trujillo announced among other projects, creation of an agricultural loan bank, and construction of low-cost housing for workers and public employees earning less than \$100 per month. Underprivileged residents of the capital receive free milk, to the extent of 2,000 bottles daily, distributed by the municipal government.

DONATIONS AND BEQUESTS. Following is a list of the more important donations and bequests made during 1945:

The late Mrs. Gertrude Vanderbilt Whitney, socially prominent sculptress, widow of Harry Payne Whitney, bequeaths \$7,681,077 for charitable and public purposes.

New Jersey College of Agriculture, Rutgers University: gifts and pledges totaling more than \$20,000 toward fund for basic research in entomology, donated by industries and individuals in honor of Dr. Thomas J. Headlee, secretary emeritus, New Jersey Mosquito Extermination Association.

Building Fund of New Rochelle (N.Y.) Hospital: gift of \$51,500 from two Schaefer brothers, owners of F. & M. Schaefer Brewing Company.

Columbia University: cash gifts aggregating \$75,780 from Fred L. Lavenburgh Foundation and others.

Princeton University: legacy estimated at nearly \$4,000,000 from estate of Edgar Palmer, New Jersey Zinc Company official, and charter trustee of university.

Columbia University: grant of \$60,000 from W. K. Kellogg Foundation, Battle Creek, Mich., to be used in establishment of training course for hospital administrators.

Alfred P. Sloan, Jr., chairman, General Motors Corporation and sponsor of Alfred P. Sloan Foundation, sponsors \$4,000,000 grant for Sloan-Kettering Institute for Cancer Research at Memorial Cancer Center, New York City.

American Society for Prevention of Cruelty of Animals: bequest of \$250,000 under will of late Miss Edith Grennell Bowdoin.

New York National War Fund: from Climax Molybdenum Company, Inc., gift of \$18,100 and other gifts totaling \$25,250.

DONNAY (Charles) Maurice, French writer and playwright: b. Paris, France, Oct. 12, 1859; d. there, March 31, 1945. Educated at the Lycée of Vanves, the Lycée Louis-le-Grand, and the Ecole Centrale des Arts et Manufactures, Donnay made his reputation as a dramatic author in Montmartre during the 1890's and continued to produce both books and plays until the time of the First World War. He remained a figure in French letters for many years, largely by reason of his position in the French Academy, to which he was elected in 1907. He was one of a group of French men of letters who went to the United States in 1922 to take part in the Molière tercentenary. Among his plays are *Dialogues de Courtisanes* (1892), *Amants* (1895), *Educations de Prince* (1900), and *L'Assemblée des Femmes* (1930).

DOUGLAS, LORD Alfred (Bruce), English poet and author: b. Oct. 22, 1870; d. Lancing, Sussex, England, March 20, 1945. Lord Alfred Douglas is probably best known to the English and American public as the defense witness for his friend, Oscar Wilde, in the suits and countersuits between Wilde and Lord Alfred's father, the eighth Marquess of Queensberry, which eventually resulted in Wilde serving from 1895 to 1897 at hard labor for violation of the Criminal Law Amendment Act. He was educated at Winchester and at Magdalen College, Oxford, which he left without being graduated. He was the

author of several biographies, editor of the *Academy* (1907-1910), and founder and editor of *Plain English and Plain Speech*. Among his publications are *The City of the Soul* (1899); *Sonnets* (1909); *Collected Poems* (1919); *In Excelsis* (1924); *Complete Poems* (1928); *Autobiography* (1929); *The True History of Shakespeare's Sonnets* (1933); *Sonnets and Lyrics* (1935); and *Oscar Wilde: A Summing Up* (1940). He translated Wilde's play, *Salome*, written in French, into English in 1894.

DRAMA. See DANCE; MOTION PICTURES; THEATER.

DREISER, Theodore Herman Albert, American author: b. Terre Haute, Ind., Aug. 27, 1871; d. Hollywood, Calif., Dec. 28, 1945. Dreiser was a pioneer figure in the effort to introduce a serious and honest realism into American literature, to record all aspects of human experience without moral or ethical bias, after the manner of the French naturalists. Although his style was clumsy and his sense of structure weak, the wealth of detail and observation of fact and his penetrating understanding of the tragic struggle for conquest and survival in modern industrial society gave his work a monumental strength and profound social significance.

Born of a poor and intensely religious family of German origin, Dreiser attended Catholic schools in Terre Haute, Sullivan, and Evansville, and public schools in Warsaw, Indiana. Through the financial assistance of a former teacher, he was able to attend Indiana University, but after one year there he went to Chicago, where he worked in a real estate office, later became a collector for a wholesale furniture company, and in 1891 began reporting for the *Chicago Globe*. He was dramatic editor and traveling correspondent of the *St. Louis Globe-Democrat* (1892-93) and traveling correspondent of the *St. Louis Republic* (1893-94). In 1894 he went to New York and after working for a short time on the *World* and as a manual laborer for the New York Central Railroad, he became editor of the magazine, *Every Month*, in 1895. He subsequently did free lance work for various magazines, including *Harper's*, *McClure's*, *Century*, *Cosmopolitan*, and *Munsey's*. Through the recommendation of Frank Norris, then a publisher's reader, Dreiser's first novel, *Sister Carrie*, was accepted for publication in 1900; but after selling about 500 copies, the remainder of the issue was withheld from circulation by the publisher. When the public noted that the heroine was not punished for her sins or reformed, a great outcry arose branding Dreiser as a menace to American morality. This was the beginning of Dreiser's long struggle for the right of a serious novelist to present life as he sees it; at first, he fought alone through years of bitterness, scorn, and derision, but in later years his work enjoyed the enthusiastic support of such critics as H. L. Mencken. Dreiser served as editor of *Smith's Magazine* (1905-06); managing editor of *Broadway Magazine* (1906-07); editor in chief of Butterick Publications (1907-10); and with the *Bohemian Magazine* in 1910. Dreiser's principal commercial and popular success was *An American Tragedy* (1925), a powerful study of the influence of heredity and environment on a young man executed for the murder of his pregnant and unwanted sweetheart. Based on an actual murder trial, this novel was later successfully dramatized and filmed. In recent years Dreiser had done little writing, but he was active in Left

wing circles. He was accepted as a member of the Communist Party in July 1945. Dreiser's works include: novels, *Jennie Gerhardt* (1911), *The Financier* (1912), *The Titan* (1914), *The Genius* (1915), *The Bulwark* (1916), *The Stoic*; short stories, *Free* (1918), *Chains* (1927), and *A Gallery of Women* (1929); drama, *Plays of the Natural and the Supernatural* (1916), and *The Hand of the Potter* (1918); poetry, *Moods* (1926), *The Aspirant* (1929), and *Epitaph* (1930); autobiography, *A Book About Myself* (1922), and *Dawn* (1931); essays and travel books, *A Traveler at Forty* (1913), *A Hoosier Holiday* (1916), *Twelve Men* (1919), *Hey Rub-a-Dub-Dub* (1920), *The Color of a Great City* (1923), *Dreiser Looks at Russia* (1928), *My City* (1929), *Tragic America* (1931), and *America Is Worth Saving* (1941).

DUBIN, Al, American writer of popular songs: b. Zurich, Switzerland, 1894; d. New York, N.Y., Feb. 11, 1945. One of the most successful lyricists of the last 20 years, Mr. Dubin wrote the words of *Among My Souvenirs*, *Dancing with Tears in My Eyes*, *Shuffle Off to Buffalo*, *Tip-Toe Through the Tulips* and many others. He went to Hollywood in 1930, and wrote an average of 60 songs a year, principally for Warner Brothers. Among the pictures for which he provided the lyrics are *Forty-second Street*, *Show of Shows*, *Roman Scandals*, and four of the *Gold Diggers* series. In 1935, Mr. Dubin and his composer-partner, Harry Warren, received the Hollywood Academy award for the song *Lullaby of Broadway*.

E

EAKER, Ira Clarence, United States Army Air Force officer: b. Field Creek, Texas, April 13, 1896. To Lieutenant General Eaker belongs much of the credit for building the formidable United States Eighth Air Force in Great Britain, which joined with the British Royal Air Force to carry the war to Axis Europe. With his bomber commander, Maj. Gen. Frederick L. Anderson, and British Air Chief Marshal Sir Arthur Tedder, General Eaker wielded one of the largest and most flexible combinations of air striking power in existence. In December 1943, with the realignment of Allied high commands in preparation for invasion of the Continent, he was transferred to the Mediterranean theater to direct operations of the Allied Air Force¹ there, under the over-all command of Gen. Sir Henry Maitland Wilson. In early June 1944, he participated in the first shuttle-bombing raid on the Balkans by Russian-based Flying Fortresses and bombers of the United States Fifteenth Air Force. On April 24, 1945, General Eaker succeeded Lieut. Gen. Barney M. Giles as deputy commander of Army Air Forces and chief of the Air Staff, Washington.

ECONOMIC REVIEW. See **FINANCIAL AND ECONOMIC REVIEW.**

ECUADOR. A republic of South America, bounded on the north by Colombia, east and south by Peru, and west by the Pacific Ocean. The area, according to the settlement in February 1945 of the longstanding boundary dispute with Peru is variously estimated from 96,800 to 125,000 square miles, including the 13 Galápagos Islands (officially called Archipiélago de Colón, i.e., Columbus Archipelago) lying 600 miles from the Ecuadorean coast and having an area of 3,028

square miles. The population (est. Jan. 1, 1944) is 3,171,367. Formerly the *Reino de Quito*, it was conquered by the Incas of Peru in the 15th century; later the territory was included in the Spanish vice-royalty of Peru until the republic was proclaimed in 1822, after the Battle of Pichincha. A new constitution was formulated in the fall of 1944 under the administration of President Jose Maria Velasco Ibarra, who assumed office on May 31. The country is divided into 17 provinces and one territory. The capital is Quito (pop. 165,924 est. Jan. 1, 1944). Other towns are Guayaquil (172,948), Cuenca (48,300), Ambato (21,692), Riobamba (27,459), Loja (20,776), Latacunga (20,357), and Azogues (15,068).

Religion and Education.—Freedom of worship is granted to all denominations. The Catholic Church has an archbishop and six suffragan bishops. Foreign clergymen of whatever faith cannot enter the country without government permission, though such permission has been frequently granted in recent years.

Education is free, secular and compulsory in the primary schools (textbooks and scholastic materials supplied by the government or municipal authorities). There are also free continuation schools for vocational training of pupils who do not continue their studies in the secondary schools. Where Indian populations are dominant, Quechua or other native languages supplement the Spanish.

There are 47 day nurseries, 3,074 primary schools, 73 secondary schools, 70 professional schools and 4 universities, a total of 3,268 educational institutions. The total number of pupils and students is 274,196, including 2,355 men and 229 women attending the universities located at Quito, Guayaquil, Cuenca and Loja. A school for nurses at Quito gives free instruction to 30 selected pupils. The government includes in its annual budget a fund for scholarships for the higher education of sons of workmen, artisans and farmers.

Agriculture and Industry.—There are two agricultural zones, the lower river valleys where tropical products abound, and the hill country,

¹ On Feb. 3, 1945, General Eaker released the following report on results of Mediterranean Allied Air Force operations for 1944: 390,258 tons of bombs dropped on enemy targets in 604,383 sorties, with a loss of 5,306 planes; 4,203 enemy planes downed, 1,121 probables, and 1,475 damaged; 486 small ships sunk. On March 25, he announced that his air force had lost more than 20,570 men in 1944, 100 per cent of its strength. This involved the loss of about 2,050 heavy bombers.

adapted to grazing, dairying and the production of cereals, fruits, and vegetables of more temperate regions. The principal products are cocoa, ivory, nuts, rubber, coffee, tobacco, mangrove bark, hat straw and, in smaller quantities, sugar, rice, cotton, lentils, Indian corn, wheat, barley, potatoes, and a variety of vegetables. The cocoa crop in 1943 amounted to 393,899 quintals of 101.4 pounds each, representing a gain of 33.6 per cent over 1942; but the 1944 yield was only 294,514 quintals. However, the first six months of 1945, totaling 231,087 quintals, 72 per cent above the amount in the relative 1944 period, indicate the probability of another bumper crop of perhaps 350,000 quintals. The sugar crop in 1944 was 26,000 short tons, as compared with 1943 production of 31,000 tons. The entire 1944 crop was purchased by the government. According to a September 1945 report, the coffee crop for the year will probably not exceed 250,000 quintals, as compared with 350,000 in 1944. The cotton crop of 1943-44 amounted to 7,350 bales of 500 pounds each. In June 1945 the 1944-45 crop was estimated at not more than 5,000 bales. Normally, Ecuador has to import cotton for its textile industries; domestic consumption will probably require importation of 6,000 or 7,000 bales from Peru and Paraguay in the latter part of 1945. The 1943 domestic crop of tobacco was poor, and imports from the United States in 1943 were 300 per cent over 1942. A substantial reduction in tobacco acreage in 1944 induced the government in 1945 to pass laws favoring increased production. After the harvest of the 1945 "winter" rice crop amounting to 1,100,000 quintals, it was estimated that the second crop would amount to only about 300,000 quintals, making a total 1945 production of about 20 per cent less than in 1944. Of this production about 350,000 quintals are for shipment to Cuba, pursuant to terms of a rice-sugar exchange agreement. The United States government arranged to purchase the entire 1945 kapok production which in the first quarter amounted to 81,691 kilograms, treble the amount in the corresponding period of 1944. There are large forest areas, including more than 90,000 square miles of virgin timber. Ecuador is the world's chief source of balsa wood. The 1945 production, according to June estimates, may reach 15,000,000 feet, less than half the 1943 record year output of 37,000,000 feet. Mineral products include gold, silver, quicksilver, lead, iron, copper, and some emeralds and rubies. Gold production in the first quarter of 1945 amounted to 10,236,013 ounces, the 1944 total production having been 51,601,441 ounces. All salt mined must be sold to the government, and there are large sulphur deposits. In recent years oilfields have been developed. Petroleum production in 1944 was 121,471,900 gallons valued at 42,515,100 sucres; in the first quarter of 1945, production was 27,239,300 gallons. Nearly all manufactured products are for local consumption, the outstanding exception being the Panama (or "Jipijapa") hat, made by hand of Toquilla straw and rarely worn by the Ecuadorean.

Finances.—The external debt of Ecuador on June 30, 1945, amounted to \$30,863,000; consolidated internal public debt, 158,343,348 sucres. (At par one sucre equals 20 cents in United States currency, but since 1939 has equaled six or seven cents, the value during the first quarter of 1945 being slightly more than seven cents.) The budget for 1945 of 335,150,000 sucres, approved by the Constitutional Congress in March, was re-

duced in May to 246,685,000. Of this sum 57,000,000 sucres is earmarked for public works, and 42,000,000 for the Ministry of Education.

Communications.—There are 1,591 miles of main highways, 1,121 of branch roads, and 2,227 miles of trails. Ten railways in operation have a total length of 906 miles. There are 5,444 miles of navigable rivers, but only about 400 are in general commercial use. The most important river systems for transportation are the Guayas in the south and the Esmeraldas in the north. During the rainy season there is river communication in the principal agricultural districts. There are 10 seaports, 446 post offices, 211 telegraph offices with 4,083 miles of telegraph wires, and 95 telephone offices with 7,753 subscribers in the capital. A presidential decree of April 1945 authorized the government to contract for the establishment of an internal telecommunications system. Pan American-Grace Airways operates a domestic air service, and international air routes connecting Ecuador with the Canal Zone, Peru, and Chile are maintained on a schedule of four trips per week. On July 20, 1945 a 10-year contract was made by the government with an American corporation, the West Indies Flying Service, to establish passenger, mail and freight air transportation between numerous cities in Ecuador. The drastic reduction of 75 per cent in import duties on automobiles, busses, trucks, tires and automobile parts, made by an executive decree of June 9, 1945, promises to relieve pressing transportation problems.

Foreign Trade.—The value and quantity of exports of Ecuadorean products continued to far outweigh the value and quantity of imports during 1944, thus piling up unprecedented trade balances in the foreign markets. Laws controlling imports were drastically reformed to permit a more elastic manipulation of foreign trade. Rice, cacao, rubber, petroleum, fruit, balsa wood, and Panama hats were the major export items. Exports in 1944 totaled 466,630,000 sucres and imports 331,154,000 sucres. Since 1938, with the exception of the year 1940 when the balance of trade went against Ecuador to the extent of 5,903,000 sucres, the country has had continual favorable trade balances.

A table of commercial balances for the quinquennial 1940-44, issued by the government Aug. 31, 1945, and set forth below, shows somewhat different figures due to the fact that the export figures do not include the values of crude petroleum, copper in bars, and gold, copper and lead concentrates. This accounts for the apparent deficit in 1941 when there was actually a surplus.

Year	(in thousands of sucres)		
	Export	Import	Bal. { surplus+ deficit -
1940	101,624.7	173,753.3	-72,128.6
1941	139,160.7	149,499.2	-10,338.5
1942	228,565.7	199,715.1	+28,850.6
1943	302,922.8	217,983.0	+84,939.8
1944	383,400.2	331,156.0	+52,244.2

Principal Events.—The success of Brazilian mediators in settling the boundary dispute which had venomized relations between Ecuador and Peru for over a century was indicated by a cordial exchange of messages between the presidents of the two countries in July 1945, five months after an agreement had been reached at Rio de Janeiro which, in the main, favored Peru's side of the case. A popular uprising in Ecuador, which had been staged in the spring of 1944 by the Democratic Alliance, a coalition including labor and liberal groups, resulted in the resignation of President Carlos Arróyo del Río, and

the installation of the exiled Dr. José Maria Velasco Ibarra as acting president on May 31. Within the next week Brazil, Peru, Paraguay and the United States recognized the new regime. Elections were postponed until July 23 when 90,000 voters gave the Democratic Alliance a clear majority in the constitutional assembly appointed to formulate a new constitution (promulgated in March 1945). Dr. Ibarra was proclaimed president by popular acclamation.

A good economist and vigorous administrator, Dr. Ibarra immediately applied himself to the solution of his country's serious economic, political and social problems. The year 1945 saw the initiation of several major public construction projects. Among these were a modern water-purification system for Quito, estimated to cost \$1,000,000; Guayaquil's expanded water supply system, drawing additional water from the Daule River 12 miles above the city; erection in Guayaquil of municipally sponsored low-cost housing for workers; development of irrigation systems in the provinces of Chimborazo, Manabi, Guayas, Pichincha and Imbabura. The end of the Second World War saw a notable increase of building activities in Ecuadorian cities. Many municipalities began construction of electric plants to furnish light and power. By legislative decree, effective from June 12, all construction materials, when destined for theaters and amusement centers, were exempted from customs and consular duties. Under the Inter-American Co-operative Health Service hospital construction in 1944 and 1945 made rapid strides. The earthquake damaged hospitals in Manabi province were repaired and remodeled, and a children's pavilion was added to Guayaquil's maternity hospital.

EDEN, Robert Anthony, British statesman: b. June 12, 1897. Britain's former secretary of state for foreign affairs and head of her delegation to the San Francisco Conference (April 1945). Mr. Eden is a veteran of 22 years in British politics. He was elected member of Parliament for Warwick and Leamington in 1923; in 1934, took his first Cabinet post, that of Lord Privy Seal; and in 1935, became minister without portfolio for League of Nations Affairs. In December of the latter year, he was appointed foreign secretary, a position he resigned in February 1938, in protest against Prime Minister Neville Chamberlain's appeasement policy toward Germany and Italy. This was not the first time Mr. Eden had defied the head of his government. While serving under Prime Minister Stanley Baldwin, he strongly opposed the deal with Mussolini, proposed in the Hoare-Laval scheme for settlement of the Abyssinian question, and according to James Weston of *The Christian Science Monitor*, "was largely responsible for forcing Sir Samuel Hoare out of the government." Mr. Eden returned to the Cabinet in 1939 as secretary of state for dominion affairs, and in May 1940, became secretary of state for war under Prime Minister Churchill. He was again appointed foreign secretary in December 1940, and in November 1942, assumed additional duties as leader of the

House of Commons, succeeding Sir Stafford Cripps. In 1943, he represented Britain at the Moscow Conference of Foreign Ministers and accompanied Mr. Churchill to the Teheran meetings with Premier Stalin and President Roosevelt, and the Cairo conferences with Generalissimo Chiang Kai-shek of China and Turkey's President Ismet Inönü. Three times in 1944 (January, July, October), he met with Polish Premier Stanislaw Mikolajczyk in an effort to speed settlement of the knotty Russo-Polish boundary controversy. He had occasion in February 1944 to restate the object of Britain's foreign policy when he told Commons that Great Britain sought "to maintain peace and protect the rights of small nations in co-operation with nations of the British Commonwealth, the United States, and Russia," at the same time reserving the right of intervention in the settlement of political affairs in any part of Europe. While Mr. Eden is an able and fearless advocate of world co-operation, he is first a staunch nationalist, and like Mr. Churchill, has made it plain that he will not "officiate at the liquidation of the British Empire." In September and October 1944, he attended the Quebec and Moscow conferences, and in December, accompanied Mr. Churchill to Athens to attempt to put an end to the civil war raging in that city. He made a second visit to Athens on Feb. 14, 1945, on his way back to London after the meeting of the Big Three at Yalta in the Crimea. The following April, he headed the British delegation to the United Nations Conference convened in San Francisco. With Prime Minister Churchill, he attended the Potsdam Conference, convened on July 17, 1945. Mr. Eden went out of office as foreign secretary with the overwhelming defeat by the Labour Party of the Conservative Party in the July parliamentary election, the results of which were announced July 26.

Mr. Eden was educated at Eton and Christ Church College, Oxford. In the First World War, he served with the King's Royal Rifle Corps. He has published two books, *Places in the Sun* and *Foreign Affairs* (1939).

EDUCATION, Review of. Public School Enrolments.—The session of 1944-45 marked a new low in public school enrolments since the outbreak of the war, according to estimates prepared by the Statistical Division of the U. S. Office of Education. In 1942-43 there were 24,155,146 pupils enrolled in our public schools (elementary, 18,033,080; high school, 6,122,066). The next session the enrolment decreased 3.7 per cent to 23,256,000 (elementary, 17,766,000; high school, 5,490,000). Actually, the percentage decrease in high school enrolment (10.3) was nearly seven times as great as that in the elementary school (1.5). A further decrease, but relatively slight as compared with that of the previous year, occurred between 1943-44 and 1944-45. The total public school enrolment dropped to 23,197,300, of whom 17,740,500 were in elementary schools and 5,456,800 in high schools. Comparative statistics for the three sessions, with percentage decreases for the two-year period, are as follows:

PUBLIC SCHOOL ENROLMENTS, 1942-45

	1942-43	1943-44	1944-45	Per cent decrease Two-year period
Elementary	18,033,080	17,766,000	17,740,500	1.5
High School	6,122,066	5,490,000	5,456,800	10.9
Total	24,155,146	23,256,000	23,197,300	4.0

The percentage decrease in the number of boys enrolled in high school was twice that of the girls, as is to be expected when draft calls and employment opportunities are considered. The largest losses in enrolment were in the number of boys in high schools in cities of 100,000 population and over. The decrease in the number of boys enrolled in the last two years of high school was also striking, averaging 20 per cent in the two-year period.

School enrolments, public and private, for the session 1944-45 are estimated as follows by the Office of Education:

	Public	Private	Total
Elementary	17,740,500	2,088,900	19,829,400
Secondary	5,456,800	458,700	5,915,500
Total	23,197,300	2,547,600	25,744,900

Back-to-School Drive.—The decrease in high school enrolment during the war has caused serious concern. From an all-time peak of 7,250,000 in 1940-41, enrolment dropped 300,000 in 1941-42; 300,000 in 1942-43; and 600,000 in 1943-44. Only a negligible drop occurred in 1944-45, thanks largely to the 1944 National Back-to-School Drive. Nevertheless, at the close of the 1944-45 session, enrolment was more than a million below its prewar peak. A new Back-to-School Drive, sponsored jointly by the Children's Bureau of the U.S. Department of Labor and by the U.S. Office of Education, was launched in August 1945. An increase of 250,000 in high school enrolment was set as the goal in an effort to enroll again teen-age boys and girls who have not completed their high school education. The drive was enthusiastically endorsed by representatives of education, labor, industry, and government. "Fact Sheets" and "Action Ideas" were prepared for the use of educational, civic, and community agencies.

While some of the shrinkage in high school enrolment has been due to a decrease in the number of boys and girls of high school age, by far the greatest loss is attributable to the increase in youth employment. In 1940 approximately 900,000 boys and girls, 14 through 17 years of age, were at work. In the spring of 1945 nearly 3,000,000 were employed. Half of these had dropped out of school entirely, while the others held part-time jobs. It is expected that many of the 1,500,000 youths who have left school for full-time jobs will be laid off as cut backs occur. With the canceling of war contracts and the release of men from the services, adult workers can take over many of the jobs now done by boys and girls of high school age. A special effort is being made to get these young people back in school.

Teacher Shortage.—Again in 1945-46 the schools of America faced a severe shortage of teachers. Although the situation is most serious in the South and in the rural areas, every section of the country is seriously affected, according to a survey conducted by the New York *Times* (June 24, 1945). During the session of 1944-45 approximately 80,000 emergency licenses to teach were issued, an increase of 20,000 over the previous year. Teacher turnover has continued at an unprecedented rate. During the past two years 300,000 teachers, or one out of every three, have changed their positions. Some 150,000 have left the profession to take jobs in industry or enter various branches of military service. There are today 60,000 fewer teachers than in 1942.

Such a situation has had far-reaching effects upon the nation's schools. In rural communities

it has been necessary to close some of the smaller schools. In the larger schools, courses or whole departments, especially in the specialized fields, have been discontinued temporarily for lack of teachers. The shortages are most acute in physical education both for boys and girls, industrial arts, home economics, commerce, mathematics, and science. Most of these areas require a specialized college course for successful teaching; it has been very difficult to staff them with "emergency" teachers. The *Times* survey gives graphic evidence of the effect of the teacher shortage upon the schools in various states. Arkansas issued 8,788 emergency certificates for the 1944-45 session. Although Mississippi issued 1,358 emergency certificates, there were still 600 unfilled teaching positions. Twenty-nine high schools offered no science of any kind for lack of teachers.

Arkansas officials believe it will be years before the shortage of from 5,000 to 6,000 qualified teachers is remedied, especially since the number of graduates from the teachers' colleges has declined 80 per cent since the beginning of the war. The average preparation of teachers in Arkansas has dropped to 1.9 college years.

The *Times* survey indicates that the shortage is nationwide. Illinois issued 3,451 emergency certificates in 1944-45; it issued 2,356 the year before. One thousand teachers are still needed. Ohio issued 5,790 emergency certificates last session, or 14 per cent of the total number of teachers employed. There was still a shortage of 750 teachers. Many departments were dropped, such as music, physical education, industrial arts, and business education. Elementary classrooms were seriously overcrowded. California has granted 9,000 temporary licenses, or one fifth of the total teaching staff. Iowa issued 5,500 emergency certificates last session.

Emergency Certificates.—The emergency certificate is a temporary license to teach issued to a person who does not meet the usual qualifications for certification. Issued rather rarely before the war, usually to teachers of applied subjects who did not meet the collegiate requirements, the temporary certificate is now held by at least 80,000 members of the teaching staff. All of the states now issue this certificate. The average number issued per state during 1943-44 was 1,446; in 1944-45, it had risen to 1,778 per state, with some states having as many as 9,000 emergency teachers.

Most of the states issued temporary certificates on the recommendation of local school superintendents who state that the person for whom temporary certification is requested is the best qualified candidate available for the position. The minimum requirements for emergency certificates vary greatly among the states. In 9 out of the 40 states for which data are available, no minimum requirements are specified, reliance being placed upon the recommendation of the local superintendent. Ten states require high school graduation only. Twenty-one states require some college work, varying from less than a half year to four years. In a number of states the requirements vary with different types of emergency certificates. So great are the variations in certificate requirements throughout the country that holders of emergency certificates in some states have more preparation on the average than holders of regular certificates in certain other states. However, in the majority of cases the requirements for temporary certification are from one

to two years below the minimum requirements for regular teaching certificates.

According to Dr. Benjamin W. Frazier, senior specialist in teacher education, U.S. Office of Education: "The qualifications of emergency teachers are uncertain not only in amount of preparation, but also in personality, experience, maturity, and other qualifications. Included among emergency teachers are teen-age high school students, retired teachers with a lifetime of experience, married women ex-teachers, college graduates and former students with no professional training or experience, tradesmen, and a variety of other persons."

Steps have been taken as safeguards against the postwar retention of under-qualified emergency teachers. In more than two thirds of the states the emergency permits are valid only for one year or for the school session for which issued. In many states they are not renewable, new permits being issued instead. In other states they are renewed only after the holder has taken some in-service preparation. Most states plan to discontinue the emergency certificate as soon as qualified teachers become available.

Meanwhile, strenuous efforts have been made to improve the effectiveness of emergency teachers through in-service training. Extension classes, workshops, off-campus study centers, planning conferences, supervisory services, inter-visitation of teachers, summer school courses and workshops, and correspondence courses are reported in wide-spread use.

Certification of Teachers.—Although there has been a decided lowering of standards through the issuance of war emergency permits to teach, little if any permanent change in state certification regulations has occurred. Fourteen states and the District of Columbia now require four years of college work as a minimum for the lowest grade *regular* certificate issued to elementary school teachers. Five states and the District of Columbia require a minimum of five years of college work for beginning high school teachers of academic subjects.

Twenty-five of the states still issue regular teaching certificates for the elementary grades on two years or less of college work. In fact, eleven of these states issue such certificates on the basis of one year of college work. However, in several cases holders of these certificates may teach only in rural elementary schools. Five states still issue certificates upon a basis of graduation from high school or high school normal training courses, and seven upon examinations for which no scholastic prerequisites are specified. In spite of the progress made in raising certificate requirements, it is evident that there is still wide variation in standards among the states. From two to five years of college work may be required for a high school teacher's certificate, while the range for an elementary teacher's certificate varies from high school graduation to four years of college, plus, in the District of Columbia, an examination.

The raising of certification requirements is dependent to a large degree upon the supply of teachers. Whether the continual progress made up to 1941 will be resumed in this postwar period is uncertain. Teachers colleges are not attracting as large numbers of students as formerly. Many now offer liberal arts courses as well, and smaller proportions of their graduates actually go into teaching. There seems to be a definite need for making teaching more attractive as a profession. Most authorities insist that adequate sal-

aries for teachers is the only real answer to this problem. However, it seems difficult to convince the public at large, and especially its tax-levying bodies, that an investment in public education is truly an investment in the citizens of this country. As such, the dividends that accrue are not only statistical gains in school grade completed, literacy, etc., but definite advancement in earning power, purchasing power, economic sufficiency, intelligent citizenship, and practical democracy.

Vocational Education: Enrolments.—Enrolments in federally-aided vocational classes decreased 280,607 between 1942-43 and 1943-44, due largely to conditions arising from the war. According to the Vocational Division of the U.S. Office of Education, the decrease in agricultural classes is attributable to a reduction of the number of departments in rural schools, the induction into service of farm youth, and the time and effort teachers have given to the Food Production War Training Program. A somewhat similar situation also accounts for the loss in enrolment in trade and industrial classes. The decrease in home economics reflects the general decrease in high school enrolment. Enrolments in the federally-aided vocational classes for 1943-44 were as follows: Agriculture, 469,959; distributive education, 181,509; home economics, 806,515; trade and industrial education, 543,153; total, 2,001,136. The total enrolment in 1942-43 was 2,281,743.

Vocational Education: War Training Programs.—On June 30, 1945 the federally-sponsored war training program was officially terminated. Established as an emergency measure in the fall of 1940, this huge vocational project under the general direction of the U.S. Office of Education resulted in the training of over 12,000,000 men and women for war jobs at a cost of some \$500,000,000. Described by the *New York Times* as "one of the most ambitious educational projects ever undertaken in this country," the training program operated on three levels: on the college and university level, 1,500,000 men and women received specialized training in 238 institutions; on the secondary level, 8,000,000 in 2,500 schools; in the food production program, 2,500,000 in 15,000 farm communities.

The college program was known as the Engineering, Science, and Management War Training Program. Established originally in October 1940 to make available "short intensive courses of college grade designed to meet the shortage of engineers in fields essential to the national defense," the scope was later widened to include the fields of chemistry, physics, and production supervision. All courses offered under this program were of college grade. High school graduation or its equivalent in training and experience were prerequisite for admission.

Direct participation in the program was limited to institutions granting degrees in one or more of the four fields designated for training. A total of 238 institutions participated, offering courses not only on their own campuses, but wherever in the region they served a need for college level training was indicated. Instruction was carried on in over 1,000 cities, frequently in the plants being served, at any hour of the day or night that was most convenient for the trainees.

Tuition free, the 42,163 courses that were offered during the five years of the program enrolled 1,791,206 trainees, distributed among the four fields as follows: engineering, 1,332,570;

production supervision, 386,011; chemistry, 39,392; and physics, 33,233. About 6 per cent of the trainees were enrolled in full-time courses of from 6 to 15 weeks' duration, in preparation for employment in war industries. The remaining 94 per cent were largely persons already employees in war industries, who were preparing for more responsible positions or seeking improved skill for their present position.

According to the Office of Education, much evidence is at hand, in the form of statements from industrial executives, indicating that by providing specialized training vitally needed in war industry this program greatly expedited war production. "It seems likely that without it the record made by American industry during the war would have been impossible," states *Education for Victory* (June 20, 1945).

On the high school level, the Vocational Training Program for War Production Workers reached 2,600 training centers. While under the U.S. Office of Education, the responsibility for the actual operation of the program was delegated to the various local boards within the states. Each state appointed or designated a state director of VTWPW who was immediately in charge of the program. Every type of course needed for industry was offered. Courses lasted from six to ten weeks, depending upon the skill to be acquired. The greatest number of trainees were enrolled in automotive services (167,661), aviation (1,797,830), electrical (117,645), machine shop (1,214,235), radio (251,613), shipbuilding (1,389,609), and welding (514,149) classes. Students ranged from high school girls who took up welding to experienced ship builders preparing themselves for upgrading.

The courses were provided without charge of any kind. The vocational departments of some 500 high schools operated on a 24-hour basis. Emphasis was placed upon jobs that could be learned in a comparatively short time, for the urgency of war production needs had to be met. Trainees were placed on the job as soon as they were thought to be reasonably efficient. Between July 1, 1940 and March 31, 1945, the number of persons actually trained totaled 7,369,017, with 2,662,558 in pre-employment courses and 4,706,459 in supplementary courses. Women comprised a sizable group of the total trained, numbering in all 1,474,479. The 554,422 women receiving pre-employment training and the 920,057 receiving supplementary training constituted one fifth of the total enrolled in each of these categories.

A third phase of the program was an attempt to help farmers improve their food production. In 2,600 counties nearly 200,000 courses approved by the Office of Education were conducted by 50,000 instructors, a majority of whom were laymen, in a nation-wide program to better production records. Classes were held in school houses, in factories, or on the farms. The repair of farm machinery, new methods of planting, co-operative soil improvement, and other matters vital to production were taught.

The magnitude of the task that has been accomplished in training war workers is not generally realized. "Schools and colleges have reason to be proud of the task they performed," states the *New York Times* (June 17, 1945). "Almost overnight, they changed from a quiet, peacetime academic program to an accelerated, rapid-pace war schedule. They gave gladly of their services. In time, perhaps, the herculean tasks they performed will be more commonly recognized."

War Services in the Schools.—Breaking all previous records, the purchases and sales of War Savings Stamps and Bonds by pupils and teachers during the session of 1944-45 totaled \$715,000,000. Since Pearl Harbor the school program has resulted in an investment of \$1,767,000,000 in War Bonds, the Treasury department reports. "I congratulate the boys and girls and their teachers for this magnificent contribution to the fight for victory and a just peace," said President Harry S. Truman upon accepting at the White House on July 5, 1945, a plaque, symbolic of the "purchase" of nearly 20,000 pieces of military equipment through sponsorship campaigns conducted by the schools. With the end of the war schools have been asked to continue their war savings programs throughout the session of 1945-46. Fall campaigns featured hospital equipment and medical supplies. Pupils have also played an active part in the various War Loan drives.

Army and Navy Postwar Educational Programs.—Profiting by the mistakes of 1917-18, army authorities have made elaborate plans for keeping the men occupied after the cessation of hostilities. A poll conducted in the fall of 1944 showed that 57 per cent of the officers and 66 per cent of the enlisted men favored study programs over mere recreation, such as athletics, tours, handicrafts, and dramatics. The basic unit in the educational program is the "command school" planned for a battalion or geographically separate unit of 1,000 men or less. Classes are organized within the unit with instructors drawn from the unit's own personnel. Course outlines based on standard texts were already available, but it was necessary to train thousands of teachers.

During June and July 1945, approximately a thousand men a week completed "teacher-training" courses of one week's duration at special schools in Paris and in England. By November the army planned to have available 22,000 unit education officers, 2,600 instruction officers, and several hundred counselors and other specialists. Each course is broken into blocks of 20 hours each, so that even if a unit is moved suddenly the men will be able to complete at least a segment of the work. Courses range in length from one block of 20 hours to as many as 320 hours. Theater syllabi list 171 courses in four basic fields: agriculture, mechanical and technical, business, and general education. Four million textbooks have already been shipped to Europe.

According to the *New York Times*¹, the Ninth Air Force has more than 50 schools going with 21,000 students. In one bombardment group, the normal complement of one airfield abroad, 1,000 soldiers are attending 83 classes in 30 subjects. One fighter group has 625 men studying. It is estimated by May 1946 there will be 2,200 unit schools with some 1,250,000 men enrolled.

For men interested in collegiate education the army has established three overseas universities, known as University Study Centers. The first of these opened in Shrivenham, England, in July 1945. Courses in agriculture, commerce, education, engineering, fine arts, journalism, science, and liberal arts are offered. Of eight weeks duration, the courses are patterned after those of the typical American university summer session. A similar University Study Center is in operation at Biarritz on the French Riviera in a series of requisitioned hotels and villas. A third center in the nature of a technological institute is

¹ Hill, Gladwin: "Greatest Education Project in History." July 29, 1945.

planned for Wharton, near Liverpool, where the buildings, equipment, and living accommodations of one of the Army Air Forces' largest service depots are now available. Each center will accommodate about 4,000 men. The faculties are composed of both army officers and civilian educators from the United States. Some 300 civilian instructors have been drawn on leave of absence from outstanding colleges and universities in this country.

In addition to the unit schools and the university centers the army program provides for placing about 20,000 men in three months' courses in civilian educational institutions such as Oxford, Cambridge, and the Sorbonne wherever arrangements can be made. One-month courses for 30,000 men in private industrial firms are also planned. Still a fourth type of educational opportunity to be offered is in the nature of specialized training in fields covered by normal army activities. In quartermaster depots and machine shops where specialized equipment is available a variety of vocational courses not offered in the unit schools will be taught. Courses of this kind will be available to 50,000 men.

The navy has a comprehensive program of academic, vocational, and orientation education and training under the direction of the Bureau of Naval Personnel. Since 1942 the Educational Services Program has been steadily expanded to reach a large percentage of naval personnel. Through a Civil Readjustment Program instituted in April 1944, the bureau has actively assisted every dischargee in making the optimum adjustment to civilian life. Unlike the army and the Marine Corps, the navy has relatively few personnel who are concerned only with combat. Most navy jobs are concerned primarily with operations and maintenance, which continue as long as the ships are afloat, regardless of the existence of a state of war. Even upon the cessation of hostilities, the regular duties of the men largely continue. Chief features of the navy educational program are: (1) Counseling and guidance; (2) classes in academic and vocational subjects; (3) correspondence courses through USAFI; (4) testing and accreditation to civilian schools; (5) hospital rehabilitation; and (6) work in redistribution centers. Education service officers are stationed at all naval activities of over 2,000 personnel.

Educational Plans of Veterans.—Interest is widespread in the extent to which veterans will take advantage of the educational provisions of the Servicemen's Readjustment Act of 1944, commonly known as the "GI Bill of Rights." While numerous samplings have been made, perhaps the most authoritative report yet to appear is a bulletin entitled *Data for State-wide Planning of Veterans' Education*, by Ernest V. Hollis, principal specialist in higher education, U. S. Office of Education (Bulletin 1945, No. 4). Based on data supplied by the War Department and other agencies, Dr. Hollis' survey shows that most veterans want new or better jobs when they return to civilian life, especially the younger men. According to the War Manpower Commission, less than one fourth of the men and women who have been separated from the armed forces have returned to their old jobs.

It is estimated that approximately a million (7 per cent) of the total number of men and women in the services expect to return to school or college for full-time work. Another 2½ million (14 per cent) are interested in part-time study. However, many factors influence the number who

will actually enroll, chief among which are age, previous schooling, marriage, and business opportunities. When only men under 25 years of age, single, with the necessary previous education are considered, the number of prospective students is reduced at least one fifth. It is felt that a generous estimate of the number who will enroll for full-time collegiate education is 650,000 men.

In general, the more education a man has had before entering the service, the more interested he is in further schooling. According to reports compiled by the Veterans Administration, four fifths of the men now receiving educational benefits under the GI Bill of Rights are studying in colleges, and one fifth are pursuing vocational courses of less than college grade. It is significant that only one fifth of the veterans enrolled in college are studying an arts and sciences program; four fifths of them are enrolled in professional and technical curricula.

College Enrolments.—According to Dr. Raymond Walters' annual survey² of college enrolments, full-time students in 679 approved higher institutions in 1944-45 totaled only 608,750; the inclusion of part-time students raises this total to 925,084, or nearly one third less than the number reported in the fall of 1939. Despite fairly large freshman classes of 16- and 17-year-olds, the wartime enrolment of men students has dropped from 50 per cent to as much as 94 per cent in some institutions as compared with 1939. A comparison of 1944 fall enrolments (593,271) with those reported by the same institutions in 1943 (817,759) reveals a loss of 224,488 full-time students. However, 363,000 of the full-time students reported in November 1943 were trainees in army and navy units. In the fall of 1944 the number of army trainees was less than one fifth of the number the previous year. Navy trainees decreased 11 per cent.

In December 1943, Dr. Walters reports, army trainees in approximately 350 colleges and universities reached a peak of 235,000 men on active duty and 2,900 reserve students. Of this number, 145,000 were enrolled in various divisions of the Army Specialized Training Program; 2,900 in the Enlisted Reserve Corps; 80,000 in the Army Air Force; and 10,000 in miscellaneous categories. By the fall of 1944 the number had dropped to 40,830 in the 138 institutions being utilized, plus 560 men receiving specialized AAF training. In December 1943, the navy had a total of 125,935 personnel enrolled in 130 higher institutions. (The maximum of 138,136 was reached in July 1943.) In the fall of 1944, the same 130 institutions enrolled 113,531 navy trainees, divided into 27,267 navy instruction, 47,090 college instruction, and 39,174 split instruction.

Enrolment of women students has reached new peaks. In the 671 institutions surveyed by Dr. Walters, 60.2 per cent of the students enrolled in 1944 were women. In the large universities, approximately 55 per cent of the students were women; in the 421 liberal arts colleges reporting, women constituted 74 per cent of the student body.

Freshmen enrolments in the fall of 1944 showed an encouraging increase. Approximately 60,000, 16- and 17-year-old young men entered college, an increase of 14.4 per cent over the civilian freshmen in 1943. The number of women entering the freshman year increased 17.9 per cent.

² Walters, Raymond: "Statistics of Attendance in American Universities and Colleges, 1944." *School and Society*, Dec. 23, 1944, pp. 402 ff.

Effect of War on Colleges.—Rather complete data on college enrolments, receipts, expenditures, etc., in wartime are available in a special report published by the Committee on Education, House of Representatives, under the title, *Effect of Certain War Activities Upon Colleges and Universities* (79th Congress, 1st Session, House Report No. 214; Government Printing Office). Francis J. Brown directed the study, assisted by an outstanding advisory committee and staff. Limitations of space preclude more than a few brief comments on this comprehensive report. Resident college enrolments of civilian students in 1944-45 are estimated to total only 53.8 per cent of the 1939-40 enrolments (See table). Of course, the greatest decrease has been in the number of men attending. College faculties are 90 per cent of their 1939-40 strength (men, 83.7 per cent; women, 108.0 per cent). Income from student fees is 64.5 per cent of the 1939-40 figure. Expenditures for educational and general purposes are 115 per cent of the 1939-40 amount. This study makes clear the weakened financial condition of many of our colleges and universities. It indicates strongly that some type of federal assistance may be needed.

The discussion of the issue among college presidents has been especially lively. In an open letter to President Roosevelt released Jan. 31, 1945, twelve university presidents (Conant, Hutchins, Dodds, Day, Sproul, and others) urged that no action be taken on the proposal "until the postwar international situation is clarified." Only eight days later, fourteen other college presidents (Compton, Gates, Seymour, Hopkins, and others) released an open letter to President Roosevelt urging immediate action on the proposal.

At the annual meeting of the Association of American Colleges in Atlantic City, Jan. 10-12, 1945, Gen. George C. Marshall made an informal but excellent presentation of the case for compulsory military training. Nevertheless, the association went on record officially as opposing the taking of any action at this time.

A questionnaire poll of college and university presidents, conducted jointly by the American Council on Education, the American Association of Junior Colleges, and the American Association of University Professors produced 1,196 replies. Over three fourths of the respondents favored delaying any action in the proposal for the pres-

Compulsory Military Training.—The advocacy by military authorities of a program of a year's training in peacetime has resulted in much heated debate among educators. Practically every professional journal has devoted at least one feature article to the subject, and there has been a vast amount of editorial correspondence on the subject.

Opposition to the proposal for compulsory military training has been strongest on the part of educational and religious leaders. Yet congressional forces favoring the bill are powerful. Space prevents a summary of the arguments for and against the idea. An excellent statement appeared in *Educational Leadership*, October 1944. Strong arguments for or against the proposal have appeared in successive issues of *School and Society*. An authoritative presentation of the issues involved appeared in the winter 1944 issue of the *American Association of University Professors Bulletin*.

ent. Asked also their feelings if a decision had to be made now, 47 per cent of the presidents were opposed to universal military training, 38.3 per cent were in favor of it; 11.9 per cent were "uncertain," while 2.8 per cent failed to answer this question.

Since the advent of the atomic bomb and the cessation of hostilities, many persons feel that the issue of compulsory military training is a dead one, for, they argue, with such a weapon in our hands only a relatively small army of specialists is necessary. However, general opinion seems to favor postponement of any definite action until the whole situation is a little clearer.

Harvard Report on General Education.—Widely acclaimed as one of the most important educational documents in recent years, *General Education in a Free Society*, the report of the Harvard University committee, appointed by President Conant, was published in July 1945, in a 267-page volume. For two years the committee of

twelve professors, headed by Dr. Paul H. Buck, dean of the faculty of arts and sciences at Harvard, conducted its investigations. Conferences were held with scores of America's leaders in education, business, and industry, who were brought to Cambridge for meetings with the committee. In order to make possible such an ambitious study, the University relieved members of the committee of teaching duties and made available \$60,000 for their expenses. The committee was asked to study the place of education in a democracy and prepare a blueprint for American education on both high school and college level. The resulting report is a clearly-written examination of the question, What should be taught in our schools and colleges? A comprehensive program covering both high school and college is suggested.

The Harvard report is in essence a plea for greater emphasis upon "general education" at all levels of instruction. As the committee uses the term it is almost synonymous with "liberal education." It is the sort of education designed to give the individual an insight into the finer things of life, to impart an understanding and appreciation of our common heritage, and to develop well-balanced, emotionally adjusted personalities. General education is regarded not so much as a series of books to be read or courses to be pursued as a concern for certain goals of knowledge and outlook, and an insistence that these goals be sought after as diligently as those of specialization. Education is concerned with the whole man, not his reason alone. Yet the whole man is integrated only in so far as his life is presided over by his reason. "While we thus regard the cultivation of the mind as the chief function of the school, we view reason as a means to the mastery of life; and we define wisdom as the art of living."

The committee recognizes that its recommendations with reference to Harvard cannot be achieved unless tied in with the needs of American education as a whole. Therefore, it outlines first a comprehensive program for the secondary schools. American high schools have become too largely concerned with special education, the committee believes. It recommends that at least half, and preferably three fourths, of the student's time be devoted to general education, consisting of a "core" curriculum built around English, social studies, and science and mathematics. Each student, regardless of his future plans, would be required to spend at least half his time in these three areas. He would be urged to complete twelve of his sixteen units in the area of general education, leaving the remainder of his time for special training in business, agriculture, home economics, or any of the other practical fields.

At the college level the committee again recommends a better balance between general and specialized education. Challenging the elective system introduced at Harvard by President Eliot in the 1890's, the committee recommends that in the future all students be required to take six of the sixteen courses for the bachelor's degree in general education. At least one of the required courses would be in the humanities, one in the social sciences, and one in the natural sciences.

Of special interest are the committee's recommendations for new courses designed to attain the goals of general education. In the humanities it suggests a required course called "Great Texts of Literature," in which the student would gain the fullest understanding of the text studied. Eight books are suggested, chosen from Homer, Plato, the Greek tragedies, the Bible, Virgil, Dante,

Shakespeare, Milton, and Tolstoy, but flexibility is emphasized.

In the social sciences the committee proposes a required course called "Western Thought and Institutions," whose central purpose would be the study of the institutional and theoretical aspects of our Western heritage. Other courses suggested in this area are "American Democracy" and "Human Relations."

In the natural sciences the committee recommends two basic courses in the principles of the physical sciences and the biological sciences. Emphasis would be placed upon the nature and evolution of scientific thinking.

The committee warns against placing general and special education in competition with each other. General education is regarded not only as a background for the choice of a specialty but as "a milieu in which the specialty can develop its fullest potentialities." The complete report, published by the Harvard University Press, merits careful reading and study. It is likely to have a profound influence upon American education.

United Nations Charter Recognizes Education.— Shortly before the opening of the San Francisco Conference on April 25, 1945, the U. S. State Department invited 42 voluntary national organizations to send one consultant and two associates to advise with the American delegation. Four major educational organizations were represented: the American Council on Education, the National Education Association, the American Association of University Women, and the National Congress of Parents and Teachers.

As a basis for definite action the American Council on Education canvassed delegates of its 59 member organizations requesting their views. From their replies, it was evident that there was a strong sentiment for the establishment of an international office of education and cultural relations and for the provision of such an organization at the San Francisco Conference if similar provisions were made in the fields of health and labor.

Consequently, the executive committee of the American Council, headed by its president, George F. Zook, meeting in Washington on May 4, 1945, prepared resolutions strongly favoring an international office of education and sent copies to each member of the American delegation. Other educational organizations and institutions sent similar communications.

In a bulletin issued by the council tracing the progress of the proposal, Dr. Zook points out that the Covenant of the League of Nations made no provision for international co-operation on cultural or educational matters, although an International Commission on Intellectual Co-operation was later set up. The original Dumbarton Oaks proposals contained no reference to the place and function of education in the proposed world organization.

At San Francisco there was a protracted struggle to have the words "and educational" added to the phrase "to promote cultural co-operation" as one of the functions of the Economic and Social Council. Finally, the representatives of agriculture, business, and labor joined forces with the educational organizations previously mentioned to support their request for the specific inclusion of "education" in the international charter. In response to the proposals of the four groups, the American delegation agreed to make such a recommendation to the committee. The conference committee thereupon reconsidered its previous action and approved unanimously on May 22 the

proposed rewording as recommended by the United States delegation.

At the same time both the House (on May 22) and the Senate (May 24) adopted resolutions urging participation of the United States in a permanent "international educational and cultural organization." Thus it was clear that the Congress was definitely behind international co-operation in education.

As finally adopted, the paragraph reads ". . . the United Nations shall promote . . . solutions of international economic, social, health, and related problems and international cultural and educational co-operation . . ." The Economic and Social Council is second only to the Security Council. The charter provides that through this body "specialized agencies established by inter-governmental agreement, and having wide international responsibilities . . . in economic, social, cultural, educational, health, and related fields shall be brought into relationship with the United Nations."

Thus the way was made clear for an International Office of Education with official status, once "inter-governmental agreement" had been obtained. On July 31, 1945, the State Department announced that the British government had called an international educational conference to meet in London on November 1. It also released for publication a plan for an "Educational and Cultural Commission of the United Nations," which would form the basis for the discussions at the London Conference.

This plan was prepared by the Conference of Allied Ministers of Education which met in England in 1944, in which American representatives participated. It proposed that the new organization facilitate consultation among educational leaders in all countries, assist in the free flow of ideas and information on major educational and cultural developments, foster educational programs looking to peace and security, and encourage research on educational and cultural problems.

In November 1945, representatives of 44 members of the United Nations met in London to discuss the establishment of the new agency. Delegates representing every major country except the Soviet Union (which declined both general and special invitations to participate) agreed to form a worldwide educational organization to be known as the United Nations Educational, Scientific, and Cultural Organization.

The formation of such an international educational organization is a step of the greatest significance. It has been widely acclaimed as the most important educational development of our time. The possibilities for the development of mutual understanding among nations are enormous.

In a wireless dispatch from London November 18, 1945) Benjamin Fine, of the New York Times, reports that the constitution of the new organization, which was adopted without opposition by the delegates, sets forth a number of fundamental principles: World peace can be attained only by developing a common faith and confidence. Illiteracy and misunderstanding must be removed. The preamble of this world educational charter holds that "a wide diffusion of culture and the education of men for justice and peace constitute a sacred duty that all nations must fulfill in a spirit of mutual assistance and concern."

The constitution proposes an extensive exchange of scholars, teachers, and educational ma-

terials. Scientific research is to be stimulated, as well as the study of cultural problems relating to peace. The central theme is that the nations of the world can and should work together to improve the cultural life of all peoples.

The new organization is to open headquarters in Paris. It is one of the specialized agencies provided for in the Charter of the United Nations. The first meeting of the organization was scheduled for May 1946. In the meantime, a special preparatory commission will be at work.

Dean, Mary Washington College of the University of Virginia.

EDUCATION ASSOCIATION, National. See NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES.

EDWARDS, Gus, American song writer, actor, publisher, and producer: b. Aug. 18, 1881?; d. Hollywood, Nov. 7, 1945. One of the leading talent scouts of the flourishing days of vaudeville, Gus Edwards discovered such successful performers as Eddie Cantor, Groucho Marx, Joe Cook, Jr., Lila Lee, Mae Murray, Earl Carroll, George Price, Milton Berle, George Jessel, Herman Timberg, the Duncan Sisters, Elsie Janis, and many others. He also composed many popular song hits, including *School Days*, *By the Light of the Silvery Moon*, *In My Merry Oldsmobile*, *Tammany*, *When the Roses Bloom Again*, *Don't Cry Little Girl*, *Don't Cry, I Just Can't Make My Eyes Behave* (written for Anna Held) and numerous others.

EGG PRODUCTION. The 1945 egg crop of the United States, according to the Department of Agriculture, totaled 45,709,000,000 individual eggs, as compared with the 1934-43 ten-year average crop of 33,726,000,000 eggs. Iowa was the leading producing state with an output of 3,609,000,000 eggs; followed by Minnesota with 3,106,000,000; and Texas with 2,863,000,000.

EGYPT. A constitutional kingdom of northeast Africa, bounded east and west by Palestine and Libya respectively; the valley of the lower Nile is the only settled and cultivated area. The total area is 186,198 square miles, and the population was estimated in 1942 to amount to 17,287,000. Originally part of the Turkish Empire, the country was a British protectorate from 1914 until 1922, when its independence was proclaimed. A 20-year treaty of alliance signed in 1936 terminated British military occupation of the country, though Great Britain was permitted to retain in the country troops sufficient to safeguard the Suez Canal until such time as Egyptian forces were in a position to do so. Cairo (pop. 1,312,096) is the capital, and Alexandria (685,736) the chief seaport; other large cities include Port Said (124,749), Tanta (95,260), and Mansura (69,036).

Religion and Education.—The majority of the inhabitants are Moslems, numbering approximately 14,552,695. There are 1,303,970 Christians, consisting of 126,581 Latins and Uniates, 1,099,186 Greek Orthodox and Copts (descendants of the ancient Egyptians who adopted Christianity in the 4th century), and 78,203 Protestants. There are 62,953 Jews and 1,076 of other religions.

Education is free and compulsory for all children between the ages of 7 and 12. In 1943-44 kindergarten and primary schools, both government-owned and private, totaled 696, with 120,425 pupils; elementary schools, 1,296, with

277,997 pupils; and secondary schools, 131, with 48,570 pupils. There were also 54 schools, with 13,825 pupils, giving commercial, industrial, and agricultural instruction. Teachers were trained at 8 colleges for men and 8 for women, in 1943-44 the former having 998 students and the latter 932. El Azhar University, principal institution of higher learning in the Moslem world, is located in Cairo. At the capital, also, is the University of Fuad I, a government institution which had 8,179 students (394 of them women) in 1943-44; at Alexandria was the University of Faruk I, founded by the government in 1943, which had 2,049 students (63 of them women).

Government.—King Faruk I (born Feb. 11, 1920) succeeded to the throne on April 28, 1936. He is assisted by a council of ministers (Mahmoud Nokrashy Pasha became prime minister on Feb. 25, 1945) appointed by him but responsible to a bicameral legislature; the Senate has 147 members, two fifths of whom are appointed by the king and the remainder elected for 10 years; and the Chamber of Deputies has 264 members elected for five years. State revenues for the fiscal year beginning May 1, 1944 were estimated at £E72,690,000, and expenditures at £E76,689,000, leaving a deficit of £E3,999,000 to be covered by the government's reserve fund; the deficit represented the sum required for the first part of the country's new five-year plan. Total receipts at £E72,690 were an increase of 11.8 per cent over the figure of £E65,000,000 estimated for the 1943-44 fiscal year. The consolidated debt on May 1, 1942 stood at £E86,954,940 and Egyptian Tribute Loans amounted to £E5,751,580, making a total indebtedness of £E92,706,520; the charge on account of these debts in the 1943-44 budget was £E4,101,903.

Production and Industries.—Some 8,450,000 acres are cultivable, this being the fertilizing alluvium brought down by the Nile. Egypt is specifically a one-crop country, the most popular and profitable crop being raw cotton. In 1944, 857,949 feddans (1 feddan = 1.038 acres) were under cotton (20 per cent more than in 1943), and the estimated yield was 4,500,000 qantars (1 qantar = 99.01 pounds), as compared with 3,494,392 qantars the preceding year. The cotton crop estimate for 1944-45 was 197,191 metric tons. For the year ended Aug. 1, 1944, the yield of cottonseed was put at 3,470,204 ardebs (1 ardeb = 267 pounds), and cottonseed oil for the year ended Aug. 1, 1945, was estimated at 69,404 metric tons. In 1944, 708,750 tons of rice were harvested, and 38,108,000 bushels of wheat. Other cereals crops, in 1944 were millet, 773,500 tons, and corn, 1,377,040 tons. Other principal products included onions, chickpeas, beans, flaxseed, peanuts, sesame, and citrus fruits. Sugar production in 1943-44 was estimated at 207,000 short tons. Livestock included 30,896 horses, 12,225 mules, 826,796 donkeys, 1,202,284 cattle, 1,001,124 buffaloes, 30,950 swine, 1,423,772 sheep, 759,794 goats, and 174,054 camels.

The petroleum output in 1943 totaled nearly 9,000,000 barrels, 8.7 per cent more than in 1942; extensive surveys for more deposits are being undertaken. In 1943, 1,001,929 cubic meters of limestone were quarried; phosphate rock and manganese are also mined on a considerable scale. There are also commercial quantities of ochers, sulphate of magnesia, talc, carbonate and sulphate of sodium, nitrate of soda, salt, gypsum, and gold. Plants have been erected during

the war for the extraction of lead from galena concentrates and for the production of metallic and nonmetallic salts.

About 1,000,000 Egyptians are engaged in industry, the numbers so employed having doubled in the last decade. Skins have been tanned, pottery manufactured, and cloth of cotton, mixed cotton and wool, and silk have been woven from ancient times. Brass, copper, and silver wares are made, and other industries include the manufacture of basketwork, cigarettes, furniture, matting, rugs, cement, glassware, chemicals, and foodstuffs. A paper mill was established in 1944.

Foreign Trade.—In 1941, exports were valued at £E22,122,000, and imports amounted to £E33,127,000. The unfavorable balance of trade was only apparent, as the invisible local sales to British and American troops located in Egypt more than made up for the difference. Great Britain was the greatest purchaser of Egyptian goods, and had the largest share of the import trade. In 1944, 6 per cent of the kingdom's exports were taken by the United States, and the latter country's proportion of the imports into Egypt was 13.2 per cent. The Middle East Supply Center, an Allied organization with headquarters in Cairo, relinquished control over a wide range of imported articles on Jan. 1, 1945; shipping tonnage, however, remained extremely limited. By a financial agreement reached in January, Great Britain agreed to make available to Egypt approximately £10,000,000 of hard currencies during 1945 to cover the need for imports from and invisible payments to the United States, Canada, Portugal, Switzerland, and Sweden; Egypt, on her part, agreed to take over the import-licensing program, having freedom to choose her imports within the amount allocated and within the hard-currency countries.

Communications.—There are 3,686 miles of state-owned railroads, including 2,619 miles of main line, 158 miles of branch line, and 909 miles of sidings; and 862 miles of agricultural light railroads owned by private companies. A Nile steamer service links Shellal, southern terminus of the main line, with Wadi Halfa, whence commences the railroad system of the Anglo-Egyptian Sudan. During the war, British military engineers extended the coastal line westward as far as Tobruk, Libya; and a swing bridge constructed across the Suez Canal affords direct rail service, via Palestine, between the Egyptian railroads and Beyrouth, Lebanon, which now connects with the Turkish railroad system. Highways have an aggregate length of 7,000 miles. Egypt is served by a number of major airlines; in 1945 discussions were proceeding between the governments of Egypt and Great Britain with a view to establishing a joint Anglo-Egyptian company to operate airfields and airlines. During the war large military airfields were constructed in Egypt by both Britain and the United States; the Cairo government made it quite clear in 1945 that "such airfields must be delivered to us, or they must not exist in Egypt."

Principal Events.—Although, by 1945, actual war operations had receded far from the borders of Egypt, the kingdom remained vitally affected by them and by the prospects which loomed with cessation of hostilities. The Greek government had returned to its homeland, but the government in exile of King Peter of Yugoslavia still availed itself of the protection of Egypt to carry on intrigues, looking toward a return to Bel-

grade; and Allied governments, and British and American in particular, housed on Egyptian soil many agencies concerned, directly or indirectly, with prosecution of the war. For herself, Egypt was more occupied with charting her postwar destiny, both as a fully independent kingdom and as one of the great Arab leaders of Islam. During January 1945, King Faruk I made a state visit to Arabia, meeting King Ibn Saud at the Red Sea port of Yenbo. They have many problems in common, notably the manner in which to deal with the international rivalry for civil aviation facilities, the insistent desire of foreign companies to seek petroleum deposits, and the situation confronting Palestinian Moslems should controls on Jewish immigration be relaxed. The renaissance of Arab unity which resulted from the royal meeting was shortly to be indicated by the co-operative efforts of the two monarchs in launching the Arab League (q.v.).

On their return from the Yalta Conference both President Roosevelt and Prime Minister Churchill visited Egypt, the former conferring with King Faruk and other heads of state aboard an American warship anchored in Great Bitter Lake, through which passes the Suez Canal. The subjects of their discussion were not announced, but on February 24, shortly afterward, Premier Ahmed Maher Pasha, leader of the Saadist (dissident Nationalist) Party, arose in the Chamber of Deputies to read a royal decree declaring war against Germany and Japan. The prospects of Egypt's entering the war had aroused great antagonism in some political circles with pro-Axis leanings, and culminated in the assassination of the statesman as he walked toward the Senate to repeat the announcement putting the nation into the war. The murderer, Mahmoud Essawy, a 28-year-old lawyer, was sentenced to death on July 28. Eliahu Hakim and Eliahu Bet-Tsouri, the Palestinian Jews who, in Cairo on Nov. 5, 1944, had killed Lord Moyne, British Resident Minister in the Middle East, were sentenced to die on January 18, and on March 22 they were hanged.

On February 25 King Faruk appointed Mahmoud Fahmy Nokrashy Pasha, vice president of the Saadist Party and theretofore foreign minister, to the vacant premiership, and two days later, Parliament having ratified the declaration of war, Premier Nokrashy Pasha was invested with supra-normal powers to maintain order in the event disturbances threatened. In Washington, D.C., Mahmoud Hassan Pasha, Egyptian minister, signed the Declaration of the United Nations on February 28, at the ceremony stating that "the Egyptian people would like to believe that they have done and are doing their utmost to achieve victory, and they like to hope that, by putting their shoulder to the wheel, they will help construct a just peace based on fraternity, equality, and freedom for all." The Egyptian minister was one of the four delegates, headed by Foreign Minister Abdul Hamid Badawi Pasha, who represented the kingdom at the United Nations Conference on International Organization. At San Francisco the Egyptian delegation presented their country's proposals concerning the basis for the postwar international organization; they felt that the Dumbarton Oaks plan would not attain the desired goal of unqualified equality among the nations, and demanded that the sovereignty of all nominally independent states be fully and expressly recognized.

Besides a general aspiration for equal status in international relations, Egypt was specifically con-

cerned with removing all vestiges of foreign occupation and control from the country itself. A large proportion of the 12,000 United States troops remaining in the Africa-Middle East theater were still stationed in Egypt, and near Cairo a unit of the United States Air Forces operated its own great Payne Field. While it was anticipated that the military forces would soon be withdrawn, the Egyptians feared that the United States was hoping to retain legal title to the airport, the finest in the Middle East. More particularly, as stated by the government in a communiqué on September 23, Egypt was seeking revision in 1946 of the treaty of 1936 with Great Britain (which contained a clause that such a step could be taken after 10 years provided both countries agreed) and incorporation into Egypt of the Anglo-Egyptian Sudan (a subject with which the 1936 treaty did not deal). Egypt also wished to obtain complete control over the Suez Canal, and to secure abolition of all financial and economic restrictions—the latter meaning, in effect, freedom of Egypt from the sterling bloc. The Labour government of Great Britain appeared to regard such proposals from the traditionally Conservative standpoint.

Although Egypt had remained neutral in the war against Italy, she was understandably interested in the disposal of the former Italian colonies contiguous to her own territories. Italian Foreign Minister A. de Gasperi represented to Secretary of State Byrnes on Aug. 22, 1945, that his country retain sovereignty over Libya and Eritrea, with a trusteeship system provided for Italian Somaliland, but on September 25 the Egyptian Foreign Minister informed the Associated Press that his government favored complete independence for Libya (or a trusteeship entrusted either to Egypt or the Arab League), and claimed Egyptian sovereignty for Eritrea on the grounds that it was actually a geographical part of the Anglo-Egyptian Sudan. Russia, meanwhile, had made her own bid for Tripolitania and Eritrea, and Ethiopia was also asking for Eritrea and Italian Somaliland, while Britain, whose troops alone had conquered the Italian colonies, had yet to be heard from. Under the circumstances, fulfillment of Egypt's hopes seemed somewhat dubious.

WHEELER B. PRESTON,
Author and Publicist.

EICHELBERGER, Robert Lawrence, United States Army officer: b. Urbana, Ohio, March 9, 1886. Lieutenant General Eichelberger commanded the American Eighth Army in the Philippines under Gen. Douglas MacArthur. On Aug. 27, 1945, after Japan's surrender, he and his Eighth Army were assigned occupation duty in the Tokyo area. A West Point graduate (1909) and a veteran of First World War service, General Eichelberger has been both teacher and soldier. He was professor of military science and tactics at Kemper Military School, Missouri, 1916-17; instructor at Camp Pike, Arkansas, 1917-18; and at the General Service School, Fort Leavenworth, Kansas, 1926-29. From October 1940-January 1942, he was superintendent of the United States Military Academy at West Point, and as such, streamlined the academy's entire curriculum. In June 1942, he was named commander of the 11th Army Corps, and two weeks later, was transferred to the 1st Army Corps command. He was promoted lieutenant general (temporary) in October, 1942, and in January 1943, was revealed as commander of American troops in

Papua. In April 1944, he took part in the Allied invasion of Netherland New Guinea. He assumed command of the American Eighth Army in September 1944, and in January 1945, had overall command of American troops landing on the west coast of Luzon in the Philippines.

General Eichelberger is a graduate of the Command and General Staff School (1926) and the Army War College (1930). He holds the Distinguished Service Cross, Distinguished Service Medal with oak leaf cluster, and the Legion of Merit, the latter given him for his work with the 77th Division.

EIRE. See IRELAND.

EISENHOWER, Dwight David, United States Army officer: b. Denison, Texas, Oct. 14, 1890. General Eisenhower, who in a wholesale shift of top Army and Navy commanders on Nov. 20, 1945, was appointed Chief of Staff of the U. S. Army by President Truman to succeed Gen. George C. Marshall, was supreme commander, Allied Expeditionary Force, for the invasion and conquest of Nazi Europe. On March 29, 1945, he was named head of the United States military government in Germany, one of four Allied commanders in chief given supreme authority over the Reich. On May 6 (Eastern War Time), he accepted the German military surrender, terms of which were formally ratified and confirmed in Berlin on May 8. He attended the first meeting of the Allied Control Council for Germany on June 5. On June 18, General Eisenhower was accorded a hero's welcome in Washington, D. C., and there addressed a joint session of Congress. On July 14, he announced the liquidation of SHAEF—Supreme Headquarters, Allied Expeditionary Force—and revealed that the building occupied by SHAEF's staff would thenceforth be headquarters for the United States Force, European Theater.

A graduate of the United States Military Academy (1915), the Command and General Staff School (1926), and the Army War College (1929), General Eisenhower's first big assignment in the Second World War was that of commanding Allied troops for the invasion of North Africa; he was designated commander in chief of all United Nations forces in the North African theater in November 1942, and as such, directed the Tunisian, Sicilian, and Italian campaigns. His masterful blending of Allied forces into a highly effective military machine, and his natural talents as a diplomat made him the obvious choice for the post of supreme commander of the Allied Expeditionary Force for the invasion of Europe. In December 1944, he was designated general of the army, following congressional legislation creating this new rank. His military decorations include the Distinguished Service Medal (U. S.) with oak leaf cluster, Distinguished Service Star of the Philippines, Knight Grand Cross of the Most Honorable Order of the Bath (Great Britain), Grand Cordon, Legion of Honor (France), Order of Suvorov, 1st class, 1944 (USSR).

ELECTRICAL AND ALLIED DEVELOPMENTS OF

1945. A review of the engineering accomplishments of the electrical industry during 1945 is a story of war and of reconversion to peace. Some plants found reconversion easy—just a matter of slight changes here and there in production lines or products. In most cases, however, reconversion meant major changes. From war production industry learned many new and improved proc-

esses—acquired added precision in production techniques, discovered new basic materials with which to work, evolved machinery of increased power, efficiency, and adaptability. The lessons of war production were not lost, but are reflected in new products developed for industry, commerce, and the home. In the following paragraphs some of the year's developments—including not only electrical but also mechanical, chemical, and allied fields, the references are to products or engineering accomplishments of the General Electric and its associated companies. Covering such a wide range as they do, the references indicate the tendencies in design and construction as well as the general progress in the electrical manufacturing industry as a whole.

Atomic Power.—The atomic bomb was, of course, in itself strictly a product for war, to which the electrical manufacturing industry as a whole contributed mightily. Different concerns were called upon for different items, some of them more or less standard products but others highly special. All were called upon to produce qualitatively, quantitatively, and quickly. Enormous volumes of all kinds of electrical equipment were involved—turbine-generator sets, metal-clad switchgear, high-voltage rectifiers, power and auxiliary transformers, unit substations, cable, motors for blowers and pumps and all sorts of drives, protective and metering equipments, electric furnaces, electron tubes, and still other types of equipment too numerous to mention. And there were the many devices for process instrumentation, many of them engineered completely new, including mass spectrometers, acoustic gas analyzers, ionization counters and timers, valve operators, position transmitters, pin-hole detectors, vacuum gages, dew-point recorders, and many more.

Future Power.—In reviewing the electrical developments of 1945 it is hardly necessary to go into detail about atomic bombs. The radio, the newspapers, and the forum speakers have told all that can be told. There are, however, real reasons why the electrical industry is interested in atomic energy. Fundamentally the electrical industry is in the business of generating and applying power. New sources of energy for electric power are always being sought—the airplane jet engine of the just-completed war is, in a different form, a new source of power for driving electric generators. Atomic energy, too, has its possibilities.

Research scientists and engineers are conservative in what they envision as the future of atomic power. "In the course of time—probably a considerable number of years—several prospective uses of nuclear energy will become technically possible. Whether any or all of them will be economically practical, it is far too early to predict. As we see it today, the most probable utilization of nuclear energy is as a source of heat, which may in turn produce steam or hot gases for use in more or less conventional types of power-generating equipment. Direct conversion from nuclear energy to electric power in usable form seems to us an extremely remote possibility. Were we responsible for conducting the affairs of a central station, or a railroad, or other business in which the generation or use of power is of extreme importance, we should go right ahead with our plans for the years to come on the basis of present-day commercially available sources of energy; namely coal, oil, and water power." This was a statement by Dr. C. G. Suits and H. A. Winne, General Electric vice

presidents in charge of research and engineering respectively.

Power Generation.—A survey of equipments newly delivered or under construction shows that the "average" steam turbine of tomorrow will operate at high pressure and high temperature—with resultant fuel economy—and will drive a 3,600-rpm. hydrogen-cooled generator. There will be more new turbines at pressures of 1,200 pounds and higher, more in the 800- to 900-pound level, and definitely fewer at 600 pounds and lower pressures. Seven eighths of them will be for temperatures of 900° to 1,000° F., and only a few for temperatures below 750° F. Three quarters of all new electric generating capacity, including practically 100 per cent of all large machines, will be hydrogen-cooled in those sizes above the minimum for which such is economic.

The Essex Station of Public Service Electric and Gas Company of New Jersey will have a tandem-compound double-flow turbine of 100,000-kilowatt capacity at 3,600 rpm. It will be the largest turbine so far contemplated for operation at high pressure (1,250 pound per square inch gage) and 1,000° F. initial temperature.

Gas turbines for industrial applications were in use before the war. All of the know-how unearthed during the war, when gas turbines were developed for aircraft jet and propeller propulsion, is now available to extend the peacetime applications of this new power plant.

Several hydroelectric projects held up during the war were released for production, including the fifth 75,000-kilovolt ampere generator for Shasta Dam and numerous units for other dams. Work progressed on three 90,000-kva. units for Dnieprostroi, USSR, believed to be the largest diameter and heaviest waterwheel generators yet built.

War demands led to a small portable engine-driven a-c generator with peacetime applications on farms, in industry, on construction projects, in communication and transportation. Still another war generator, produced for use on tanks and heavy ordnance vehicles, has possibilities as a power source on large air-conditioned buses and refrigerated trucks.

Transformers.—A power transformer, the first of two 50,000-kva. units, was noteworthy not only because of its size but also because of the many controls required to handle its varying load. Including its 21,000 gallons of oil it weighs 452,000 pounds and measures approximately 33 by 22 by 33 feet; it is one of the largest transformers built in recent years. Because of varying system conditions, two load-ratio-control equipments are required.

Detachable forced-oil coolers, easily removed for shipping, greatly reduced the required amount of radiating surface compared with conventional self-cooled radiators. Distribution transformers were given a new sealed-tank construction in which cover gaskets of special synthetic rubber are firmly compressed between tank flange and inside rim of the cover, preventing entrance of moisture and thereby improving service continuity.

Switchgear.—Outdoor oil-blast circuit breakers achieved additional compactness, chiefly by reason of a new, smaller interrupter, a new sealed bushing, and a rearrangement of the parts. Air-blast circuit breakers for large power stations were given better interrupting and operating characteristics by introduction of an improved arc chute and interrupting element. Currents with a rate of rise of 7,000,000 amperes per sec-

ond were interrupted satisfactorily by a new rectifier anode circuit breaker, so rapidly that current-limiting action is provided within $\frac{1}{2}$ cycle ($\frac{1}{120}$ second) after a current reversal of the anode circuit.

Unit Equipments.—Mobile unit substations were streamlined, and their weight lessened to meet highway specifications of most states. By the end of the year equipments were in use in half of the states, as well as in outlying possessions and in foreign countries. The many highly successful applications of the units in helping to rebuild war-devastated areas of Europe emphasized their peacetime applications in re-establishing service interrupted by fire, flood or hurricane, or during system change-overs or overhaul of regular substations, and to handle seasonal overloads or large temporary requirements.

To help get coal mines back into service after the Germans were driven out, several low-height portable substation units were sent to Norway. Mounted on small metal wheels for narrow-gage mine rails, the units are rated 150 kva. at 50 cycles, weigh only 5,200 pounds complete, and are only 42 inches high.

One of the many war projects about which little was published were the four 30,000-kw. steam-turbine floating power plants, built for the War Department as emergency portable power plants available for expected power shortages in critical manufacturing areas. The barges were designed for inland water use through canals and rivers; are 318 feet long, 50 feet beam, and 9 feet draft; and have smoke stacks and other deck equipment removable for low bridges. Three of the barges went overseas for use during initial stages of rehabilitation. They went into 50-cycle territory, so their 60-cycle equipment underwent changes before they were sent abroad.

Rectifiers.—An interesting application of large pumped ignitron rectifiers was made at an eastern steel company hot-strip mill, where rectifiers of 7,000 kw. capacity at 600 volts were successfully paralleled with as many as six 1,500-kw. d-c generators.

Lightning Arresters.—A research program investigating all the corrosion influences that might affect operation of pellet-type lightning arresters led to several improvements assuring elimination of moisture and corrosion effects and thus providing more constant performance.

Capacitors.—There were some really small capacitors made during the war. One in particular was a lectrofilm tubular capacitor, a number of which went into each VT or variable time fuse, a miniature radio set in the nose of a projectile that exploded when near its target. Lectrofilm is a synthetic dielectric material developed during the war and used for certain applications for which only mica was previously considered suitable. These VT capacitors, which became familiarly known as "matchsticks", will have postwar applications in compact, lightweight electronic equipment such as FM radios, radar, hearing aids, television, automatic controls, and a host of similar products.

Cable.—Over 100,000 feet of high-voltage cable insulated with butyl high-voltage compound went into service during the year and established excellent performance records. High-pressure gas-filled cable for use up to 138 kv., in either ducts or pipes and suitable for 200-pound operating pressure, was made available.

Operation PLUTO (Pipe Line Under The Ocean), one of the Allies' secret weapons in the invasion of Continental Europe, was the means

for getting a million gallons of so-essential gasoline each day from England to France, without use of highly vulnerable tankships. It was a group of twenty 3-inch oil pipelines laid under the English Channel. One type of the pipe resembled a submarine electric power cable in its construction with, of course, the conductors and core omitted. General Electric was one of four American concerns that produced miles of this nonelectric product.

Motors.—Tri-Clad design, originally applied in 1940 to open (drip-proof) a-c motors was extended during the year to totally enclosed fan-cooled motors in standard and explosion-proof types from one to 300 horsepower. Tri-Clad open motors were extended to 2,000-hp., considerably above the previous largest 300-hp. squirrel-cage induction and 75-hp. wound-rotor types.

Motors with speed regulation within $\frac{1}{2}$ of 1 per cent, using conventional d-c shunt winding, were applied in large numbers during the war for radar, communication and other purposes. More accurate control, down to $\frac{1}{10}$ of 1 per cent was also furnished, using amplidyne-type motors.

Control.—Maxspeed adjustable-voltage control, previously used for crane hoists and similar equipments, was applied advantageously during the year to winches on cargo vessels. The new control system eliminates the necessity for large, centrally located conversion equipment, simplifies power wiring, and has as good—and in some respects better—hoisting and lowering characteristics as the customary d-c system.

Welding.—The welder-jeep, which furnished fast and mobile arc-welding service for the army, has been adapted for civilian use, particularly for construction jobs, industrial plants, utilities, and mining properties. It is easily portable and carries its power to the job. An a-c welder designed for electric cutting and welding on shipboard features unusually light weight and dimensions to go through small hatches and doorways. Technique and equipment to weld light metals and alloys with the inert-arc process were improved, and the process used to weld aluminum, magnesium, and stainless steel on a commercial basis. Particular attention was given to the welding of light metals without a flux. An electronic synchronous precision weld timer, including electronic heat control, was made available.

Heating.—Higher temperatures than can be obtained with other metallic-resistance furnaces were attained in several rotary-hearth furnaces in which the heating units are rods of pure molybdenum, formed into loops and supported by refractory insulators built into the inner and outer walls of the heating chamber. Operating at temperatures up to 2,500° F., the furnaces were applied to the heating of stainless steel parts for forging, heat treating of alnico magnets, and of other special alloys. A protective atmosphere prevents oxidation of both the work and the molybdenum units.

More than 30 large electric brazing furnaces had a war job in the production of M-69 and M-74 incendiary bombs. Trayloads of casings, double-decked for good loading efficiency, were passed through the roller-hearth conveyor-type furnace.

Construction Machinery.—A significant trend was noticeable in the field of construction machinery, with extended electrification of mobile asphalt, gravel, and other aggregate-handling plants, and of heavy earth-moving machines. The complexity of chains, belts, gears and clutches, with unavoidably high maintenance expense, is

giving way to unit electric drives. Mobile generators driven by combustion engines supply the power for the drives. Simpler and safer operation, lower cost, and more uniform output are attained. The generator also provides for lighting of the plant and area, making 24-hour operation possible.

Steel and Aluminum.—The steel and other metal industries have many new and interesting possibilities for speeding up and modernizing their processes. Some cold-reduction mills operate at speeds as low as 150 feet per minute; there is one with a speed of 3,850 fpm. Its record-breaking production of high-quality on-gage strip has focused the industry's attention on the need of modernizing and speeding up, or building completely new mills. Single-purpose mills—one mill for tin-plate schedules and another for sheet schedules, for instance—are recommended. In the several new mills and in many others being modernized the application of amplidyne control was conspicuous. Amplidyne adjustable-voltage control was widely applied, in one case practically tripling the speed of pickling lines.

Petroleum.—The wartime-developed electro-hydraulic governor for Diesel engines was applied advantageously to a large Diesel engine oil-well drilling equipment, built for exploratory drilling to 15,000 feet. Its three 375-kw. Diesel-driven d-c generators may be paralleled to supply the 1,000-hp. draw-works motor or may be individually operated to supply the mud-pump, rotary table, and coring-reel motor. A new governor makes it possible to run the engines at the speed called for by the driller instead of at continuously top-rated speed; prevents engine overloading by automatically reducing the generator field; and controls all three engines from one driller's master switch, with the governors causing the engines to divide the load automatically when they are paralleled. All these features greatly reduce maintenance and fuel consumption.

Chemical Industries.—A motor—or any other electric equipment—in a powder plant must be explosion-proof. "Wringer" motors supplied for centrifuging nitrated cotton had their vertical shafts designed to take the weight of the wringer basket. The magnetic control, including the secondary resistors, is completely oil-immersed.

Mining.—Open-cut mining at the unusual depth of 40 to 70 feet was made possible by a walking electric dragline in an Indiana coal strip mine which about once a minute removes 25 cubic yards of rock and earth overburden from coal deposits. In common with other large excavators supplied with electric equipment during the year, this machine uses amplidyne control equipment for all motions. To the ever-growing list of large d-c mine hoists incorporating the amplidyne exciter system there were several additions, including the first fast coal mine hoist so equipped. That hoist carries $4\frac{1}{2}$ tons of coal up each trip from a depth of 487 feet, and is rated to make 167 trips per hour.

Rubber.—Several interesting engineering developments were recorded in sectional drives for rubber, linoleum, plastics, and similar industries. In the tire industry, for example, where line-shaft drive was previously the conventional type, a complete electric sectional drive was being introduced for a four-roll calender with processing auxiliaries. One advantage of the new drive will be that it permits measurement and control of tension throughout the calender processing line. A large sectional drive being built for a new

linoleum-making process consists of mills and mixers which compound the linoleum plastic and color it with variegated effect, and calenders which roll it on burlap backing. Then it is baked, in sheet form, and wound up. The electric control provides a constant-speed regulating system operating over a 32:1 range, determining the compounding and coloring of the mix and the calendered gage. In addition, constant-tension control is supplied in certain sections for handling the final sheet.

Lumber.—A 1,500-hp. synchronous motor, about three times the size of any synchronous motor built previously for such service, was direct connected to a wood chipper, the disc of which is 175 inches in diameter and which carries four radial knives on its face. Logs up to 40 inches in diameter are handled at a rate of a foot per second.

Textile.—By pre-stretching rayon cord almost to its limit and setting it at that point it became possible to produce better synthetic rubber tires. The necessary co-ordination of the speeds of seven motors used in the process was accomplished by use of a drive incorporating Thy-motor motor control to maintain preset tension values and to accelerate and decelerate the motors smoothly.

Machine Tools.—Almost anything that can be cut from a pattern or template with a motor-driven tool can be produced accurately and completely automatically with a machine equipped with a new automatic contour control system which literally has a "sense of touch." When a change in pattern contour is encountered by the tracing stylus, the two feed motors change speed simultaneously as required to reproduce the same contour on the work in the machine. Motion of the tool across the work is continuous and at a constant rate, and tool marks are evenly spaced regardless of the direction of travel of the tool, insuring a good finish. Machines equipped with such control turned out many complicated parts for turbosuperchargers and jet engines during the war.

Farm Industry.—A new floating de-icer designed for keeping water continuously available for livestock in the cold season, works equally well in any size tank, insulated or not. Little of its heat is dissipated through the water—the heat is only to keep the float free from ice so the livestock can nose down to drink. For barn hay-drying installations, which add so much to the value of hay, an improved co-ordinated control set was developed. The set is easily installed, and is positive and versatile. It is possible also to use the motor for hoisting hay, filling silos, sawing wood or operating a refrigeration compressor when not required for hay drying.

Farm and rural distribution systems—not to mention farm wiring itself—previously limited the use of arc-welding equipment on the farm because of the power demand of the equipment. An arc welder featuring low power demand was developed in two ratings for farm and workshop use. Heat, ventilation, and germicidal irradiation of air so necessary for raising healthy chicks were incorporated into a brooder unit supplied ready for installation in a hover.

Aviation.—Among officially announced planes of 1945 were the Lockheed P-80 *Shooting Star* of the army and the Ryan FR-1 *Fireball* of the Navy, both of them jet-propelled. The *Shooting Star*, an escort fighter and interceptor, is the fastest fighter airplane in the world, with a speed well over 550 miles per hour, maximum altitude

in excess of 45,000 feet, and a long operating range. It is single-engined, and has exceptional maneuverability and fire power. The *Fireball* is powered by a conventional reciprocating engine augmented by a jet engine. Designed as a carrier-based navy fighter, it is the first shipboard fighter to use tricycle landing gear. Its exceptional speed and rate of climb are the result of the use of the jet assist unit in the aft fuselage.

Development of a new type of aircraft power plant, which through two-way harnessing of a gas turbine drives a propeller and boosts with jet thrust simultaneously, was also announced. Power generated by such units is already great, and engineers see no basic difficulties in increasing the propulsive output of this type of gas turbine to almost any amount visualized as necessary to drive projected mammoth planes of the future—it is generally agreed that the size and power developed by conventional reciprocating engines is reaching the peak which can be attained without prohibitive complexity. The new gas turbine may not give the speed of planes like the *Shooting Star*, but it will give ranges greater than may be possible with pure jet propulsion.

Following up on the success of the turbosupercharger-pressurized cabin of the B-29 Superfortress, a cruising turbosupercharger was under development for postwar aviation, to permit operation of commercial airplanes at higher altitudes with reduced fuel consumption and to condition cabin air. Such a cruising turbo will be smaller and lighter than those on war planes since it will not be called upon to provide full-power airflow except at low altitude.

Automatic engine control was introduced to permit the pilot to operate the power plant from one lever in the cockpit rather than using throttle, propeller control and boost control separately. This and the turbosupercharger regulator, similarly automatic, were applied to the Republic P-47N Thunderbolt and other aircraft.

Marine.—Outstanding in the field of Diesel-electric propulsion equipment was a development in the insulation of the rotating apparatus. Indications are that it will be possible to obtain a 40 per cent increase in output within the same space and weight limits. Sectional floating dry-docks went into service in the Pacific, giving the navy "repair bases today where yesterday there was none." The sectional construction permits the units to be towed, with wing walls down, to a protected location as close to combat zones as advisable, and there assembled and put into service. Placed together, 10 of the sections will float a battleship, 7 will care for a cruiser. As the sections are joined mechanically they are also tied together electrically, with synchronizing facilities provided for multiple operation of any number of sections. Because each section is a complete unit in itself, as well as a "hotel" for the men who comprise the service crew, large amounts of electricity are used. This is supplied by Diesel-driven generators on each section, and is used to operate machine tools, cranes, welders, anchor windlasses, hoists, blowers, compressors, ventilating and refrigerating units, and pumps for emptying and filling buoyancy compartments. The docks are equipped to supply the vessel under repair with both a-c and d-c service.

Railroads.—First locomotives of any type to carry a million pounds on the drivers will be the four which the Virginian Railway is obtaining for its heavy coal-haulage operations over the Allegheny Mountains. These motor-generator locomotives, using 11,000-volt, 25-cycle single-

ELECTRICAL AND ALLIED DEVELOPMENTS

Manual helium-shielded-arc welding being done on light-gauge magnesium plate. The inert-arc welding process is ideal for light metals and alloys.

phase power, will be constructed as two cab units, with all weight on a total of 16 driving axles. Among other large electric locomotives for several railroads are two for the Great Northern which will be the largest single-cab locomotives ever built, to be used on the electrified Cascade Tunnel section of that road. They will have a knuckle-to-knuckle length of about 100 feet and will weigh 360 tons, with all weight on the drivers. A complete 6,000-hp. Diesel-electric locomotive developed for Fairbanks Morse and Company consists of three single-engine units, each weighing 160 tons, all on six axles. The trucks are of all-welded construction.

Rapid Transit.—Two 1,000-kw. 600-volt mercury-arc rectifier substations installed by the Honolulu Rapid Transit Company marked the first application of sealed ignitron tubes for railway substation service. They were also the first stationary outdoor installations of sealed tubes. Another "first" for railway power supply will be the 24-phase, 1,500 kw., 600-volt sealed ignitron mercury-arc rectifier substation of the Chicago and North Shore Railway. Multiphase operation, patterned after existing large industrial power applications, was used in this relatively small installation to avoid interference with communication circuits.

Testing and Measuring Equipments and Methods.—Conspicuous among new testing equipments was the largest and highest-speed electrical power absorption machine, under construction for use in gas-turbine development programs. The largest and fastest model-boat towing-bridge laboratory was being supplied with unusual equipment. The largest electrical low-speed dynamometer was designed for testing turbine-propulsion units for future ships.

The variable-density wind tunnel put into operation by Curtiss-Wright Corporation in Buffalo contains the most highly flexible range of testing conditions in the country and will help bring into being a flying ship closer to perfection than would be possible without this testing technique.

Meters and Instruments.—Far-reaching possibilities are seen for improved measuring devices in a new method for suspending moving elements magnetically. The availability of comparatively new magnetic alloys which can maintain strong and stable magnetic fields in small space led to the development of such suspension. Counteracting the force of gravity, it promises negligible mechanical friction and long-time service. Many new meters, instruments, calibrating and measuring devices were produced during the year. Interesting construction was incorporated in many of them. Studies of smoke, powders and pigments, as well as surface phenomena which cannot be studied by X-ray diffraction because of the greater penetration of X-rays, were provided for with an electron diffraction instrument.

X-Ray Equipment.—The year 1945 marked the 100th anniversary of the birth of Roentgen; and the 50th anniversary of his discovery of X-rays. Four 2,000,000-volt industrial X-ray units were in service at the end of the year, and another was scheduled for early installation. The one at the Elwood Ordnance Plant near Joliet, Ill., was particularly outstanding. It was used for continuous X-raying of conveyORIZED 250-pound bombs and 8-inch shells on the main floor, using the reflected beam, while simultaneously 240-mm. shells and 1,000-, 2,000- and 4,000-pound bombs were X-rayed in the basement, using the transmitted beam. The equipment al-

most entirely eliminated destructive testing, which not only ruined the shell or bomb but was inadequate for detecting defects not near the plane of cross-section.

Peacetime trends as well as wartime uses were illustrated by new applications of the 1,000,000-volt industrial X-ray equipment—in the examination of jet-propulsion components by General Electric, the inspection of heavy armor plate by Pressed Steel Car Company at Chicago, of heavily armored combat vehicles by General Motors at Grand Blanc, Mich., in the development of combat vehicle armor plate at the Rock Island Arsenal, and in the construction of crude-oil fractional-distillation apparatus.

X-ray diffraction equipments continued to find expanded fields of application in research and control laboratories. Chiefly they went into the oil industry, in connection with investigations into the properties of catalysts; the control of ceramics processes; metallurgy, especially in the use of new high-temperature alloys; and organic chemistry, particularly in the control of the production of natural and synthetic yarns and synthetic rubbers.

In medical X-ray equipment a major engineering advance was made with the redesign of photo-roentgen apparatus so that it can be taken apart or assembled by two men in a half hour, without use of tools.

Electronics.—A new field for electronics announced during the year was radar—announced not because it was brand new then but because previously it was a guarded secret. Growing out of extensive research and production of radar equipment for war applications, the electronic navigator—a shipboard equipment for commercial vessels—was the first peacetime application of radar. It will revolutionize thick-weather navigation, providing the mariner with an instrument to pilot a safe course, even though his normal visibility is strongly limited by natural conditions. The equipment can detect through darkness, fog or storm the position of any above-water obstacles, such as lighthouses, buoys, icebergs, other ships, and land, up to a distance of 30 miles depending on the size of the object.

Radio Transmitters.—A two-way radio, weighing only 15 pounds complete, was designed for private aircraft, to permit the flyer to use the radio range system for navigation; to communicate with airport control towers and range stations for weather, flight and landing instructions; and to enjoy broadcast reception. Pioneer installations of two-way frequency-modulation radio equipment were made in buses and taxicabs. Quick communication between operator and headquarters facilitates schedules and solutions of emergencies. Frequency-modulation broadcast transmitters were redesigned specifically for the newly allocated high-frequency bands; and the FM circular antenna changed so that one element, or doughnut, is within the other, thus lessening wind resistance.

Radio Receivers.—Production of home radio receivers was resumed during the final quarter of 1945. Alnico V, two and one-half times as powerful as the best available prewar magnet material, was applied in new loudspeakers, making them lighter, more compact, and more sensitive. Improved sensitivity, frequency response, and permanence of alignment resulted from adoption of molded diaphragms for speakers, preformed directly from wood pulp and pressed into final shape between hot dies. The former was not forgotten. Included in the new receivers were

two that can be converted readily to a-c operation when the home is electrified. All that is required is insertion of a rectifier tube.

Carrier Current.—Frequency modulation, applied commercially to power-line carrier current for the first time during the previous year, was expanded in 1945 to improve and extend the distance of transmission of all types of carrier-current voice-communication. The improved discrimination against noise obtainable through FM also made feasible the design and successful application of mobile carrier-current communication for electric utilities and railroads. The adaptation of crystal filters and oscillators to FM frequency-shift equipment brought about still further improvements in transmitting range and in noise reduction, and increased the available number of carrier channels for telemetering, load control, and similar services that require transmission over unusually long distances.

Electron Tubes.—A triode similar in structure but of higher power than the previously announced "lighthouse" tube was developed as a low-power transmitting tube at frequencies up to 500 megacycles. While similar in structure, it is quite different in appearance; the anode is the larger end of the tube and is fitted with a radiator to dissipate relatively large amounts of power—depending upon the class of service, outputs of from 18 to as high as 40 watts may be obtained from two tubes.

Plastics.—Silicone rubber attained prominence during 1945 as a high-temperature electrical insulation. Production was on a pilot-plant scale, but the material was made available for special applications requiring chemical inertness and ability to withstand temperatures of nearly 400° F. (200° C.). Applications of silicone rubber had previously been confined, because of limited production, to heat-resistant gaskets for war-essential turbosuperchargers and navy searchlights, services where rubber could not withstand the temperatures.

Silicones—unusual chemical compounds in which silicone behaves much as does carbon, its close relative, in organic chemistry—include more than this unusual rubber. There are silicone oils, greases and resins as well, also with unusual properties. Silicone oils, applied in hydraulic applications, have remarkably constant viscosity over a wide temperature range and are so chemically inert that their structure remains unchanged under conditions that would cause petroleum oils to break down. Silicone greases were developed as a lubricant for applications at elevated temperatures or where corrosives are encountered. While closely resembling conventional resins in physical appearance, silicone resins have higher thermal stability, improved dielectric properties, and greater mechanical strength and toughness.

For radar and other electronic devices employing extremely high frequencies, where temperature requirements are above the limit of previous thermoplastics, there was developed a thermo-setting material which only softens to a rubbery gel at high temperatures and which will not flow. No decomposition is noticeable at 392° F. (200° C.), and upon cooling it hardens again without losing its shape—permitting soldering and such operations very close without permanent distortion.

Permafil "solventless varnish," although available in only relatively small quantities, was given extended applications during the year for impregnating, laminating and casting applications,

and as a base for protective coating and compound binders. The uncured material is an easily poured liquid which cures or hardens to a hard, dense solid when heated. The curing is accomplished with practically no volatile loss, particularly important in filling and impregnating applications.

Illumination.—Sunlight, 24 hours a day and independent of the weather, is now a possibility. Through the use of the latest developments in the field of illumination, the sun's radiation has been duplicated in the Lighting Institute at Nela Park, Cleveland, Ohio. Combining the radiation from fluorescent, mercury, sun, and incandescent lamps, engineers were able to produce an artificial sunlight visually indistinguishable from the real thing—complete with tanning and warming effects—but the fact that about 100 kw. of power are required for an area the size of an average private office suggests that artificial sunlight may be restricted to a very few installations in the immediate future.

Using a new phosphor, fluorescent sunlamps were introduced to bring the advantages of sunlight indoors economically. Only standard fluorescent auxiliary equipment is required. One type, for use with poultry, has 75 per cent germicidal and 25 per cent erythral (tanning) radiation. Another type, in 20- and 40-watt sizes for personal use, produce only sun-tanning erythral energy. It is estimated the new 40-watt sunlamp is 15 times as effective per watt of input energy as the well-known S-1 lamp in production of erythral radiation.

Split-second starters for fluorescent lamps were created, eliminating the warm-up period common to most fluorescent installations. Circine fluorescent lamps became the inspiration for new designs of portable lamps for the home and of decorative fixtures in commercial applications. Some lighting engineers estimate that 75 per cent of the uses for the circular lamps will be found in homes.

Development of a new white fluorescent lamp having a color temperature closer to that of daylight than that of the 3,500° white lamp—and more flattering to the complexion than the daylight fluorescent lamp—was announced. It emits more warm red. Also new was a low-brightness, 40-watt, 4,500° white, 60-inch fluorescent lamp which requires less shielding since it has a brightness only slightly more than half that of the standard 40-watt fluorescent lamp.

Christmas tree lamps again rolled from machinery late in the year—machinery which during the war had been switched from the production of cheerful colored bulbs to the deadly serious business of forming a basic part of the radio-operated VT fuse. Mass production of the fuse called for large quantities of a small glass ampoule filled with acid and sealed. Similarity of production problems of the ampoule and Christmas tree lamp was apparent, and the lamp machinery was converted.

Sealed-beam landing lamps for large and small private planes were announced, following their successful war operations. This type of construction, originally used for automobile headlights, was also applied to a lamp for farm tractor lighting and to a clear-glass, shielded filament, spotlight lamp.

The repeating flash tube played a leading role in night aerial photography from reconnaissance planes over enemy territory. Powered by a special electronic source, a coiled quartz tube emits flashes of illumination of an intensity mak-

ing night photographs possible from altitudes up to two miles. Plans for postwar uses of the tube call for applications in airway and waterway beacons, as well as in photography.

A 375-watt heat lamp was introduced as a companion to the standard 250-watt lamp in industrial drying applications, to permit a 50 per cent increase where needed in watts per square inch with the same spacing arrangement.

Air Conditioning.—Air-conditioning engineers became more aluminum-wise, and developed an aluminum air-conditioning cabinet weighing 25 instead of the prewar 45 pounds, which forms the base for a more practical and appealing fine-grain finish that is far easier to clean. A new oil-fired conversion burner has just half the cubic content of the old model, with weight down from 105 to 65 pounds. Gas-fired warm air conditioners decreased 25, 50 and 75 pounds in different models.

The success of such wartime developments as the de-boning and freezing of meats, the freezing of fresh citrus juices, the spectacular growth of popular interest in frozen foods and locker plants opened up a whole new industry within the food industry. Meat packers, canners, fruit and vegetable producers, and dairies entered the frozen food field in increasing numbers. An interesting development has been the growth of frozen food centers in urban and suburban centers, with a trend toward handling commercially frozen food in both urban and rural locker plants.

Appliances.—Shortly before V-J Day it was possible to manufacture refrigerators, portable heaters, electric irons and clocks, and to organize facilities for additional items. Ten days after the war ended, Bridgeport completed its first washing machine. Other items followed rapidly: Vacuum cleaners, ranges, ironers, electric blankets, waterheaters, dishwashers, Disposall kitchen waste units, mixers, toasters, roasters, coffee makers, grills, waffle irons, heating pads, and heat lamps. Within five months after V-J Day the complete appliance line was to be in production. For the most part, however, the first appliances were modified 1942 models not requiring new tools, fixtures or facilities, and not all models were put into production. One style of washer, three refrigerators, three ranges, three ironers and one roaster, for instance, were made. For electric blankets a new single-strand heater wire was developed to replace the prewar multistrand wire. It has a flexing life more than twelve times that of its predecessor.

Lighter in weight and smaller in overall dimensions than conventional nonmetallic sheathed cables, a new type, designated PVX, uses small-diameter, color-coded, thermo-plastic-insulated conductors. It carries higher current than other nonmetallic sheathed cable without exceeding safe operating temperatures.

Research.—"We have now arrived at the stage where we can generate in the laboratory radiations which formerly were available only in the cosmic rays, and we are just passing the borders of an entirely new field of atomic research." This statement by Dr. C. G. Suits, director of the G-E Research Laboratory, referred not to atomic bombs but to the laboratory's 100,000,000-volt induction electron accelerator, or betatron. It went into operation in 1943, but secrecy prevailed on all work related in any way to the field of nuclear physics, so, even though not a part of the atomic bomb project, its completion went unannounced. The new betatron produces X-rays far more powerful than any previously attained,

capable of penetrating a thickness of metal considerably greater than will 2,000,000-volt rays, as well as still other interesting forms of radiation. It also gives greater depth doses of X-ray ionization in body tissue. Creation of matter from energy—reverse of the process in the atomic bomb—can be accomplished with radiation from the new atom smasher. An ordinary half dollar can be made to give off rays like those of radium by a few minutes of exposure to the intense X-ray stream from the betatron, with the silver transmuted to cadmium and to palladium and the copper of the coin's alloy transmuted to nickel. Within an hour or so the electron emission is practically completed. Although the changes involve huge numbers of atoms, they are exceedingly small in proportion to all the atoms in the coin, and no chemical test would detect the cadmium, palladium or nickel so produced. The composition of the coin is not perceptibly altered. The betatron is housed in a special building, with three-foot walls of concrete. Control is necessarily remote, from a neighboring room.

What of the Future?—Forty-five years ago the first industrial research laboratory in the United States was created, at Schenectady, N.Y. Fundamental research before then had been an assignment for the colleges. In 1914 a large laboratory—a showpiece because of its facilities—was built for the Schenectady scientists, and in 1922 another large building was erected. Now plans have been completed for a new, even larger research laboratory, to be located on a 200-acre river bluff site beyond the city limits. The building will have 200,000 square feet of laboratory working space, in addition to an auditorium, library, conference and other rooms. The cost has been estimated at \$8,000,000. It will be here that a staff of 800 will devote their efforts to a very much expanded program for the postwar years, out of which will come added fundamental knowledge, new and better processes and products—and a better peacetime world.

GUY BARTLETT,
General Electric Company.

Note: The foregoing paragraphs were condensed from advance sheets of Mr. Guy Bartlett's excellent article on "Electrical and Allied Developments in 1945" which will appear in full in the January 1946 issue of the General Electric Review, and to which the reader is referred for more complete information on the various topics referred to in this abstract.—Editor.

ELECTRONICS. Since hostilities ceased in the middle of 1945, the bars of military security have been lowered and some of the fascinating stories of the wartime applications of electronics have been told. To the electronics industry, the end of the war meant not only conversion to peacetime radio production but also the application of new techniques and equipment developed during the war-accelerated research to peacetime use. While attention has been focused on radar, radio, and communications, other uses were found during the year for the romantic electronic tube that, although not widely publicized, further advanced the art in industry. Such progress, in one year alone, shows many fields and industries that have benefited by use of electronic equipment: to speed up manufacturing processes, provide exact automatic control, and precise measurement of many factors that have heretofore been almost impossible to determine.

Food Defroster.—An electronic defroster will thaw frozen foods almost instantly while preserving their taste, texture and nutritive quality. The new defrosting method uses an oven in which the floor and ceiling are insulated metal

plates or electrodes that are connected to a high-frequency generator. Frozen food is placed between these plates and is subject to dielectric heating which reaches the core of the frozen substance as well as its surfaces for uniform defrosting. Frozen raspberries, one of the most highly perishable foods, are defrosted in just 11 seconds of elapsed time.

Flaw Detector.—In one New England plant, invisible flaws and inclusions in brass bar stock were causing tool breakage losses amounting to over \$2,000 per week. The problem was solved by installing an electronic flaw detector to inspect all stock before machining. This device detects flaws as short as $\frac{1}{16}$ -inch, many of which are not even noticeable at the surface. In the first six weeks of electronic inspection, not a single tool was broken, tool life was considerably increased, and over-all production increased 60 per cent. The flaw detector consists of an electron-tube oscillator that supplies high-frequency alternating current to a detector coil through which the bar stock is passed at rates as high as 80 feet per minute. If a flaw is present, a sensitive electron-tube indicator circuit signals the operator and actuates relays that stop the machine which pulls the bars through the coil. The detector works equally well on both ferrous and non-ferrous metals and on welded or seamless tubing.

Feed for Ore Crusher.—Two different types of electronic control units are being used in the mining industry to keep ore crushers operating automatically and continually at the peak load corresponding to maximum efficiency. In one type, a microphone is positioned alongside the crusher, and connected to an amplifier and relay combination that controls the conveyor feeding ore into the machine. When the noise level drops to a point indicating that the crusher is running too nearly empty, the electronic ear detects this and calls for ore to be fed in.

In the other type, an electronic eye is used to monitor the amount of electric power drawn by the electric motor which drives the crusher. This power consumption is high when the crusher is fully loaded, and drops as the machine empties. A light source and phototube are mounted over a wattmeter in such a way that the meter pointer interrupts the light beam when the power drops. The phototube feeds an amplifier-relay combination controlling the ore feed mechanism, as before.

Casting of Metals.—In the manufacture of metal electrodes for vacuum tubes and X-ray tubes at Machlett Laboratories, purified copper rod is placed over a mold in a graphite crucible and the whole enclosed within a double-walled quartz-silicon tube. A high vacuum is maintained in the tube. A coil surrounding the quartz tube connects to an induction-heating electronic oscillator. When the oscillator is turned on, the copper melts and flows into the mold. Cooling is precisely controlled by adjusting the position of the heating coil so that crystals form longitudinally for maximum heat transfer under operating conditions. Dimensions of the casting can be held to about 1/10,000 of an inch. No gases can be occluded in the metal of the casting, nor can oxides form.

Centrifugal casting of intricate steel parts produces accurate castings requiring no machining, for high-carbon steels, stainless steel, or almost any other metal desired. One of the major problems, however, has been that of getting the patterns out of the sand mold without dislodg-

ing sand and thereby destroying the fine details of the casting. In a recently developed electronic method, a heavy sheet-metal cylinder serves to enclose the molding sand and a polystyrene pattern is used instead of wood. The styrene is melted out by induction electronic heating applied to the metal cylinder, after which the molten metal is injected into the cavity by centrifugal force. A slow rate of heat of the styrene pattern is required at the start to prevent excessive moisture and alcohol in the sand mix from exploding the mold. The ideal heating process seems to be four one-minute cycles separated by one-minute intervals. The method formerly used required from 1½ to 1½ hours to melt out the styrene.

Seals Metal to Glass.—The metal contact that makes electrical connection to the coating inside the bulb wall in several types of cathode-ray tubes is sealed into the glass by electronic heating. The technique consists of placing the bulb on a fixture that holds a small chrome-iron cup against the inside wall. The cup is placed in the field of a one-turn coil supplied with radio-frequency power from an electronic generator and heated until it drops through the glass, leaving a hole. The contact is then placed in the hole and likewise heated until the surrounding glass flows and seals to the metal. Annealing of the glass removes strains set up during the operation. With the new technique, the whole process takes about one minute, half the time required by the gas-flame method formerly employed.

Phototube in Foundry.—A single operator working from a remote station controls the pouring of several ladles in a foundry simultaneously with the aid of a photoelectric control that automatically tips the pouring ladle back when the mold is filled. Hazards such as heat and splashes of molten iron encountered in hand pouring are completely eliminated and several molds are now poured in less time than was needed to pour one by the former method. As each of the group of empty molds moves into position before a ladle, a photoelectric control mounted directly above watches the riser opening through a viewing tube. When the molds are in place, the operator, through pushbutton control of a hydraulic mechanism, tips the ladles of molten iron and the white-hot metal flows into the molds. As it reaches the riser of each mold, the brilliant light thrown off signals the phototube that the mold is full. The electronic unit causes the ladle to drop back and the pouring operation automatically stops.

Hardening Sheep Gut.—One trouble surgeons have had with sheep's gut is that after the wound is sewed up the gut absorbs moisture and stretches. A roll of 1,000 feet of gut was submitted to electronic high-frequency heating at a temperature of 300 degrees Fahrenheit. This case-hardens the gut, making it relatively impervious to moisture, and gives it better slipping qualities. Conventional ovens used for the process require an eight-hour bake. The job was done by high-frequency equipment in six minutes.

Precipitation of Ore.—A new electronic ore separator has successfully refined ores of such metals as tin, iron and gold. Most promising results have been attained with low-grade ore samples from a recently developed tin deposit in a southern state. The operating principle is much like that of the Westinghouse Precipitron that has been used for many years to remove smoke, dust and liquid particles from air. By spraying elec-

trical charges on this ore, which contained only 1½ per cent tin, the metal was separated from rock and sand, concentrating it into an ore containing approximately 70 per cent tin—suitable for melting.

The ore is ground to the fineness of sand, dried, and then poured into a trough at the top of the separator. The particles of sand, rock and tin trickle onto a rotating metal drum, where they receive high-voltage electrical charges from a series of fine wires a short distance from the drum's surface. Since the tin particles are good conductors of electricity, the electrical charges seep through them and into the metal drum. The tin particles thus lose their charges before the drum has made more than one-half turn and fall off the drum. The nonconducting sand and rock particles retain their charges and cling to the drum until pulled off—during the second half revolution—by a series of oppositely charged wires. The electrostatic separator can sort mixtures of any two materials provided one component is a conductor of electricity and the other such a poor conductor that it is in effect an insulator.

Gaging Piston Rings.—Automatic inspection of the trueness of periphery and the width of gap of a specific size of piston ring is being done by electronic means. Inspection is much faster than present hand-checking methods and the production rate is determined by the speed at which the rings are presented to the gage. The inspection cycle per piece is less than five seconds. The piston ring to be checked is inserted inside a master ring which is placed on the instrument table and rotated by a power-driven roller. The gaging functions are performed by scanning beams of light directed onto phototubes which energize electronic circuits to illuminate three signal lights. As the ring revolves, one beam of light is projected on the periphery of the piston ring. A clearance between it and the master ring will result from any out-of-round condition of the piston ring and permit a portion of the lightbeam to fall on the phototube. A red rejection signal flashes should excessive light indicate that the piston ring is out-of-round beyond an acceptable point. A green signal flashes at the end of one complete revolution if the width of gap is within tolerance. Another beam of light actuates a yellow signal should the gap be undersize. A third beam of light energizes another circuit to illuminate the red rejection signal should the width of gap be oversize.

Rubber Curing.—An electronic rubber curing process that is as much as 17 times faster than the conventional steam methods is being used extensively at the Firestone plant in Akron, Ohio. Many of the company's rubber products are being cured or vulcanized by means of electronic heating. Because electronic heat is more uniform and more easily controlled, a better product is obtained, according to company officials. This process is expected to save thousands of man-hours and increase the output of materials 50 to 80 per cent. The product to be heated is placed between two metal plates that are supplied high-frequency A-C power by an electronic generator.

Crack Detector.—A photoelectric crack detector for use in the inspection of glass bottles and jars inspects units as they pass on a rotary turntable, automatically singling out and rejecting those that contain minute cracks or surface irregularities. Such flaws might prevent airtight sealing and result in spoilage of food packed in

such jars. Two out of every hundred containers with flaws escape detection by human inspectors. The electronic instrument inspects bottles and jars as they come from the bottle-making machines and exceeds human inspectors in both speed and accuracy. The containers automatically move in front of a sensitive photoelectric cell and are whirled rapidly while a light is directed on the part to be inspected. The photocell is not activated by a steady light, and light reflected by a perfect glass produces no effect. When a glass with even slight imperfections on the sealing edge passes, the light beam flickers and this quick change activates the cell and the defective jar or bottle is rejected.

Electronic Joy Stick.—A new electronic control stick is used on heavy four-engine bombers, including the B-29 Superfortress. With it, pilots fly large aircraft with the ease and accuracy of a small plane. Called the "Formation Stick," it consists of a pistol-grip lever about ten inches long mounted with an arm rest beside the pilot. It moves in all directions just like the "joy" stick of pursuit planes. Through electronic amplification and the servo motors of the control surfaces, the stick moves the airplane in the same direction and in the same proportion as the stick itself is moved. It was designed originally for the relief of pilots who had to fly long distances before hitting their targets.

Phototubes for Railroads.—The door of the Diesel locomotive shop of the Erie Railroad is opened by the beam from the headlight of an approaching locomotive while it is still some distance away. The lightbeam hits photoelectric tubes that actuate the door-opening mechanism. This permits the locomotive to enter the shop without a preliminary stop. A sun visor over each phototube prevents the sun from activating it.

The sand for the sand boxes of these 5,400-hp four-unit Diesel freight locomotives is dried by steam coils over a drum, into which the sand flows by gravity as it dries. A pipe in the side of this drum is so shaped that it permits sand to spill over when the drum is full. Through these windows in the pipe a beam of light passes to a phototube. When the drum is empty, the windows are again clear and the light beam reaches the phototube. This turns off the compressed air, reopens the inlet to the drum, and allows it to fill again, ready for the next operation. This mechanism has proven more dependable than any previous springs, switches, or other mechanical action.

Liquid Level Indicator.—An electronic gas gage developed for bombing planes may find application in a large number of manufacturing operations, in refineries, large storage vats, and even to measure the moisture content of grains and other materials. The gas tanks of the airplane contain capacitance units which connect to an electronic amplifier. Each capacitance unit consists of a piece of tubing which contains two smaller pipes inside to form the elements of an electrical capacitor. Gasoline flows freely inside the tubing and between the two inside pipes. The electrical capacitance of the gasoline changes with the height of the liquid within the tank unit and is measured electronically by the amplifier. This in turn actuates an indicating dial on the plane's instrument panel to show the contents of the tank in gallons.

Thickness Gage.—Designed for petroleum operations but having other applications, an electronic instrument makes it possible to gage the thickness of the walls of oil piping, refinery

towers, and other structures subject to progressive corrosion from the outside, without dismantling them or taking them out of operation. The accuracy is said to be within plus or minus 3 per cent. The instrument consists of a cylindrical gaging head a couple of inches in diameter and somewhat over a foot in length, and a control box which contains electronic equipment. The head houses 1 milligram of radium in the form of a commercially available salt, a specially developed radiation detector of the Geiger-Mueller type, a shield between the radium and the detector, and a preamplifier to magnify the electric impulses of the detector sufficiently to carry them through a cable to the control box located some distance away.

The head is attached by permanent magnets or other clamping means to the outside of a pipe, tank, or ship plate. Gamma radiation from the radium goes through the wall and from the atoms in the wall to the detector in proportion to the wall thickness. The amount of reflection is indicated on the dial of a microammeter on the face of the control box. Since the atoms of different materials—steel, aluminum, plastic—give different degrees of reflection, the actual thickness is obtained by checking the dial reading with charts supplied with the instrument. Determinations of liquid levels in completely closed containers and even the specific gravities of the liquids themselves can be also made.

Electronic Sorting.—Balls for bearings in aircraft instruments are sorted by a new automatic ball gage. Four of the instruments served by one operator are said to sort more balls more accurately than 32 skilled operators using conventional measuring equipment. Commercial balls, which have already been graded to a tolerance of 1/20,000 in., are fed into a hopper from which they fall into tumblers, having been divided into matching groups five times more accurate. As many as ten size selections are made by the electronic equipment. Each group is separated from succeeding groups by only 10-millionths of an inch.

X-ray Snapshots.—High-speed X-ray equipment has been developed that has sufficient power to take millionth-of-a-second X-ray snapshots. One use is for studying the motion and behavior of a bullet inside a gun barrel. No other means is available for taking a picture of a bullet as it passes down the bore of the gun. Previous methods of determining the location of the bullet at any instant in the gun barrel, such as by strain gauges, have proved to be inaccurate.

The high-speed X-ray equipment has been used to observe the realignment of component parts inside the bullet when it is fired. A stationary X-ray picture is taken of the bullet in question. The bullet is then fired and a high-speed X-ray picture is taken of this same bullet in flight. A comparison of the two then reveals any changes in the shape of the bullet.

High-speed radiography has also been used to study what happens to a bullet when it strikes a piece of armor, and also what happens to the armor during penetration. Ordinary photographic methods, including high-speed photography, are handicapped because the actual penetration is obscured by luminous fragments thrown back at the time of impact.

High-speed X-ray pictures have been taken of armor-piercing bullets during the actual penetration. Two pictures were taken in sequence of a .30-caliber armor-piercing bullet penetrating a small two-by-two-inch piece of ½-inch thick

armor. The first was taken when the core of the bullet had penetrated ⅜ inch into the yielding armor plate. The jacket, which cannot penetrate the armor, had telescoped forward on itself and exposed the core. The second high-speed X-ray picture was taken of this same bullet approximately 20 microseconds later. The core of the bullet had penetrated the armor and its tip was projecting through the back. Part of the armor pushed out by the penetration could be seen.

Induction Heating.—Many brazing and soldering operations have been improved by electronic induction heating. The main advantages are that the heat acts quickly, can be confined to a small area, and close control is possible. Joints are free of oxidation, heating costs are reduced and semi-skilled operators can be employed. In one plant, a brazing operation that originally took a highly-skilled operator four minutes with a gas torch could be done by unskilled women operators in 40 seconds using induction heating equipment. Inspection of the joints became unnecessary because of the uniformity provided by the electronic method.

Hollow propeller blades for airplanes require a fillet of copper or copper alloy in the leading and trailing edges. Welding on the outside edge is not sufficient to hold the two pieces together and is not possible along the inside edge. In electronic brazing, beads of brazing material are laid along the inner edge and the propeller is moved edgewise through a coil to fuse the beads and bind the edges together. The same job could be done with a torch but would take a longer time and require more highly skilled operators. Greater warpage of the blades would also result.

Oil-well drill bits are toughened by a layer of tungsten carbide deposited on the teeth under high heat. This was done with a gas torch by an operator who slowly and laboriously applied the carbide to each of the 20 teeth, one at a time. The whole bit can now be carbided in a few seconds by locating the tungsten carbide in position on the teeth, then placing the bit inside the coil of an electronic unit that heats the 20 teeth all at once. Unskilled operators do the work on semi-automatic equipment.

Soldering is a high-speed production process with electronic heating. One terminal connector used in fighter planes contains 30 wire connections that took 15 minutes when soldered one at a time with a hand iron. The entire job took only 15 seconds with electronic heating.

In assembling quartz crystal units for radio equipment, gas soldering often caused overheating and warping or cracking of crystals. With induction heating, this danger is entirely eliminated and six crystal units are soldered simultaneously by electronic means in three seconds. Heat is produced only where it is needed at the joint area, so fast that no harmful heat is conducted to the crystal.

Cost of electronic heating is high when compared with that of steam, arc, gas and other methods. Because of this, general use of electronic heat as a substitute for conventional methods in plants is highly improbable. Electronic heating is a specialized technique that is economical when it does a better job, a faster job or a job that can not even be done by conventional heating equipment.

Finds Break in Wire.—The guesswork usually involved in locating broken wires under the insulation of extension cords and those used on electrical appliances is eliminated when an elec-

tronic tester is used. In the unit, one electronic tube is connected as a self-excited oscillator operating on a frequency of about 400 cycles. The output of this oscillator is applied to the cord. A small amount of the signal energy is picked off the cord by a metal ring through which the cord is passed. Fed to a high-gain amplifier with more vacuum tubes, the signal amplitude is increased sufficiently to operate the output meter. When a break in the conductor passes through the ring, a sudden change in the meter deflection occurs and the broken spot can be quickly and accurately ascertained. Thus, the necessity of cutting the cord in more than one place to locate the break is eliminated.

Sorting Small Parts.—Much greater speed in the sorting and inspection of tiny contact assemblies has been made possible through the development of an electronic sorting table which routes the assemblies into three different channels depending on whether they are too high, too low, or within the required tolerances. Hand sorting was formerly used and each contact assembly was checked with a needle micrometer to determine whether it was oversize, undersize, or within the tolerances.

With the specially designed sorting table, each assembly is fed onto a 45-degree slide. About halfway down the slide, the assembly comes to a contact point located at preset height. If the assembly touches the point, it is oversize, and the contact made closes the grid circuit of a vacuum tube, which in turn energizes an electromagnetic relay. A solenoid is next energized, sending the assembly down a chute into a container for oversize parts. A short distance beyond the first point, a second contact point is set at standard height less tolerance. Since oversize assemblies have already been eliminated at the first contact point, parts touching the second point are within acceptable limits and go down another chute. Undersize assemblies do not touch either point and slide undisturbed to a third tray.

Case-Hardening Bearing Pins.—High-speed electronic heating on a production line has been established for case-hardening finished bearing pins to a depth of 0.025 inch. The pins are fed automatically through a glass tube and quenched with water as they leave the heating coil at a rate of 75 pins per minute. The r-f generator operates at a frequency of 5 megacycles and heats the surface of each pin above its critical temperature in less than one second. At this speed, the heat cannot penetrate into the core and only a thin surface layer undergoes change in physical state. The central portion of the pins retains original toughness and strength.

The factory application of this process involves the following equipment: the hopper from which the unhardened parts are fed into the glass tube, the heating coil, an electronic-induction heating unit, a connection providing a continuous flow of water for quenching, and a work table with suitable containers for hardened pins as they are ejected from the heating fixture. The metal was chromium molybdenum steel NE-9442 and the surface hardness developed was Rockwell C 60—about file-hardness. The pins were finish ground prior to heat treating, and, after the hardening process, there was no scale or warpage.

Oil Refining Indicator.—In modern oil refineries, accurate boiling points of the various vapors, to be separated in fractionation, must be predetermined in the laboratory. An electronic

instrument for this purpose consists of a continuous-balance pyrometer which is mechanically connected to a conventional recording potentiometer. A special high-sensitivity fine wire thermocouple, consisting of six individual couples spaced about one-half inch apart, is located in the reflux zone of the fractionating column. The electromotive forces produced by these thermocouples are amplified by electronic tubes and recorded continuously by pen on a time-temperature strip chart. The electronic recorder and a special Podbielniak fractionating column make possible rapid and accurate separation of compounds whose boiling points are only one and one half degrees apart, a feat which cannot be accomplished by the older type of apparatus. The new development considerably reduces distilling time, with increased accuracy, and opens up a new field in fractional distillations. See also ELECTRICAL AND ALLIED DEVELOPMENTS.

KEITH HENNEY,
Editor, Electronics.

ELKS, Benevolent and Protective Order of. A charitable, fraternal and patriotic order founded in New York in 1868. Membership is limited to white, male citizens of the United States, 21 years old or over. There are approximately 1,400 lodges in the order with a combined membership of 750,000. The order maintains at Bedford, Va., a home for aged and indigent members; and in Chicago, a memorial building dedicated to members who served in the First World War. An Elks National Foundation Fund, administered by 7 trustees, is wholly devoted to charitable and educational purposes—all operating costs being borne by the Grand Lodge. In 1945 emphasis was placed by the order on war work—recruiting, fraternal centers for service men, gifts for service men, and purchase of war bonds. The order has a rehabilitation fund for aiding returned veterans, aids crippled children and tubercular patients, grants scholarships, and generally assists the needy. It publishes *The Elks Magazine*. Only an emergency session was held in 1945 in compliance with government regulations.

Officers, July 30, 1945: Wade H. Kepner, Wheeling, W. Va., grand exalted ruler; J. E. Masters, grand secretary. Headquarters: Elks National Memorial Building, 2750 Lake View Avenue, Chicago 14, Ill.

J. E. MASTERS,
Grand Secretary, B. P. O. E.

ELLES, Sir Hugh Jamieson, British Army officer: b. April 27, 1880; d. London, England, July 11, 1945. Appointed commander of the British Tank Corps in September 1916, Gen. Sir Hugh Elles is best known for his work in the development and justification of the tank during the First World War.

Educated at Clifton College and the Royal Military Academy at Woolwich, Sir Hugh took part in the South African War from 1901 to 1902. In January 1916, Gen. Haig, commander in chief of the British forces in France, sent him back to England from the western front to report on the progress in the manufacture and capabilities of the tank as a new engine in warfare. On Sept. 15, 1916, Sir Hugh was at the Fourth Army front during the Battle of the Somme when tanks were used for the first time. Late the next year, he led the victorious attack of 350 tanks in the Battle of Cambrai. He received the Distinguished Service Order in 1916 and was knighted in 1919. In 1934 he was appointed master general of ordnance, fourth military member of the Army

Council, and colonel commandant of the Royal Tank Regiment. He became general in 1938 and retired the same year. From 1939 he served as regional commissioner of South West England.

ESTONIA. A Baltic Republic, bounded on the west by the Baltic Sea, on the east by Lake Peipus and Soviet Russia proper, and on the south by Latvia. It has an area of about 18,353 square miles, including the islands of Dagö (q.v.), Ösel (Saaremaa), and Moon in the Baltic Sea, and a population (1940 estimate) of 1,120,000.

From the early part of the 16th century until 1721 the country belonged to Sweden. In that year it became a part of the Russian Empire. In 1918, after the outbreak of the revolution, Estonia gained her independence and was recognized by Soviet Russia in 1920 and by the United States in 1922. A democratic regime was established which lasted until 1934 when, stimulated by the example of Hitler in Germany, Konstantin Päts staged a putsch, suspended the Diet, and established a dictatorship which remained in power until 1940, in spite of the fact that a democratic constitution was formulated (but not applied) in 1938. In 1939 the dictatorship collapsed under pressure brought to bear by Soviet Russia, and following a national referendum held throughout Estonia under Soviet auspices July 14 and 15, 1940, the country was incorporated into the USSR. Her status as the Estonian Soviet Socialist Republic, however, was not recognized by either Britain or the United States. When Germany declared war on Soviet Russia, Estonia was invaded by the Nazis in the summer of 1941, Tallinn, the capital (pop. 145,000) falling to Axis troops on August 29.

Religion and Education.—No state religion has existed in Estonia under any of its recent regimes. Approximately five sixths of the population are estimated to be Lutherans, the remainder adhering to the Greek Orthodox, Roman Catholic, and other faiths. Education, similarly, has been free and compulsory. There were 1,224 elementary schools in 1938; 58 middle schools; 39 technical and handicraft schools; 30 agricultural schools; 13 domestic economy schools; 14 commercial schools; and 2 teachers' training schools. There was one institution for higher learning, the Tartu University, with 3,219 students in 1938; and a Polytechnical Institute in Tallinn having 513 students.

Finance.—In 1941 the budget was fixed at 580,166,000 rubles. (Equal at par to \$.515 in U.S. money.)

Production.—Once a thriving industrial nation, Estonia, on severing its ties with Russia in 1920, decayed industrially and became largely an agricultural nation. Farming and dairying were the chief occupations of 70 per cent of the population in 1938. The total area of approximately 10,789,959 acres consisted at that time of 2,314,141 acres devoted to forests; 2,683,259 acres of fields; 2,186,054 acres of meadows; 1,774,697 acres of pastures; and 1,502,368 un-

tillable acres including a peat bog of 329,440 acres. Current, or even recent, statistics are unavailable on production; but the chief crops were potatoes, rye, oats, barley, and wheat. There were 277 dairy factories in 1938, butter being the chief article of export. The most important industries included textiles, paper, oil shale, cement, timber, flax, and leather. Industrialization of the country received marked impetus in 1940 under the new regime then instituted. Imports in 1939 amounted to 101,351,000 Estonian kroons (equal at par to \$.268 in U.S. money), and exports to 118,217,000 kroons.

Principal Events.—Freed from German occupation in the autumn of 1944, Estonia settled down in 1945 to rehabilitate its damaged homes, industries, and communications. The organs of Soviet rule were reconstituted, over 20,000 persons being selected as rural representatives, and to act on the executive committees and their permanent commissions. Land reform measures were reinstituted, former landless agricultural laborers and poor peasants again becoming landholders. Substantial assistance was given these farmers in the shape of implements, building materials, cows, horses, and loans of money and seed. Machine and tractor stations, and also machinery and horse-hiring stations, were restored, and these factors contributed to the successful completion of the country's sowing plan in the spring. Agricultural co-operative societies with a network of food processing plants, dairies, and slaughterhouses were revived. Over 40 per cent of Estonia's industrial plants had been saved from destruction at the hands of the retreating Germans by the swiftness of the Red Army's advance; and the industrial plan for 1945 provided for raising industrial production to 70 per cent of the 1941 level by the end of the year. A three-year plan for industry was adopted, which involved the employment of 40,000 underground workers in mining shale, to be transformed into liquid fuel and for the production of gas. Approximately 80 per cent of Estonia's shale-oil production had been restored early in the year, and a new shale-fuel plant started operation in June. Several superphosphate and carbon-dioxide plants were reopened, and also a number of electric power stations. The large cotton factory at Arsenholm was retooled. About 20,000 spindles went into operation at the restored Krenholm textile plant during the first quarter of the year; the manufacture of yarn was resumed in Tallinn; and a cloth factory began operation in Sindi. The Union Tannery and Shoe Combine in Tallinn, which produced 1,000 pairs of shoes monthly in 1941, rapidly restored its production volume, and in the same city the Krasnaya Zarya plant, which before the war manufactured an average of more than 1,000,000 pairs of women's stockings a year, steadily increased its production of textiles and hosiery. The Stakhanov system, introduced from Soviet Russia, was reported to have increased production markedly in many industries, and youth brigades were formed to work in factories, fields, and mines. Academic life was renewed, there being about 120,000 students, almost as many as before the war. Technical and vocational schools reopened; the ancient university in Tartu and the Polytechnical Institute in Tallinn functioned again. Publication of Estonian literature was resumed on a wide scale.

ETHIOPIA. A landlocked independent country of East Africa, having an area of about 350,000

square miles and a population estimated at 9,500,000. Subjugated by the Italians in 1936, it was reconquered in 1941 by British troops and Ethiopians irregulars. The capital is Addis Ababa (pop. 150,000), and other towns include Dire Dawa (50,000) and Harar (30,000). The ruler is Haile Selassie I (born July 17, 1891), who was crowned king (Oct. 7, 1928) and then emperor (Nov. 2, 1930); he was an exile in Great Britain during Italian occupation of his country. After the emperor's restoration, the British Treasury provided regular financial assistance to the Ethiopian government and paid for the training of a new Ethiopian army; and British officials were attached to the administrative departments, police forces, judiciary, and scholastic system. Revenue in 1943-44 was £2,345,192, and expenditures amounted to £3,128,214. A two-year agreement concluded in 1944 renewed permission for tribes of neighboring British Somaliland to graze their cattle for six months each year in "reserved areas" of Ethiopia. While the majority of the inhabitants are Christians of the Coptic faith, Moslems predominate in some of the provinces. The government and missionary bodies maintain elementary schools; a secondary school was established at Addis Ababa in 1944 to train teachers and civil administrators.

Agriculture and the raising of cattle, sheep, and goats are the chief industries. Cotton, sugar cane, dates, and millet are among the chief agricultural products, and barley and wheat are also grown. There is a considerable trade in hides and skins. Industries established since expulsion of the Italians include the tapping of wild rubber, cotton textile weaving, and the manufacture of rope and sacks. Iron, marble, mica, rock salt, platinum, and gold are among the minerals produced; other mineral deposits include coal, copper, sulphur, and potash salts. Imports in 1943-44 amounted to £3,910,090 and exports to £2,184,108. The Italian lira no longer circulates. Until a new Ethiopian currency becomes available, the Maria Theresa dollar and the coinage of British East Africa are legal tender.

A railroad runs from Djibouti, French Somaliland, to Addis Ababa, a distance of 487 miles. During the Italian tenure, numerous good highways were constructed in Ethiopia, the aggregate length being 4,340 miles; Addis Ababa and Gondar were linked by road with Asmara, Eritrea; and from Assab, a secondary port in Eritrea, a road ran to Dessie, and thence to Magdala. Internal telecommunications are mainly wireless. There are numerous airfields, some built by the Italians and others, during the war, by the British.

Principal Events.—In December 1944, Great Britain surrendered her exclusive rights in Ethiopia, the British minister no longer taking precedence at the emperor's court and Haile Selassie becoming free to choose foreign advisers from any country he might desire. Britain also withdrew her military forces from the country except in certain border areas and relinquished her exclusive air rights, all Allied air forces securing the right of transit and landing. The British also ceased to operate the railroad, which was taken over by the Ethiopians as far as their frontier with French Somaliland. The United States furnished aid to Ethiopia under the lend-lease provisions, and in 1944 despatched a technical mission to the country. During February 1945, Emperor Haile Selassie conferred in Cairo with Prime Minister Winston Churchill and Foreign Secretary Anthony Eden, and aboard an American warship

near the Suez Canal with President Roosevelt. John K. Caldwell, United States minister to Addis Ababa, formally restored to the emperor in July 1945 many of his valuables stolen by the Italians and subsequently recovered in northern Italy after the war by American forces; the 350 treasured articles, of a total weight of 800 pounds, included royal robes and a large quantity of silverware. Ethiopia sent a delegation to the United Nations Conference on International Organization, at San Francisco, and became one of the signatories of the charter of the United Nations. Direct radio-telegraphic service with the United States was established on May 17, 1945, when messages of friendship were exchanged between the heads of the two countries. Cordial relations with France were also re-established in September, when agreement was reached on the exact demarcation of the frontier between Ethiopia and French Somaliland; the Italians, during their occupation of Ethiopia, had built roads on what the French had claimed was their territory.

Of far greater portent, however, was the announcement on Sept. 7, 1945, that the Ethiopian government had given to the Sinclair Oil Corporation a 50-year concession for the development of the country's petroleum resources. The Standard-Vacuum Oil Company (owned jointly by the Standard Oil Company of New Jersey and the Socony-Vacuum Oil Company) had obtained a concession in 1935 but canceled it at the request of the State Department when Italian invasion of the country was imminent. The Ethiopian government is to receive from the Sinclair Oil Company royalty payments at a rate to be increased five years after production has commenced; the basis for payment may be revised after 15 years. The company, for its part, is to promote the general welfare of Ethiopia, establishing "a trade school or schools, a hospital or hospitals, clinics, sanitary facilities, research organizations, and other public institutions for the enhancement, education, health, culture, and prosperity of the people of the country." The agreement further stipulated that the company shall provide sums annually over a period of 10 years for the education and training of Ethiopian subjects in the United States. In the event that oil in commercial quantities can be located, Ethiopia will enjoy an unprecedented opportunity for advancement.

After the sufferings which his country had endured at the hands of the Italians, and on historical grounds, Haile Selassie deeply resented the fact that he was twice denied permission for representation of his country at the meeting of the Council of Foreign Ministers in London during September 1945, when a peace treaty with Italy came up for discussion. He had to be content with submission of a memorandum, in which he put forward claims to Italian Somaliland and Eritrea; he declared that these lands had been part of Ethiopia since before the Christian era, only to be stolen by Italy during the 19th century. However, both Egypt and Russia also sought to acquire Eritrea, and the United States thought that Italy should administer all her former colonies on behalf of the United Nations, while the course which would be favored by Great Britain, who had conquered the colonies, had still to be learned. Transfer to landlocked Ethiopia of Assab, a port in southern Eritrea, could certainly be justified on economic grounds since Djibouti, natural outlet from the country, remained in French hands; but it was doubtful whether Haile Selassie would obtain general assent for annexation of other areas to his own backward domains.

EUROPE. See articles on FRANCE, GERMANY, USSR, etc.

EVANS, Caradoc, Welsh novelist, playwright, and journalist: b. Pantycroy, Llandyssul, Wales, 1883?; d. Aberystwyth, Wales, Jan. 11, 1945. Caradoc Evans' literary career had been the center of continuous controversy: his bitter criticism of the Welsh, and Wales, outraged many of his fellow countrymen, and he was stoned and burned in effigy, while his books were denounced from public platforms and pulpits throughout Wales.

Apprenticed at the age of 13 to a draper at Carmarthen, Mr. Evans worked about 12 years in various London and provincial draper shops. As he was determined to become a journalist, he attended evening classes at the Working Man's College in London, but his progress in English was slow. He eventually decided to learn English from the Bible, and to write Welsh stories in biblical English. He established his reputation with *My People: Stories of the Peasantry of West Wales*, published in 1915. In later years, Mr. Evans did editorial work on *Everybody's Weekly*, *Harmsworth's History of the World*, and *The World's Great Books*, and was acting editor of *T. P.'s Weekly* and *Cassell's Weekly*.

Among Mr. Evans' other works are: novels, *Nothing to Pay* (1930), *Wasps* (1934), and *Morgan Bible* (1943); short stories, *Capel Sion* (1916), *My Neighbors: Stories of the London Welsh* (1919), and *Pilgrims in a Foreign Land* (1942); drama, *Taffy* (1924). He married Countess Barcynska, an Englishwoman who writes popular novels under the name of Oliver Sandys.

EXPORT-IMPORT BANK OF WASHINGTON. Created as a banking corporation under the laws of the District of Columbia on Feb. 12, 1934 pursuant to Executive Order No. 6581 dated Feb. 2, 1934, the bank was made a permanent independent agency of the United States by the

Export-Import Bank Act of 1945 (Public No. 173, 79th Congress, approved July 31, 1945). The purpose of the bank is "aiding in the financing and facilitating of exports and imports and the exchange of commodities between the United States or any of its territories or insular possessions and any foreign country or the agencies or nationals thereof."

The act of 1945 vests the management of the bank in a board of directors consisting of the Secretary of State and four full-time directors appointed by the president of the United States by and with the advice and consent of the Senate; and provision is made for an advisory board to make recommendations to the board of directors and advise on major questions of policy.

The affairs of the bank are administered by its president, Mr. Wayne C. Taylor, subject to its board of directors.

The act of 1945 also authorizes a capital stock of \$1,000,000,000 and increases the limit on outstanding loans and guaranties from \$700,000,000 to \$3,500,000,000. By the same act the Congress repealed the limitation on loans by the bank to governments which were in default on their obligations to the United States government.

The increase in authority and lending power has permitted the bank to make loans to liberated countries to finance purchases in the United States of equipment, materials and services.

The 1945 act expresses the policy of the Congress that loans should generally be for specific purposes and offer reasonable assurance of repayment.

Statistics of Operations.—From the time of its establishment to the end of 1945, the bank had authorized loans aggregating more than \$2,300,000,000, of which \$1,100,000,000 were authorized in 1945. Disbursements during 1945 were approximately \$80,000,000 and repayments were approximately \$51,000,000. As a result, outstanding loans increased from \$225,000,000 at the end of 1944 to \$252,000,000 at the end of 1945.

F

FAEROE or FAROE ISLANDS. A group of 21 islands in the North Atlantic, lying between lat. 61° 25' and 62° 25' N. about 280 miles south-east of Iceland, with an area of 540 square miles and a population (1935) of 25,744. They have belonged to the Danish monarchy since 1380, but were temporarily placed under British protection on April 12, 1940, after the German invasion of Denmark, to prevent their being taken over by the Germans. Strömö, Osterö, Sandö, Suderö, and Vaagö are the largest members of the group. Thorshavn, in Strömö is the seat of government. The inhabitants are of Norse ancestry and speak a Norse dialect; the official language is Danish. Autonomy is granted in local affairs, and representatives are normally sent to the Danish Parliament. Lutheranism is the predominant religion. Crops include turnips, potatoes, and barley. Sheep and horses are raised. The principal industry is fishing, others being sheep

farming and the manufacture of woolen goods. Chief exports are sea-fowl feathers, fish, whale oil, and sheepskins. See also DENMARK.

FALKLAND ISLANDS. A group in the South Atlantic Ocean, some 300 miles east of the Estrecho de Magallanes (Strait of Magellan), constituting a British colony. About 100 islets lie adjacent to two large islands—East Falkland (2,580 square miles) and West Falkland (2,038 square miles). The population was estimated in 1943 to amount to 2,444. The colony has five dependencies: South Georgia (1,450 square miles; permanent pop., 360); South Shetlands; South Orkneys; South Sandwich Islands; and Graham Land. Port Stanley (pop., 1,246), on East Falkland, is the capital and seaport. A governor (Sir Allan Wolsey Cardinall appointed Feb. 8, 1941) is assisted by an Executive Council of 7 members (2 of them nominated unofficials) and a Legislative

Council with a membership of 8 (4 officials and 4 nominated unofficials). Government revenue in 1943 amounted to £91,453, and expenditure was £98,307; there was no public debt. Education is free and compulsory. There are two schools at Port Stanley, one conducted by the government having 232 pupils in 1943, and the Roman Catholic community maintaining another with 20 children in attendance. The Falkland Islands Company supports full-time schools at Darwin and North Arm, and the government maintains a part-time school at San Carlos; elsewhere in outlying settlements, children are taught a few weeks annually at camp schools by traveling teachers. Sheep raising is the principal occupation of the people (mostly of Scottish descent) about 2,875,520 acres being in pasturage. Sheep numbered more than 625,000. Besides wool, sheepskins, and hides, products of the whaling industry are also exported. Total exports in 1942 were valued at £8,260, and imports, chiefly foodstuffs, textiles, fuels, and machinery, amounted to £9,870. All exports go to Great Britain, which is also the principal importer. The islands of the colony and its dependencies are served by vessels of the Falkland Islands Company, which also carry mails and passengers to Montevideo. Port Stanley is linked by telephone with other settlements on East Falkland; and the capital is also in wireless communication with Montevideo and with Gryt-viken, main settlement on South Georgia. A meteorological station is operated by the Argentine government on Laurie Island, South Orkneys, to report weather conditions in the Weddell Sea; cold winter in that area, it has been discovered, presages drought in the agricultural districts of Argentina three and one-half years later.

South Georgia is inhabited the year round by employees of companies engaged in the whaling industry, and they operate stations each season in the South Shetlands and the South Orkneys. Seal fishing and the garnering of guano are industries of lesser importance. In 1944 the British government dispatched an expedition to Hope Bay, Graham Land, to resume research work in the Antarctic which had been interrupted by the war.

FARM CREDIT ADMINISTRATION. In the year ended June 30, 1945, the Farm Credit Administration loaned more than a billion dollars to farmers and their co-operative associations. It kept its service geared to wartime demands but at the same time urged farmers to get in a safe financial position in order to face any postwar adjustments. Progress was made in the financial position of the institutions operating under its supervision. Seven of the federal land banks returned \$67,587,609 of capital and surplus to the U. S. Treasury. The production credit corporations returned \$6,700,000 of government supplied capital to the Revolving Fund. Eight of the federal land banks paid dividends to the national farm loan associations, a part of which was passed on to member-borrowers by 843 of the associations. In the year, the system served a large number of veterans and servicemen. Land bank and Commissioner loans amounting to \$1,347,650 were made to veterans and servicemen buying farms. Production credit associations, since Pearl Harbor, have extended credit to veterans and servicemen totaling more than \$11,500,000.

Production Credit.—The nation-wide system of 514 production credit associations made 214,883 loans for \$500,305,170 to finance crop and

livestock production, practically duplicating the previous year's business. More than 360,000 farmers and ranchers were members of the associations on June 30, 1945. They owned Class B voting stock with par value of \$27,415,085, and Class A nonvoting stock with a par value of \$3,817,139. Stock owned by members was 35.9 per cent of the total which compared with 30.6 per cent a year previous. Capital stock not owned by members is owned by the production credit corporations.

Many farmers who had borrowed in the past did not use the associations' facilities in the year because of their improved cash position. However, approximately 35,500 farmers and stockmen who had never before used the associations became members in addition to about 4,500 who had formerly been active members.

The eleven emergency crop and feed loan offices continued to make loans for crop production and feed for livestock to farmers unable to obtain credit from other sources at reasonable rates. Due to improved farm income, the demand for this type of credit declined 10.9 per cent from the previous year. Farmers obtained 81,653 loans totaling \$16,748,114.

The Regional Agricultural Credit Corporation of Washington, D.C., made loans totaling \$12,608,651, of which \$3,386,174 was restricted area loans used to increase the production of certain essential farm commodities vital to the war effort.

The 12 federal intermediate credit banks, a vital part of the production credit system, furnish the principal source of loan funds for the production credit associations and for many privately capitalized agricultural financing institutions, discount commodity loans made by the banks for co-operatives, and make some loans directly to farmers' co-operative business associations. Funds for loans and discounts are obtained from the sale of collateral trust debentures to the investment market.

In the year, the credit banks loans to and discounts for production credit associations amounted to \$657,991,903 or 75.3 per cent of the total. Loans and discounts for co-operative associations totaled \$2,737,092 or 0.3 per cent; for agricultural financing institutions, other than production credit associations, \$79,758,820 or 9.1 per cent; and \$133,156,053 or 15.3 per cent for the 13 banks for co-operatives.

Credit for Co-operatives.—The thirteen banks for co-operatives, one in each of the FCA district offices and the Central Bank for Co-operatives, loaned \$407,470,000 in the year ended June 30, 1945, compared with \$471,250,498 the previous year. The total for the 1945 fiscal year included \$27,585,000 in Commodity Credit Corporation loan documents purchased from co-operative associations. The decrease in loan volume was due largely to favorable agricultural conditions with many co-operatives increasing their capital and becoming debt free, and also to the lack of demand for loans for financing construction or the purchase of equipment because of wartime shortages.

On June 30, 1945, there was \$151,839,000, including Commodity Credit Corporation loan documents purchased, outstanding in loans to co-operatives. Of this amount 8.3 per cent was to grain co-operatives, 13.4 per cent to co-operatives handling farm supplies, 6.5 per cent to fruit and vegetable associations, 39.4 per cent to cotton co-operatives, 16.7 per cent to wool co-operatives, 2.9 per cent to associations providing farm business services, and 8.3 per cent to dairy co-opera-

tives. The remainder went to associations handling a variety of products.

Farm Mortgage Credit.—Long-time land bank and Commissioner loans totaling \$120,000,000 were closed by the 12 federal land banks operating through a nation-wide system of about 1,000 local national farm loan association offices. This money went to 27,016 farmers, compared with 21,202 farmer-borrowers the previous year, an increase of 27.4 per cent.

Favorable farm income again was reflected in the operations of the federal land banks and the Federal Farm Mortgage Corporation which handles Commissioner loans.

Farmers continued to make large repayments on their loans, many repaying their loans in full. Payments on the principal of federal land bank and Commissioner loans and loans paid in full totaled \$346,000,000 or an average of \$2.87 for each \$1 loaned in the year.

The proportion of land bank and Commissioner loans fully current on payments of interest and principal continued to improve. On June 30, 1945, 94.7 per cent of land bank loans were current on payments compared with 93.5 per cent a year ago. Commissioner loans showed 93.0 per cent current in 1945 compared with 91.6 the previous year.

Notable progress was made in the reduction of farm real estate held by the land banks and Federal Farm Mortgage Corporation. The 12 federal land banks held 765 farms and sheriffs' certificates on June 30, 1945, compared with 2,345 a year previous. The Federal Farm Mortgage Corporation held 645 farms on June 30, 1945, compared with 1,816 a year ago.

Farmers also have put money in the future payment funds of the federal land banks and Federal Farm Mortgage Corporation which they can later use to meet installments of land bank and Commissioner loans as they come due in periods of less favorable farm income. On June 30, 1945, these funds amounted to \$25,481,898. Interest on money in these funds is paid at the same rate a borrower pays on his loan.

Farm Land Situation.—Farm land prices continued to rise during the year reaching an average about 57 per cent higher than the 1935-39 levels. In some individual states and areas within states much larger increases occurred.

The Farm Credit Administration in the year continued to study the farm real estate situation and to use normal value as a basis in making loans. It co-operated with the Extension Service of the U.S. Department of Agriculture and other government agencies in sponsoring numerous land value clinics or appraisal demonstrations in various states. The demonstrations were given by federal land bank appraisers and were held on farms where the land bank method of determining normal agricultural value was explained to groups of farm leaders.

E. B. REID,
Director, Information and Extension, Farm Credit Administration.

FARM INCOME. See AGRICULTURE, REVIEW OF.

FARM LABOR. The Bureau of Agricultural Economics, United States Department of Labor, announced that, with only 10,017,000 persons employed on farms on May 1, 1945, a new low for that date, the available labor supply for farm work was continuing to decline. Farm operators, the bureau asserted, would continue to rely heavily on family labor, as they had done in the past three years. May 1 saw a 74,000 increase over the same date in 1944 in the number of

family workers, and a 125,000 decrease in the number of hired workers. The increase in family workers might mean, it was stated, that members of farm families who left to work in war plants were returning to the farms, and that there was a possibility that some laid-off war workers would be available for farm work later on, depending upon how rapidly reconversion got under way. Continued demand on the small supply of farm labor was expected to push farm wage rates above the record high of April 1, 1945, since wage rates for regular workers are usually set at the beginning of the season, and are not likely to be changed.

FARM MORTGAGE DEBT. The Bureau of Agricultural Economics, United States Department of Agriculture, announced in June that the farm-mortgage debt of the United States on Jan. 1, 1945, was estimated at \$5,250,000,000, a decline of one fifth from the 1940 level. Along with this decline occurred a major shift in the distribution of the debt among the several lenders. On Jan. 1, 1945, the federally sponsored agencies—federal land banks, Federal Farm Mortgage Corporation, Farm Security Administration, and joint stock land banks—held about 33 per cent of the total debt as compared with 43 per cent five years earlier. Private lenders, on the other hand, held a correspondingly larger proportion of the debt at the beginning of 1945. Of the decline in the total debt of more than \$1,333,000,000 between 1940 and 1945, more than 92 per cent occurred in the preceding three years. This decline of 20 per cent in the five years 1940-44 contrasts with an increase of 69 per cent during and immediately after the First World War—1915-19. In the five years, 1940-44, loans held by the federally sponsored agencies were reduced by \$1,112,000,000, or 39 per cent, as compared with a decline of \$1,316,000,000, or 20 per cent, for the total farm-mortgage debt. Loans held by all such agencies fell off during this period except those held by the Farm Security Administration, which increased from \$38,566,000 to \$178,936,000.

Loans held by the federal land banks alone decreased nearly 40 per cent, and loans held by the Federal Farm Mortgage Corporation declined more than 51 per cent. Since the enactment of the Emergency Farm Mortgage Act of 1933 the joint-stock land banks, not already in receivership, have been in liquidation. As a result, loans held by such banks have fallen from \$91,726,000 on Jan. 1, 1940, to \$5,455,000 on Jan. 1, 1945. On the latter date the remaining lenders held an estimated \$3,529,305,000, or 67 per cent of the total farm-mortgage debt. Life insurance company loans totaled \$933,723,000; insured commercial banks held \$449,582,000, and "other" lenders, \$2,146,000,000.

FARM POPULATION. Asserting that the farm population of the United States has dropped to the lowest point in 35 years, the Department of Agriculture, on July 4, estimated the number of persons living on farms on Jan. 1, 1945, at 25,190,000, a decline of 5,079,000, of nearly 17 per cent, since 1940. The department estimated that the farms lost 5,136,000 persons through migration or abandonment of farming operations, and 1,805,000 to the military services. These losses were offset in part by a net addition of 1,907,000 persons through excess of births over deaths. But despite the loss in farm population, the department stated that farm and food production has increased 35 per cent.

FARM SECURITY ADMINISTRATION (FSA). This agency makes loans and provides farm and home guidance to help low-income farmers earn better incomes and improve their living conditions. FSA was created Sept. 1, 1937, as an agency within the U.S. Department of Agriculture to replace the Resettlement Administration.

Started as a subsistence program in depression times, FSA gradually evolved into a plan for orderly rehabilitation of worthy but impoverished farm families with an ultimate goal of family-farm ownership. When the Second World War suddenly expanded the farmer's markets and provided employment for much of the surplus manpower among low-income farm people, Farm Security's supervised credit provided a basis for increasing food production on the family-type farm. Many small farmers were enabled to produce at nearer the full capacity of their resources of land and manpower.

Now in the reconversion period FSA is continuing its assistance to disadvantaged farmers, but an increasing portion of its work is with former servicemen and war workers who left agriculture and are returning to farm life. Many of them grew up on small, inefficiently operated farms and have limited experience in modern agricultural methods. Many do not have enough savings to cover farm and home operating expenses while the new start is made, and they lack sources of suitable credit.

Farm Security loans are made to farm families who cannot borrow on reasonable terms anywhere else. Two general types of credit are offered: (1) operating loans for livestock, equipment, feed, seed, and other farm essentials and family living needs; (2) 40-year loans to enable tenants, sharecroppers and farm laborers to buy farms under terms of the Bankhead-Jones Farm Tenant Act. Qualified veterans of the recent war are eligible for the farm-purchase loans the same as farm tenants, under terms of the Servicemen's Readjustment Act of 1944 (GI Bill of Rights). Water facilities loans for farmstead or irrigation water are made in the 17 Western States.

Credit is supplemented with individual guidance from local supervisors who help borrowers to prepare annual farm and home plans and to use improved farming and homemaking practices. Thus the families develop farming enterprises suited to their land and abilities, and learn good methods of caring for livestock and poultry, producing diversified cash crops, growing gardens and canning food for good nutrition.

Other FSA services include group medical, dental and hospital care plans, group purchasing of farm equipment and livestock, and assistance in improving tenure arrangements and in adjusting burdensome debts.

Loans to Veterans.—In the fiscal year ended June 30, 1945, rural rehabilitation loans (operating loans) were made to 2,550 veterans, and they received individual guidance in starting on land they rented or already owned. Sixty-six veterans obtained farm ownership loans; in each case careful attention was given to making sure the farm was one on which the veteran could earn an adequate living while paying his debt. In February 1945 the county FSA committees, which pass on all loan applications, were asked to act as special certifying committees in connection with the farm loan guarantees for veterans provided in the GI Bill. As of June 30 the committeemen had certified 406 veterans as eligible for guarantees of loans made by regular lending agencies for the purchase of farms or farm equipment.

Rural Rehabilitation.—Field workers in the 2,000 county offices concentrated their efforts on helping rehabilitation borrowers make fundamental adjustments and improvements in their farming so as to put their financial affairs on a sound basis for the postwar years. More attention than ever before was directed toward solving broad agricultural problems which low-income farmers often cannot overcome by individual effort alone. Appraisals of borrowers' farm and family resources were begun, providing facts from which to chart the course for general improvement of the program in the counties.

The average rehabilitation borrower cultivated more acres in the 1944 crop year than in 1943 and ended the season with more working capital, greater net worth, and a smaller debt to FSA. Borrowers' cash income from crops and livestock averaged \$1,395; including the value of the food and fuel they produced for home use, the gross farm income was \$1,836. Farm operating expenses averaged \$810, leaving net farm income of \$1,026. The families' net worth averaged \$2,522 at the end of the season; the comparable figure for 1943 was \$2,300.

More families applied for loans than could be aided with the \$67,500,000 available in the 1945 fiscal year. Farm Security made 24,996 new loans, and 102,890 supplemental loans to families already on the program who needed further help to expand their farming. About 300,000 families were active in the program during the fiscal year. More than 78,000 made final payments on their loans.

Ownership of Family Farms.—Because of rising land prices, extreme care has been taken in the farm ownership program to avoid the dangers of inflation. Loans are made only to applicants who can find good land for sale at prices in line with earning capacity values as computed on the basis of long-time average prices for farm products. The 1,870 loans approved in 1945 averaged \$5,942 compared with an average of \$5,994 in 1944 and \$5,721 for the period 1938–43. Some states used all funds allocated to them and could have made additional loans, while in other states some funds allocated were not used because sound buys could not be found within price limits.

Fifty million dollars is available in the 1946 fiscal year—half of it earmarked for veterans' loans. The \$25,000,000 for veterans may be used without regard to the requirement of the Bankhead-Jones Farm Tenant Act that loan funds be allocated among the states in accordance with farm population and prevalence of tenancy.

Since 1937 nearly 38,000 families have bought farms through this program. Their repayment record has been good each year, but the 1945 record was the best. Eleven hundred families paid their loans in full from farm income—years before final payments were due. The active borrowers as a whole, had paid 57 per cent more on their loans, as of March 31, than the amounts required to keep them current on the 40-year payment plan.

Water Facilities.—This activity rounds out Farm Security's services in the West where adequate water supply is vitally important to the farmer. More than 1,000 individual loans, and seven loans to groups, were made in 1945, and engineering aid was given in installing or repairing many types of facilities for farmstead and irrigation water. More than 11,000 families have been assisted through this program since 1938.

FRANK HANCOCK,
Administrator, Farm Security Administration.

FASCISM. The two great concentrations of Fascist power received their knockout blow during 1945 with the defeat of Germany and Japan. Fascist Italy had already given up in 1943. Only Spain, Portugal, and Argentina were left as open advocates of the Fascist program; and as the Axis powers were nearing their collapse, Argentina was impelled to declare war on them (March 27, 1945) and to send its representatives to the San Francisco Conference, while Spain and Portugal were brought under increasing Allied surveillance. The events of 1945 revealed fascism in its developed form as a system of predatory, militaristic, monopolistic dictatorships, linked (through the Axis and its supporters in various countries) on a world scale. Hitler and his National Socialists, with their blood and race obsessions, the German General Staff, with its long-range plans for military conquest, and the monopolists of German heavy industry and the Junker landlords, with their carefully-drafted schemes of expansion, had become as one in advancing the Nazi program and in exploiting the Nazi empire. As German fascism neared its eclipse, accounts multiplied of arrangements made through neutral countries by the chief beneficiaries of nazism for saving their holdings through transfer. With the collapse, the industrialists claimed dissociation from the Hitler regime, but were shown to have been deeply involved in plans for reviving German monopolistic enterprise and for bringing on a third world war. And while the falsity of the German claim to racial superiority had been demonstrated on the battlefields, the propaganda which the Nazis had used from the beginning of their rise to power—aimed to divide the forces opposed to nazism, and especially to create mutual fear and distrust between the Western Allies and the Soviet Union—continued to circulate in Germany long after the capitulation, and to be echoed in certain sections of the Allied press.

Official investigations and the testimony of trial witnesses brought full confirmation of the Nazi practice of genocide—the scientific mass murder of the “racially inferior,” and of disabled, infirm, or unwanted men, women, and children; or their systematic sterilization, or weakening through starvation, overwork, physical abuse, or unchecked disease. By thus reducing the strength of opposing groups (including their own dissentients), the Germans planned to achieve physical superiority over their opponents in the next war. In addition to their uniquely barbaric genocide policy, the most impressive testimony to the aims of the Nazis was their reduction of entire populations in the occupied countries to destitution and misery through systematic robbery or destruction of their material resources. In all commodities except those needed for war, fascism spelt scarcity and want.

In Japan a fusion between fanatical upholders of the imperial authority, the militarists, and the great monopolists (the *Zaibatsu*), similar to the German Fascist combination, was found to have produced similar effects. Evidence showed that the war had given the great corporations (with the aid of government bureaucrats, and with the imperial family as important investors) almost unlimited control of the Japanese economy, resulting in the absorption of many small enterprises; in private pilfering of civilian rice and clothing rations; in currency inflation; and in the general scarcity

and destitution characteristic of fascism. Japan itself was only a small part of the picture of Fascist havoc in the East, which had spread terror, destruction, and wholesale robbery throughout the “Southeast Asia Co-Prosperity Sphere.” At the time of Japan’s collapse, the Japanese monopolists, like those of Germany, ascribing the blame for the war and the defeat to political and military fanatics, prepared to evade responsibility for their substantial part in the Fascist enterprise, and to reap new harvests. But in Japan as in Germany, official Allied plans for dealing with the continuing threat of fascism tended to take account of its monopolistic as well as its militaristic and more strictly political character. United States government officials and other observers, through their experiences with fascism in 1945, arrived at a more developed definition of its meaning. They came now to define it (in essence) as the concerted use of misleading propaganda, armed force, and scientific mass extermination of enemies and “inferior” peoples, the better to convert all human and material resources on a national and international scale into a monopoly of the few at the expense of the great majority. Official action aimed at ending the threat of fascism moved toward complete acceptance of this definition.

FASHION DESIGNING. The end of the war found American fashion designers in a very fortunate position of prestige and opportunity, but bewildered by the suddenness of events that might result in reappraisal of fashion centers. The situation in the three countries most important for fashion influence did not help to clarify the future. Paris couturiers held openings in September, the first since the end of the war in Europe. However, their difficulties were many. There was no supply of fabrics. There was no coal to run the fabric mills. Transportation, high prices, and exchange rate made it prohibitive for clients from other countries to buy in Paris. French women were on a severe clothes rationing system, with a result that, although they might pay any amount of money they might have for their clothes, their number of purchases was severely limited. On the other hand, French trade missions visited the United States, and laid elaborate plans to attract the purchasers of French fashion products when they could be freely exported again. In the meantime, G.I.’s were purchasing perfume and other luxury accessories, bringing prosperity to the dressmaking houses which also feature cosmetics.

In London, neither dressmakers nor clients had much to do with. Coupons severely limited purchases. Manpower and material shortages curtailed production of better garments. However, under the Austerity Clothes Program sponsored by the government, English women of low income were assured of good, sturdy, inexpensive clothes. In most cases, they were designed by the best custom dressmakers for mass production. Consequently, the majority of English women had never been so well dressed. The success of this plan is likely to result in a clothing industry somewhat like that of the United States, as soon as conditions become more normal.

In the United States, opinion on many important questions was divided. There were those who felt all the government orders controlling design and manufacture of clothes should be immediately removed, to give the designer free reign. Others feared the effect of possible fashion changes on existing stocks of clothes, and those

for the winter season on order and in the process of manufacture. After numerous hearings of both sides in Washington, the removal of major restrictions was postponed, with a general impression that it would come in the late spring of 1946.

With more freedom than they had had for many years, American designers and manufacturers were confronted with a dilemma. Normal changes in fashion had been suppressed during the war years. Who would advance new ideas that the American public would accept? What authority would give prestige and fashion assurance to a woman buying a new dress of different silhouette? Before the war, French designers initiated; Americans initiated or adapted. Now, although American designers are far more self-sufficient, neither group is positive what will please the American customer. She has had to take her fashions short, straight, and narrow with no chance to look at anything else and decide whether she likes it. The French, used to putting more material into a garment, did not know how quickly American women would accept more fullness.

With transatlantic travel once more possible, although expensive and uncomfortable, a few American manufacturers and stylists went to Paris. While these visits were announced as exploratory, and only for good will purposes, undoubtedly those who braved the hardships and costs secretly expected some direct return. However, even though American manufacturers had been used to paying well for the models which gave them their fashion inspiration, they were not prepared to pay current Paris costs. One manufacturer proudly announced, however, that he had bought original models costing \$700 each in Paris—without expenses of shipment or duty.

When authorities agreed that Americans could hardly expect to buy models in Paris before the spring of 1946, and then only if present difficulties were surmounted, American designers resigned themselves to another season on their own. Many were jealous of the specter of Paris, fearing to lose their laurels. Others admitted freely that they could take Paris or leave it, but would prefer to take it, when its best again becomes available. But the more analytical among the manufacturers and designers foresaw improvements in both selection and timing, in order to make Paris more profitable for them.

Out of necessity was born an idea which gave fashion prestige to the American woman and her way of life and dressing. "The American Look," started as an advertising theme by a Fifth Avenue store, was so admirably descriptive that it became accepted overnight as America's own exclusive contribution to fashion.

The American Look did much to abolish from our thinking the inferiority complex that American women have always felt when fashion is discussed. With the coming of this expression and all the meaning it conveyed, American women came to realize that, in addition to being the most fortunate women in the world today, they have achieved a charm, a distinction, a quality of dressing and grooming as American as democracy itself.

What effect will the crystallization of all our style development into this single phrase have upon the rest of the world? A well-informed writer in a popular magazine in September 1945, went so far as to predict that Paris, London, Moscow, Buenos Aires, Melbourne and all other world capitals will imitate the American Look

far more eagerly than the world ever tried to ape the modes of Paris.

Increasing prestige and publicity were accorded fashion developments from noncommercial sources. The Metropolitan Museum of Art opened its impressive doors to an exhibit of costumes by foremost designers, created from fabrics inspired by museum collections. The Museum of Modern Art held its first exhibit with fashion as a theme, called "Are Clothes Modern?" Coty again presented awards, with an impressive fashion show and much fanfare, to three American designers: this time California's Adrian, acknowledged by many to be America's foremost designer; sportswear creator Tina Leser; and Emily Wilkens, who concentrates on teen age clothes.

That fashion as a business commands increased respect is proved by the terminology. In the vernacular, it was for some years called "the rag business." More recently, the more dignified term of "needle trades" came into use. It is only since the war gave this country the fashion crown, and Mayor LaGuardia made New York self-conscious about its opportunities, that the term "fashion industry" came into widespread use.

The fashion industry has prospered, in spite of shortages of practically everything, and almost insupportable delays. It is not at all uncommon for a store to place orders in June with manufacturers for dresses to be delivered any time up to November 30. A sellers' market kept buyers begging, cajoling and pleading with manufacturers for delivery of merchandise to sell. The buyer, instead of being feted by the heads of important manufacturing establishments, was not above offering favors and inducements to the delivery clerk, who determined which customers received merchandise.

Whatever stores could manage to get into stock sold at any price. While the government worried, had conferences and passed laws about the disappearance of utility clothing to suit the lower income brackets, there was almost no demand for this type of clothing. On the other hand, there was no limit on luxury clothes, nor on their prices. A pair of shoes sold commonly for amounts which would have purchased a very good dress in the thirties; handbags commanded prices for which a suit might have been custom tailored before the war; and a large middle western store purchased a single hat of rare feathers which it expected to sell for \$700!

As the year 1945 neared its end, one by one the luxuries precious to women began to return. Nylon stockings were put on sale by stores which had devised ingenious ways of preventing riots. Metals for jewelry and leather for handbags and shoes were released. Even two-way stretch elastic to control the American figure was expected.

And so, while 1945 presented no spectacular new developments, it proved to be a year of both self-inventory and of reconversion for the fashion industry.

JULIA COBURN,
Executive Director, Tobé-Coburn School for Fashion Careers.

FEDERAL BARGE LINES. See INLAND WATERWAYS CORPORATION.

FEDERAL BUREAU OF INVESTIGATION (FBI). This bureau was established within the Department of Justice in 1908 by Attorney General Charles J. Bonaparte. While originally called the

Bureau of Investigation, the present name was adopted in July 1935. The director of the FBI, Mr. John Edgar Hoover, was appointed in 1924 by Attorney General Harlan Fiske Stone, and has been reappointed by each succeeding Attorney General.

The FBI has its headquarters in Washington, D.C., and operates through 52 field offices located in the Continental United States and its territorial possessions. Its jurisdiction extends generally to all federal crimes not specifically assigned to another agency of the federal government. Specifically, it is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law.

At its Washington headquarters the FBI maintains, in addition to its administrative offices, its Identification Division, the FBI Laboratory, the National Academy and its Uniform Crime Reporting facilities. The Identification Division maintains the largest number of fingerprint records in the world. At the close of the 1945 fiscal year there were 97,497,563 sets of fingerprints on file. The FBI Laboratory was established in September 1932, as a scientific aid in crime detection. Here competent scientists are constantly working on evidence submitted by law enforcement agencies throughout the United States and in addition are conducting research to further aid law enforcement. In the fiscal year ended June 30, 1945, 136,098 examinations were conducted by the laboratory.

The FBI National Academy, established in July 1935, is concerned primarily with the training of police instructors and administrators. Applicants for attendance are carefully selected from local, county and state law enforcement agencies. The course of instruction consists of various phases of law enforcement with special emphasis placed on methods of teaching and organization of police schools.

In its Uniform Crime Reporting project the FBI, at the request of the International Association of Chiefs of Police and pursuant to an act of Congress, acts as a central clearinghouse for police statistics on a nationwide basis. Monthly and annual crime reports forwarded to the FBI reflecting information as to the number of offenses committed, the number cleared by arrest, the number of persons arrested, the number found guilty and related crime data, are summarized and published in the *Uniform Crime Reports Bulletin*.

The President of the United States designated the FBI as the clearinghouse for all matters pertaining to national security. The investigation of espionage, sabotage, subversive activities and violations of the Selective Training and Service Act also come within the sphere of the bureau's jurisdiction. By Presidential proclamations of December 1941, and July 1942, the FBI was made responsible for the apprehension of alien enemies in the continental United States, Puerto Rico and the Virgin Islands. By June 30, 1945, 16,054 alien enemies had been apprehended by the Federal Bureau of Investigation and co-operating agencies.

Both during and since the war, the FBI has continued to give close attention to its responsibilities in the general criminal field. These obligations include the enforcement of such laws as the National Motor Vehicle Theft Act, White Slave Traffic Act, Theft from Interstate Shipment

Statute, Federal Kidnaping Act, Federal Bank Robbery Act, National Stolen Property Act and many others.

During the fiscal year of 1945 there were 13,813 convictions in cases investigated by the FBI with sentences totaling 31,962 years, 4 months and 6 days, 1 death sentence and 6 life sentences. Fines, savings and recoveries amounted to \$16,534,436.21. A total of 8,955 fugitives were located and 7,892 automobiles valued at \$6,402,439 were recovered in cases investigated. The percentage of convictions of persons brought to trial was 96.9.

JOHN EDGAR HOOVER,

Director, Federal Bureau of Investigation.

FEDERAL COMMUNICATIONS COMMISSION.

To provide for the future expansion of existing radio services and for the introduction of many new services, the Federal Communications Commission during the fiscal year ended June 30, 1945, issued frequency allocations in the radio spectrum from 25,000 kilocycles to 30,000,000 kilocycles. Proposed allocations were also issued for the portion of the spectrum from 10 kilocycles to 25,000 kilocycles. Wartime developments had created many new and expanded uses of radio and had also produced equipment capable of operating far above the previous upper limit of the spectrum—300,000 kilocycles.

These allocations were decided upon following various hearings, including one *en banc* session, by the commission extending from September 28 through November 2, during which it heard 4,559 pages of testimony by 231 witnesses including representatives of the radio industry, of other interested organizations and government agencies and by members of its own staff. The industry recommendations were presented principally by the Radio Technical Planning Board which had conducted detailed studies for more than a year. Despite the obvious handicap under which both the commission and the industry labored because of the war, it is believed that this was the most intensive and comprehensive preparation for a proceeding of this character in the history of radio regulation. During the hearings it developed that despite the raising of the spectrum ceiling by wartime inventions, the demand for radio channels far exceeded the supply.

New services provided for in the allocations included Railroad Radio Service, the Citizens Radio-communication Service for short range communication, Rural Telephone Service, Industrial and Medical Service, General Mobile Service for motor vehicles and other land, air and marine mobile units, Limited Private Telephone Service employing light portable equipment for important communications in connection with the protection of life and property in construction activities.

In the consideration of frequency modulation (FM) broadcasting, there was substantial difference of opinion as to which area in the spectrum would afford the greatest freedom from Sporadic E and F-2 Layer interference. After lengthy study of this special problem, the commission decided to move FM from its existing location of 42-50 to 88-106 Mc. These transmissions, the commission concluded, were serious enough below 88 Mc to cause interference between stations at distances of hundreds and even thousands of miles, rendering FM receivers useless to many listeners for substantial periods of time. Twenty channels (88-92 Mc) were allocated for non-commercial educational FM; 70 channels (92-106 Mc) for commercial FM. This would

permit the construction of upwards of 5,000 FM stations.

Dr. John W. Studebaker, U. S. Commissioner of Education, testified at the hearing that plans were under way in 28 states to construct a sufficient number of educational FM stations, and to space them in such fashion that every single school and every single home in the state would be able to receive educational broadcasts from at least one station. He estimated that there might be as many as 500 such stations on the air in five years.

To facilitate the immediate postwar growth of television, the commission allocated 13 channels six Mc wide below 300 Mc., for which region of the spectrum equipment had already been developed and was in use. However, the commission's report asserted that there was not sufficient spectrum space available below 300 Mc to make possible a truly nationwide and competitive television system. Such a system, the report stated, must find its lodging higher up in the spectrum where more space exists and where color pictures and superior monochrome pictures can be developed through the use of wider channels. To make this development possible, the commission allocated the space between 480 and 920 Mc for experimental television. The commission urged all persons interested in the future of television to undertake comprehensive and adequate experimentation in the upper portion of the spectrum.

Increased channels were provided for aviation, facsimile, amateurs, fixed public services, coastal, marine relay, ship, mobile press services, police, fire, forestry and conservation services, electric, gas, water and steam utilities, transit utilities and for relay systems.

On May 21, 1945, the commission issued its proposed allocation of frequencies to nongovernmental services below 25,000 kilocycles providing for the addition of the 540-550 Kc channel to the present standard broadcast band; 120 channels for direct international shortwave broadcasting; more frequencies for amateur use and in addition a specific band for the establishment of a disaster communication network for amateurs; and a more equitable distribution of frequencies for aviation and small surface craft use. Oral argument on the proposed report was held June 20, 1945. At the end of the fiscal year a final decision on allocations in this region of the spectrum was still pending.

On July 25, 1944, the commission asked Congressional direction as to the policy it should follow in passing on the sale of radio stations where the sales prices are far in excess of the going-concern and physical property values of the stations and appear to involve considerable compensation for the radio frequencies themselves. A general public hearing (later postponed to October 23) was ordered by the commission on Feb. 20, 1945, to determine what changes, if any, should be made in the present policies on allocation of so-called clear channels in the standard broadcast band. Commission studies disclosed that although clear channel stations were authorized with the particular aim of providing the rural population with a radio service, there are still large areas which receive no radio service at all during the daytime hours and no primary service at night.

Two significant experiments in radio relay transmission were authorized by the commission. Western Union was granted authority on March 21, 1945, to make experiments to deter-

mine the practicability of radio relay circuits for the transmission of its regular commercial traffic, with a view to the ultimate use of radio relay circuits to supplement or to supplant wire circuits, and for the transmission of its common carrier traffic upon a regular basis. An ultra-high and super-high frequency wide band beamed communication system was to be installed by means of a chain of radio stations extending from Camden, N.J., to New York, N.Y., with intermediate unattended radio repeater stations at Bordentown and New Brunswick, N.J.

The Raytheon Manufacturing Company was authorized to construct five experimental radio relay stations between Boston and New York to develop a broad-band micro-wave relay system for the transmission and relaying of high definition television pictures, high-fidelity FM programs, and telegraph, telephone and facsimile communications. An important phase of the experimental program provides for the development of a system of aeronautical safety communications, aircraft traffic control and an automatic reporting service on the positions of aircraft which would be provided simultaneously with transmission of FM- and television programs and other point-to-point communications.

Changes in Rules.—Section 1.5 (b) of the commission's Rules of Practice and Procedure regarding Inspection of Records was amended so as to include in the files of the commission, open to inspection, all communications protesting or endorsing applications and amendments thereto filed under Title II (Common Carrier) and Title III (Radio) of the act, including all documents and exhibits filed with and made a part thereof.

To apprise listeners of the source and kind of payment received by radio stations for sponsored programs, including political broadcasts, the commission adopted a rule requiring appropriate announcements.

As a safeguard against circumvention of its rules requiring identification of recorded broadcast programs, the commission adopted an amendment requiring that stations "shall not attempt affirmatively to create the impression that any program being broadcast by mechanical reproduction consists of live talent."

Rate Reductions.—Following negotiations between the commission and the Bell System, rates for telephone calls between interstate points within the United States in excess of 790 miles, and between points in the United States and points in Canada in excess of 810 miles, were reduced on July 1, 1945, resulting in anticipated annual savings of \$21,000,000.

In line with its objectives of obtaining lower and uniform rates for international communications throughout the world, the commission authorized a number of important rate reductions during the year. Beginning in August 1944, the rates for three minute telephone calls between points in the United States and points in all but four countries in South America were reduced by amounts ranging from \$2.25 to \$6.75, or over 36 per cent in some cases. Subsequently, reductions were made between the United States, and most points in Central America and the West Indies, Hawaii, and Great Britain. Depending on the point of origin (or destination) in the United States, rate reductions have in some instances been over 50 per cent. At the close of the year negotiations were under way between the United States and international carriers and, in some cases, plans definitely made, for rate

reductions to and from other countries in Europe, South America and the Pacific area.

Reductions to 20 cents per word on full rate telegraph messages from the United States to Europe, Central America, West Indies, South America and the Philippines by the United States international carriers became effective May 1. The corresponding rates formerly effective ranged from 23 to 48 cents per word. Effective at the same time a uniform full rate of four cents a word was established by the Western Union Telegraph Company for transmitting international telegrams overland to and from any point in the United States beyond the gateway city where the message actually enters or leaves the country. Previously, the Western Union had rate differentials ranging from 4 to 15 cents a word for overland haul of international telegrams sent from or destined to cities located in different parts of the United States.

Extension of Service.—Because of wartime restrictions, the commission in general limited its authorizations for new standard broadcast facilities to small 250-watt stations where the necessary equipment and manpower were shown to be available. At the end of the fiscal year, 931 stations were in operation and 171 applications were on file. Net revenues from the sale of time totaling \$246,339,532 were reported by the four major and five regional networks and 875 standard stations for the year 1944 as compared with \$195,704,153 reported by these networks and by 841 stations for the previous year—an increase of 25.8 per cent.

The freeze on manpower and material continued to prevent the construction of new FM and television stations. Forty-six FM stations were on the air, 429 applications for new stations pending. Six television stations were in operation, with 118 applications on file. A total of 36 international stations were in operation.

Approximately 1,700,000 miles of toll message channels were added to the Bell Telephone System facilities. The commission authorized the construction of 1,112 route miles of coaxial cable suitable for both telephone and television transmission. The demand for telephone toll service continued to grow to new peak levels. During the year, 730,000,000 toll board calls were handled by the Bell System and 621,000,000 short haul toll calls were handled through Bell operated boards other than toll boards. These figures represent increases over the preceding year of 11 per cent and 3 per cent, respectively.

The commission authorized the construction of 269,965 channel miles of telegraph carrier systems at an estimated cost of \$1,162,651. At the end of the year, Western Union had, with the exception of three functional offices, completed the consolidation of telegraph offices as authorized in the commission's order approving merger with Postal Telegraph.

Following in the wake of the invading American armies, United States communications carriers instituted service from Italy on Feb. 1, 1944 and from France on August 31, 1944.

Experimental activities in the field of radio and electronics were developed to an unprecedented degree with the commission issuing 1,143 authorizations, a 100 per cent increase over the preceding year.

Safety and Wartime Activities.—To promote the safety of life and property at sea, an especially vital function during wartime, the commission field staff made 15,731 inspections of radio installations on cargo and passenger ships.

During the course of its work of maintaining a surveillance of the ether to detect espionage or other illegal radio transmission, the Radio Intelligence Division primary and secondary stations took 85,031 bearings. This was exclusive of bearings taken on distressed aircraft and vessels. The RID received 996 requests for direction-finding aid to lost planes, handled 1,895 complaints and investigations, found 46 illegal stations.

The Foreign Broadcast Intelligence Service, monitoring foreign radio broadcasts, provided texts and summaries of broadcasts originating in 55 countries daily by teleprinter, to 14 departments and agencies of the federal government by mimeographed daily reports to 23 and by special service to some 22 agencies which did not subscribe for the regular service. The material was also made available to the representatives of 22 foreign governments. All broadcast messages relating to American and Allied servicemen held prisoner of war were communicated immediately by wire to the War Department which notified relatives. Special reports based on broadcast material were prepared as required for military and civil authorities. The service was based on an examination of several million words of broadcast text monitored daily.

Commission employees at the end of the fiscal year totaled 1,513 of whom 784 were in Washington and 729 in the field. See also **ELECTRONICS; RADIO; TELEVISION.**

Commission.—The members of the commission are: Paul A. Porter, chairman, Paul A. Walker, Ray C. Wakefield, Clifford J. Durr, E. K. Jett, Charles R. Denny and William H. Wills.

PAUL A. PORTER,
Chairman, Federal Communications Commission.

FEDERAL CROP INSURANCE CORPORATION.

This agency was created within the U. S. Department of Agriculture by an act of Congress in 1938. Wheat crops were insured beginning with the crop planted for harvest in 1939. Insurance was extended to cotton beginning with the crop planted for harvest in 1942. Both wheat and cotton crops were insured through the crop year 1943. There was no insurance written on 1944 crops because the 1944 and 1945 Agricultural Appropriation Acts provided funds only for liquidating the insurance on 1943 and earlier crops. However, legislation enacted in December 1944 repealed the legislative provisions of the 1944 and 1945 Agricultural Appropriation Acts and changed certain provisions of the basic Crop Insurance Act with the view of improving the program and of extending the benefits of crop insurance to a larger number of farmers.

The act, as amended, authorizes the insurance of crops planted for harvest in 1945 and makes insurance protection available not only to producers of wheat and cotton but to producers of flax also. In addition, it provides for trial insurance on other commodities for the purpose of determining the most practical plan, terms, and conditions of insurance on such commodities. Such trial insurance on each commodity is limited to a period of three years in not to exceed 20 representative counties. It is limited to corn and tobacco in 1945 and can be started on only three additional commodities each future year.

The amount of insurance written for 1945 is shown in the tabulation below. The figures in this tabulation represent an abnormal situation; insurance was written in a short period after reinstatement on spring planted crops only. Insur-

ance is already written for 1946 winter wheat crops covering about 300,000 farms. It is thus probable that insurance for all commodities in 1946 will cover more than one-half million farms, reaching at least the amount of insurance in 1943 before the program was discontinued. Corn trial insurance is written in 1945 in 15 counties and tobacco trial insurance in 13 counties.

Commodity	No. of Applications	No. of Farms Covered
Cotton	95,756	113,183
Spring Wheat	14,390	23,394
Flax	31,131	38,072
Corn	10,603	12,363
Tobacco	12,564	12,288
Total	164,444	199,300

Insurance is against losses due to unavoidable causes. Insurance on wheat, cotton, and flax is against loss of yield. Insurance coverage on these crops may be either 75 per cent or 50 per cent of the long-time average yield for the insured farm. If the yield in the year of insurance is less than the coverage, the grower is indemnified for the shortage. The premium rate is based on the risk of producing the commodity. Premiums and indemnities are computed in bushels of wheat or flax and pounds of cotton, but payment is usually in the cash equivalent thereof.

Two plans of trial insurance are offered on corn and tobacco. One plan is against loss of investment in the crop, with a coverage of 75 per cent of the investment as determined by the corporation. If the returns from the crop in the year of insurance are less than the coverage, the grower is indemnified for the shortage. The second plan of insurance on corn is against loss of yield—the same plan as used for wheat, cotton and flax. The second plan for tobacco is against not only loss of yield but also loss of quality. The amount of coverage is a dollar figure determined at the end of the season by multiplying 75 per cent of the farm average yield by an average or representative price for tobacco in the year of insurance, as adjusted upward or downward to reflect the experience of the insured for previous years in selling at prices above or below the market average. If the insured's returns from his crop are less than this figure, he is indemnified for the shortage.

The amount of insurance protection is modified somewhat for all commodities in circumstances where the insured grower does not incur the full cost of producing and harvesting the crop. If a complete loss occurs early in the growing season, but after it is too late to replant to the insured crop, the amount of protection is 40 to 50 per cent (depending upon the commodity) of the maximum coverage. From there on, the amount of protection increases progressively with the stages of the crop.

The corporation has three sources of funds: (1) premiums which are set at what is believed adequate to cover average crop losses plus reserves against unforeseen losses, (2) a capital provided by the government to absorb year-to-year fluctuations in losses, and (3) an annual appropriation to cover costs of administration. The government's contribution in the form of capital and annual appropriations for administration is based on the public welfare aspect of the program.

Participation in the program by growers is voluntary. A 3-year contract is used for wheat and a 1-year contract for the other commodities. Federal crop insurance is administered in states and counties by committees of the Field Service

Branch of the Production and Marketing Administration and the staff of the state directors of the corporation.

J. CARL WRIGHT,
Manager, Federal Crop Insurance Corporation.

FEDERAL DEPOSIT INSURANCE CORPORATION.

According to the report of the board of directors, the income of the corporation for the year ended June 30, 1945, amounted to \$112,746,000, derived from the following sources: \$86,383,000 assessments paid by insured banks, \$25,936,000 interest earned and profits from sales of securities less provision for amortization of premiums, and \$427,000 other income. Total losses and expenses for the year amounted to \$4,029,000, divided between deposit insurance losses and expenses of \$210,000 and administrative expenses and other charges of \$3,819,000.

The surplus of the corporation on June 30, 1945, was \$579,169,000 resulting from an excess of income over expenses and losses during the entire period of operations. Total income from the beginning of deposit insurance on Jan. 1, 1934, to June 30, 1945, amounted to \$653,682,000 including assessments of \$514,859,000 paid by insured banks, \$137,000,000 derived from interest earned and profits from sales of securities after making provision for amortization of premiums, and other income of \$1,823,000. Charges to surplus amounted to \$74,513,000. Net deposit insurance losses and expenses amounted to \$34,828,000, the difference between total disbursements of \$298,815,000 actually made or pending to protect depositors of weak or insolvent insured banks and estimated recoveries of \$263,987,000. Administrative expenses and other charges amounted to \$39,685,000.

On June 30, 1945, the balance sheet of the corporation showed total assets amounting to \$870,111,000 including \$838,071,000 in United States government securities and accrued interest receivable and \$10,774,000 in cash on hand. Capital accounts included capital stock of \$289,300,000 and surplus of \$579,169,000. Liabilities totaled only \$1,642,000.

The Federal Deposit Insurance Corporation insured deposits in 13,474 operating banks with total deposits amounting to \$143,954,000,000 of which approximately \$55,000,000,000 were covered by the maximum insurance of \$5,000 for each depositor on June 30, 1945. During the year ended on that date the number of insured banks increased by 13. Of the 101 banks admitted to insurance, 23 were in operation on June 30, 1944, and 78 opened for business after that date. There were 88 banks eliminated: 1 by merger with financial aid from the corporation and the remainder by voluntary merger, consolidation, or liquidation. In the one insured bank merged with financial aid from the corporation, all of the 12,484 depositors having total deposits of \$5,695,000 were fully protected from loss by the terms of the merger agreement.

By June 30, 1945, 398 insured banks, having 1,309,703 depositors with total deposits of \$504,929,000, had been liquidated or merged with the aid of loans from the corporation. Deposits amounting to \$493,851,000, 97.8 per cent of the total deposits in the 398 banks, were made available promptly without loss to the depositors. Only 2,113 of the 1,309,703 depositors, or less than one sixth of 1 per cent, held accounts in excess of \$5,000 which were not fully protected by insurance, offset, preferment, pledge of security, or terms of the merger agreements.

Federal Credit Unions.—On June 30, 1945, there were 3,800 federal credit unions in operation. These co-operative associations were organized in accordance with the Federal Credit Union Act, as amended (Title 12 U.S.C. 1751-1771) for the purpose of promoting thrift among their members and creating a source of credit for provident or productive purposes.

Effective May 16, 1942, the responsibility for the chartering and supervision of federal credit unions was transferred from the Farm Credit Administration and the governor thereof to the Federal Deposit Insurance Corporation by Executive Order No. 9148 of April 27, 1942. However, share balances in credit unions are not insured by the Federal Deposit Insurance Corporation.

HOMER JONES,
Chief, Division of Research and Statistics, Federal Deposit Insurance Corporation.

FEDERAL HOME LOAN BANK ADMINISTRATION. See NATIONAL HOUSING AGENCY, Section 2.
FEDERAL HOUSING ADMINISTRATION. See NATIONAL HOUSING AGENCY, Section 3.

FEDERAL POWER COMMISSION. In its past year, its 25th, the commission continued its regulatory work and other responsibilities under the Federal Power Act, the Natural Gas Act, Flood Control Acts, and its other jurisdictional statutes and executive orders, beginning the transition from wartime to peacetime activities.

The year was marked by important court decisions settling disputed jurisdictional questions and firmly establishing the commission's authority to use the prudent investment rate base.

The case of *The California Oregon Power Company v. Federal Power Commission*, decided by the U.S. Circuit Court of Appeals for the Ninth Circuit on June 15, 1945, sustained the accounting power of the commission to order amortization of excess over acquisition cost representing payments for intangibles classified in Account 100.5 of the commission's Uniform System of Accounts. In *Arkansas Power & Light Company v. Federal Power Commission*, decided June 6, 1945, by the U.S. District Court for the District of Columbia, a complaint asking for an injunction against a hearing in a commission accounting case was denied on the authority of *Northwestern Electric Co. v. Federal Power Commission*, 321 U.S. 119, in which case the United States Supreme Court had generally sustained the commission's accounting jurisdiction.

The prudent investment rate base principle, adopted by the commission in its rate cases and approved by the United States Supreme Court in the Natural Gas Pipeline Company and Hope Natural Gas Company cases, has become firmly established as a result of the decisions during the past year of the Supreme Court in the cases of *Colorado Interstate Gas Company v. Federal Power Commission*, *Canadian River Gas Company v. Federal Power Commission*, *Colorado-Wyoming Gas Company v. Federal Power Commission*, and *Panhandle Eastern Pipe Line Company v. Federal Power Commission*. Under the latter case, the commission may exclude all evidence of reproduction cost. These cases also sustained the commission in including in the rate base production and gathering properties owned and used by the natural-gas company whose rates are regulated.

No changes have been made in the commission's jurisdictional statutes, except by certain provisions in the Flood Control Act of 1944,

enacted Dec. 22, 1944, one of which requires approval of the commission for all rate schedules for the sale by the Secretary of the Interior of electric energy generated at reservoir projects under the control of the War Department and, in the opinion of the Secretary of War, not required in the operation of the projects. This is similar to the approval of rates by the commission required by the Bonneville Act, the Fort Peck Act and, by executive order, as to the Denison, Grand River and Norfolk dams. The commission recently made an allocation of cost of the Bonneville project as between power and other purposes.

In addition to its licensing of hydroelectric power projects on navigable streams or government lands, the commission continued its regulation of the interstate wholesale rates and accounts of electric public utilities and natural-gas companies. As a result of these activities, write-ups and other inflationary items totaling \$881,000,000 had been eliminated from plant accounts by Sept. 1, 1945, and reductions in rates approximating \$40,000,000 annually or a cumulative total of \$100,000,000 had been achieved.

Since Feb. 7, 1942, when Section 7 of the Natural Gas Act was amended, the commission has had considerable activity in issuing certificates of public convenience and necessity covering the construction, operation and acquisition of facilities for the transportation and sale of natural gas in interstate commerce. Since the amendatory date of the act to Sept. 1, 1945, certificates were issued for the construction and operation of new facilities with an estimated cost of \$158,000,000 and for the acquisition of facilities with a book cost totaling \$224,000,000. In the first eight months of 1945, such certificates authorized \$42,000,000 in new construction and \$28,000,000 in book cost of facilities acquired.

In connection with its gas certificate work, the commission encountered the conservation problem and the problem of end uses of natural gas. As a result, the commission, within the year, instituted a general investigation into the conservation and utilization of natural gas, scheduling hearings throughout the remainder of the year 1945. This investigation has been undertaken to determine the extent and probable life of the nation's natural gas reserves, the extent and probable future utilization of natural gas for domestic, commercial and industrial purposes, the extent, character and results of the competition of natural gas with other fuels, and what additional legislation, if any, should be recommended to Congress.

Under Flood Control Acts and the Rivers and Harbors Act of 1945 the commission investigated during the fiscal year 1945 the power possibilities of over 300 flood control and other reservoir projects involving 27 river basins covering 24 states. Surveys for several sections of the country regarding utilization and marketing of electric power from existing and future hydroelectric development have been completed and others are under way.

During the year the commission staff participated in several co-operative studies and reports with members of the Federal Inter-Agency River Basin Committee, formed in December 1944, by joint agreement between the Federal Power Commission, the departments of War, Interior and Agriculture, under which agencies of these departments and the commission co-operate and correlate results of their multiple-purpose river basin project activities.

The commission continued activities for the war effort including the internal security program for the protection of electric and gas plants and facilities from sabotage and other hostile acts. In January 1944, by request of the War Department, the commission assumed sole responsibility for all future protection work. Other war work included surveys and reports of power resources and war power requirements, reports for use of war agencies on electric power supply in enemy and enemy-occupied countries covering most of Europe and the Far East, and emergency interconnection of facilities. Under presidential directive of 1942 it continued also to render assistance in securing adequate power at reasonable rates for war requirements of the federal government. Through August 1945 over 1,100 contracts involving an estimated annual bill of approximately \$200,000,000 had been filed with the commission for review. This joint effort of the commission and the procurement agencies has resulted in aggregate savings of approximately \$25,000,000.

The commission published during 1945 another edition of its annual series of *Typical Electric Bills*, showing that the average charge per kilowatt-hour for residential electricity in cities of 50,000 population or more decreased nearly 40 per cent in the last 20 years. The publication also shows that wide variations in charges for the same quantity and kind of electric service in different cities continued, the greatest spread for 100 kilowatt-hours per month being 390.5 per cent.

The commission published a volume entitled *Industrial Electric Power in the United States*, showing that total production of electric energy for public and industrial uses in 1944 was approximately 280 billion kilowatt-hours, an increase since 1939 of 73.3 per cent.

During 1945 the commission continued to make monthly statistical reports to the industry on power supply, consumption of fuel for the generation of electricity and related data, and continued to publish its *National Electric Rate Book* and *Statistics of Electric Utilities*. It also issued Volume III of its reported opinions and decisions.

LEON M. FUQUAY,
Secretary, Federal Power Commission.

FEDERAL PRISON INDUSTRIES, Inc. Operating under the general supervision of the Attorney General, this government corporation was organized for the express purpose of providing constructive employment and industrial and vocational training for as large a number as possible of the inmates in the federal penal and correctional institutions. The corporation was created by an executive order of the president dated Dec. 11, 1934, pursuant to the act of Congress approved June 23, 1934. A nonsalaried board of directors, consisting of five members representing labor, industry, retailers and consumers, agriculture and the attorney general are appointed by the president. This board formulates the policies and reviews, generally, the functions and operations of the corporation. The board of directors also appoints the commissioner of industries, who serves as the chief executive officer of the corporation. All commodities manufactured in the various federal prison industries are sold only to other federal government departments and agencies.

During the 1944-45 fiscal year, the corporation operated 54 factories and shops in 22 of the institutions in the Federal Prison System, which

employed an average of 3,618 inmates. The total value of goods produced during this year amounted to \$17,557,498, out of which \$957,489 was paid out in inmate wages. Approximately 75 per cent of all inmate wages were paid to their dependents. As in the previous war years, 98 per cent of all sales were again made to the armed services and other war agencies of the government. The goods produced included such articles as work gloves, mattresses and beds for the army and navy, parachutes for the Weather Bureau, barracks bags, sea bags, tarpaulins, canvas shell covers, canvas water tanks, army shoes, tool racks, tool chests, food trays, bedside cabinets for hospital use, cargo nets and camouflage nets, pallets for warehouses, brooms and brushes of various kinds, canned goods and dehydrated products, mosquito bar frames and artificial limbs, wood and fiber furniture. Other activities of a service nature consisted of the salvage of large amounts of copper wire and cable, laundry work for both army and navy installation, and field printing for numerous government agencies.

In addition to the actual production of goods, the corporation has been financing an increasingly comprehensive vocational and trade training program. During the war years the training program emphasized primarily training for war production industries which provided opportunities for placement. A little over 1,900 men were enrolled in a variety of training courses in welding, sheet-metal, machine shop, aircraft mechanics, auto mechanics, and drafting. A major portion of this training program was conducted in conjunction with the nationwide war production training program sponsored by the United States Office of Education. Since this particular program was being discontinued throughout the country towards the end of the fiscal year, the vocational training program in the federal penal and correctional institutions was being redirected towards peacetime and more long range objectives.

One of the most unique training projects in prison or reformatory treatment is the Airplane Mechanics School at the Federal Reformatory, Chillicothe, Ohio. This is a central school furnishing full time training for a group of men carefully selected from the reformatory as well as from other federal institutions. The course covers a full year's training and during the past year, 92 students were enrolled and 33 were graduated and released. Of this group, 12 obtained civil service status and were placed in Army Air Force Depots, 10 were placed in aircraft industries, 2 were placed in other industries in Allied occupation, 3 were placed with commercial airlines or airports, and 6 were inducted into the army. It is anticipated that with some additions in equipment and minor changes in the training course, this school will be certified by the Civil Aeronautics Administration as an approved airplane mechanics school.

A. H. CONNER,
Associate Commissioner, Federal Prison
Industries, Inc.

FEDERAL PUBLIC HOUSING AUTHORITY. See NATIONAL HOUSING AGENCY, Section 4.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION. See NATIONAL HOUSING AGENCY, Section 2.

FEDERAL SECURITY AGENCY (FSA). Created under the President's first plan of government reorganization authorized by the Reorganization Act of 1939, the purpose of this agency is to

promote "social and economic security, educational opportunity, and the health of the citizens of the Nation." To that end, it brings together government agencies having related responsibilities in these broad fields. As at present constituted, the constituent units of the agency are the Public Health Service (q.v.) under which is Freedmen's Hospital; the Office of Education; the Social Security Board (q.v.); the Food and Drug Administration (q.v.); St. Elizabeths Hospital; the Office of Vocational Rehabilitation. The agency also represents federal participation in the work of the American Printing House for the Blind; Howard University; and Columbia Institution for the Deaf. The direction of the agency is in the hands of the Federal Security Administrator.

Office of Community War Services.—The Office of Community War Services, which has served as the war arm of the Federal Security Agency, continued its services in helping communities to provide health, medical care, welfare, recreation, education, social protection, and related services to families and individuals in war-affected areas. Because of the approaching close and finally the end of the war, these activities are somewhat reduced in scope, and in some instances changed in emphasis.

The two major functions of the Office of Community War Services have been carried on by its two main divisions, Social Protection, and Recreation. The Social Protection Division, while continuing its co-operation with the army, and the navy, and with the United States Public Health Service, has worked closely with local officials and agencies to stimulate community action to prevent an increase of the ills of venereal disease and prostitution during the period of demobilization.

Strong efforts have been made to hold the gains in the 700 towns where red light districts have been closed. Local social protection committees have been strengthened and increased in number and several state committees have been organized to aid communities in meeting their social protection problems.

The Recreation Division, before the restriction of its activities by budget curtailment after V-E Day, carried on its work to help communities develop their recreation programs and to get added facilities and personnel. It continued to encourage programs for youth and conducted a nationwide survey of teen-age centers which resulted in a publication on the subject. In the new fiscal year the division has restricted its activities largely to carrying on its responsibility in relation to the USO (United Service Organization) in the maintenance and operation of 400 recreation buildings built with federal funds.

Although the end of the war restricted some of the activities of the Office of Community War Services, many activities begun as war projects have continued to gain in momentum.

Public Health Service.—The United States Public Health Service is the principal federal agency responsible for the promotion of national health. See PUBLIC HEALTH SERVICE, U. S.

Freedmen's Hospital. established in 1865, is administered by the Public Health Service, and is affiliated with Howard University Medical School. It is a general hospital with specialized departments, and is approved by the American College of Surgeons and the American Medical Association.

Food and Drug Administration.—This administration enforces five federal acts of which the one

of greatest interest to the greatest number of people is the Food, Drug and Cosmetic Act of 1938, which superseded the Food and Drugs Act of 1906, commonly called the "Pure Food Law." See FOOD AND DRUG ADMINISTRATION.

Office of Education.—This office was established by Congress in 1867 "for the purpose of collecting such statistics and facts as shall show the condition and progress of education in several states and territories, and of diffusing such information . . . as shall aid the people of the United States in the establishment and maintenance of efficient school systems, and otherwise promote the cause of education throughout the country." The major divisions of the office include Elementary, Secondary, Vocation, and Higher Education, School Administration, International Education Relations, and Auxiliary Services. In addition to its regular activities of research, consultation, surveys and publications, the office administers grants-in-aid to the states for vocational education of less-than-college-grade and to land-grant colleges and universities.

Special war training programs on college level and less than college level authorized by Congress continued to be administered by the Office of Education until terminated June 30, 1945. Beginning on July 1, 1940, and ending June 30, 1945, these programs received almost \$500,000,000 in federal appropriations to carry on war training activities. Through these programs more than 13,000,000 persons received free training in war production occupations during the five years the programs operated. See also EDUCATION, REVIEW OF.

Social Security Board.—This board was established in 1935 to administer the provisions of the Social Security Act dealing with old age and survivors insurance, unemployment compensation and public assistance to the needy aged, needy blind, and dependent children. See SOCIAL SECURITY BOARD.

Office of Vocational Rehabilitation.—This agency administers the Vocational Rehabilitation Act of July 6, 1943, which provides for the expansion of the federal-state program for rehabilitation of physically handicapped civilians. The law makes federal money available to states for remedial treatment as well as vocational training, and specifically provides for vocational rehabilitation of persons injured in nonmilitary war services.

St. Elizabeths Hospital.—This hospital was established by Congress in 1855. It provides treatment for the mentally ill among members of the armed forces, residents of the District of Columbia, Indians under the Bureau of Indian Affairs of the Department of the Interior, and certain other civilian groups. Psychiatric instruction is given to undergraduates, postgraduate students of the army and navy medical schools, and the medical schools of Georgetown and Howard universities. Various medical officers from the army, navy and Veterans' Administration are detailed to the hospital for training. Student nurses are given both general and psychiatric training in the nursing school of the hospital.

Howard University.—Located in Washington, D.C., this institution is supported jointly by Congressional appropriations and private funds for the higher education of the colored youth of the nation.

Columbia Institute for the Deaf.—All deaf mutes of teachable age of the District of Columbia are admitted to Columbia Institute for the Deaf without charge. The advanced department, known as Gallaudet College, offers the only advanced

course especially for deaf students given anywhere in the world. Congress maintains a definite number of free scholarships in this department for qualified deaf students from the states and territories.

American Printing House for the Blind.—This institution is located at Louisville, Ky., and assists public institutions in the education of blind youth by providing them with embossed books, recorded talking books, and apparatus for schools of the blind.

WATSON B. MILLER,

Acting Administrator, Federal Security Agency.

FEDERAL TRADE COMMISSION. An administrative agency of the federal government, organized March 16, 1915, under the Federal Trade Commission Act, which was approved Sept. 26, 1914, and amended March 21, 1938, by the Wheeler-Lea Act. Members of the commission are William A. Ayres, Kansas, chairman; Garland S. Ferguson, North Carolina; Ewin L. Davis, Tennessee; Robert E. Freer, Ohio, and Lowell B. Mason, Illinois. The commissioners are appointed by the president and confirmed by the Senate, each to serve seven years and not more than three to be of the same political party. In the event of a vacancy, the new member is appointed for the unexpired term of the commissioner he succeeds. The chairmanship of the commission rotates annually among its members.

The principal duties of the commission are (1) to promote free and fair competition in interstate trade in the interest of the public through prevention of price-fixing agreements, restraint-of-trade combinations, boycotts, unlawful price discriminations, and other unfair methods of competition and unfair and deceptive acts or practices; (2) to safeguard the life and health of the consuming public by preventing the dissemination of false advertisements of food, drugs, devices and cosmetics which may be injurious, and (3) to conduct investigations of a general or special character upon its own initiative, upon the direction of the president or the Congress, or upon application of the attorney general.

Investigations.—Continuing its general investigation, initiated in 1940, of methods and costs of distributing important consumer commodities, the commission in the 1945 fiscal year transmitted to Congress additional reports relating to advertising as a factor in distribution; milk distribution, prices, spreads and profits; and cost of production and distribution of fish in the Great Lakes Area and in New England. Previous reports dealt with food products, building materials, petroleum products, automobiles, rubber tires and tubes, electrical household appliances, and agricultural implements.

An investigation of the cigarette shortage among civilians was undertaken by the commission after it had received complaints from the public and distributors and a request from the chairman of the Senate Interstate Commerce Committee that such an inquiry be made. The commission reported that the shortage was caused principally by the diversion of a high percentage of total cigarette production to the armed forces and the Allies and was not attributable to violations of any laws under its jurisdiction.

Legal Activities.—Legal activities of the commission embrace administration of (1) the Federal Trade Commission Act which declares that unfair methods of competition and unfair or deceptive acts or practices in commerce are unlawful; (2) Section 2 of the Clayton Act, as amended

by the Robinson-Patman Act, dealing with price and other discriminations, and Sections 3, 7, and 8 of the same act which prohibit, respectively, exclusive-dealing contracts, acquisitions of capital stock, and interlocking directorates; (3) the Export Trade (Webb-Pomerene) Act, which, for the purpose of promoting foreign trade, permits the organization of associations to engage exclusively in export trade under stated restrictions; and (4) the Wool Products Labeling Act, designed to protect industry, trade and the consumer against the evils resulting from the unrevealed presence of substitutes and mixtures in woolen products.

Complaints and Orders.—Under its statutory procedure the commission during the fiscal year issued 164 complaints alleging violations of the laws it administers and entered 140 orders to cease and desist from such violations. Of the complaints issued under the Federal Trade Commission Act, three involved price-fixing and restraint-of-trade combinations and 112 false and misleading advertising of various products, of which 30 alleged misrepresentation of the therapeutic properties of medicinal preparations. Thirteen complaints charged violation of the Wool Products Labeling Act and 22, violation of the Clayton Act as amended by the Robinson-Patman Act.

Among the orders to cease and desist, nine were directed against collusive bidding on government contracts; seven against price-fixing and restraint-of-trade combinations; 22 against violations of the Robinson-Patman Act; and three against violators of the Wool Products Labeling Act. The large majority of the other orders involved violations of the Federal Trade Commission Act.

Stipulations.—The commission under certain circumstances permits the respondent in a proceeding to sign a statement of fact and an agreement to discontinue the unfair practice involved. This stipulation procedure is a simplified and effective method of disposing of a case and saves both the government and the respondent the expense incident to trial of a complaint. During the fiscal year, 286 such stipulations were accepted, 66 pertaining especially to false claims made in radio and periodical advertising. The commission always reserves the right, for any reason it regards as sufficient, to refuse to extend the privilege of stipulation.

Court Cases.—United States Courts decided 27 cases in favor of the commission during the year, in two of which the Supreme Court of the United States sustained orders of the commission directed against use by two glucose manufacturers of the basing-point system of delivered prices. Circuit courts of appeals affirmed 16 orders to cease and desist, four with modifications. In six cases district courts entered judgments for civil penalties totaling \$10,182 for violation of commission orders which had become final.

Trade Practice Conference Work.—The trade practice conference procedure provides a means whereby members of an industry may voluntarily co-operate with the commission in the formulation and establishment of trade practice rules having for their purpose the wholesale elimination of unfair methods of competition and other illegal acts and practices. Rules were approved and promulgated during the year for the following industries: Button jobbing, hearing aid, low pressure refrigerants, razor and razor blade, water heater, wood-cased lead pencil, and tuna (revised and extended rules). Trade practice rules are

administered by the commission for more than 150 industries.

Wool Products Labeling Act.—This act provides that products containing or purporting to contain wool, reprocessed wool or reused wool shall be labeled so as to disclose their true fiber content, thus protecting the consumer as well as manufacturers, distributors and other marketers from the unrevealed presence of substitutes and mixtures. The act was given wide application during the year. Field inspections were made of more than 1½ million products subject to the labeling provisions of the act and covered the labeling practices of several thousand concerns.

Radio and Periodical Advertising.—The commission during the fiscal year examined some 301,000 newspapers, magazine, catalog and other periodical advertisements and 562,260 commercial radio continuities, of which 17,260 published advertisements and 10,574 broadcast statements were designated for further review as containing representations that might be false and misleading. Where it appeared that an advertisement was false or misleading, the case was disposed of through the stipulation procedure or by the complaint and trial method.

Export Trade Act.—Under the provisions of this act, the commission during the year conducted investigations as to the operation of several export trade associations. One inquiry was completed and resulted in the commission making recommendations for the readjustment of the business of the Florida Hard Rock Phosphate Export Association. At the close of the year, 49 export associations were registered with the commission and were operating under the act.

OTIS B. JOHNSON,
Secretary, Federal Trade Commission.

FEDERAL WORKS AGENCY. Immediately after Japan's acceptance of the Potsdam Declaration on August 14, 1945, the constituent units of this agency—the Public Buildings Administration, the Public Roads Administration (see HIGHWAYS) and the Bureau of Community Facilities—began the liquidation of their war-connected activities and concentrated upon construction activities for peace.

Bureau of Community Facilities.—Responsibility for the administration of Titles II and IV of the Lanham Act, under which war-congested communities were assisted in the construction, operation and maintenance of necessary community facilities, was assigned to a new Bureau of Community Facilities created as of Jan. 1, 1945. In addition, the bureau was made responsible for administering the advance planning program of state and local postwar public works authorized by Title V of the War Mobilization and Reconversion Act of 1944.

To carry on activities under Title II of the Lanham Act during the fiscal year 1946, the previous authorization of \$500,000,000 was increased by \$30,000,000, and a new appropriation of \$20,000,000 was added to previous appropriations totaling \$497,000,000.

Projects completed, or in the preconstruction stage, as of June 30, 1945, included 1,131 schools, 810 general hospitals, 727 recreation facilities, 456 water systems, 441 sewer systems, and lesser numbers of venereal disease hospitals—a program carried out in co-operation with the United States Public Health Service—fire and police stations, streets and highways and miscellaneous facilities.

The generally improved financial position of

ing the fiscal year 1945, the communities financed 38.7 per cent of their Lanham Act construction as compared with only 20 per cent in the three previous fiscal years.

Gross federal allotments for war public services (maintenance and operation) totaled \$45,799,984 in the fiscal year 1945, as follows: child care, \$18,639,440; regular school services, \$16,281,337; venereal disease treatment centers, \$5,166,255; recreation centers, \$3,147,412; other services, \$2,565,540.

On August 15, 1945, division engineers of the bureau were instructed by the administrator to suspend Lanham Act construction wherever possible, and to cancel contracts for the construction of facilities upon which actual work had not yet begun.

Commitments already made toward the financial support of regular school programs during the school year beginning in September were to be carried out.

Because many of the children in the child-care centers were sons and daughters of servicemen still overseas, the administrator asked the Congress to consider the advisability of authorizing continuation beyond October 31 of some of the centers. Congress authorized the operation to be continued until March 1, 1946.

Lanham Act facilities built wholly at federal expense were to be sold, wherever possible, to the local communities.

Title V of the War Mobilization and Reconversion Act of 1944 authorizes the administrator to make advances, from such funds as are appropriated for the purpose, to states and their political subdivisions to assist in the planning of public works. For this purpose \$17,500,000 was appropriated, 90 per cent of the available funds to be allocated among the states in proportion to population.

As of Oct. 31, 1945, 1,418 applications for \$10,107,645 with which to plan construction of public works to cost \$351,107,327 had been approved. All advances are to be repaid to the federal government when construction of projects so planned is begun.

Public Buildings Administration.—Because of the scarcity of materials, no permanent federal buildings were constructed during the war. In the summer of 1945 two permanent buildings were under construction—a \$1,200,000 laboratory for the study of tropical diseases at Bethesda, Md., for the United States Public Health Service, and a \$2,600,000 federal office building at Suitland, Md.

The total cost of all PBA construction in fiscal year 1945, including Lanham Act construction assigned by the administrator, temporary federal buildings and war housing, was \$14,007,971. In addition, repairs and alterations to buildings totaled \$1,420,445, while the maintenance and operation of federal buildings in the District of Columbia involved an expenditure of \$32,882,440.

PBA was awaiting Congressional authorization of a large program of needed construction of post offices, court houses, and other federal buildings.

PHILIP B. FLEMING,
Major General, U.S.A.; Federal Works Administrator.

FEDERATED MALAY STATES. See BRITISH MALAYA.

FELDSPAR. Stimulated by the active market for glass and glass products, a heavy demand

and sanitary pottery, and despite labor shortages, the outputs of both crude and ground feldspar in 1944 increased in comparison with 1943 figures, according to the United States Bureau of Mines. Domestic sales of crude feldspar in 1944 totaled 327,408 long tons valued at \$1,813,937, a 6.2 per cent increase in quantity over 1943. The total value of crude spar sold in 1944 reached a new high and was 10 per cent above the \$1,646,277 reported in 1943, the highest previous year. Sales of ground feldspar by merchant mills advanced to 343,201 short tons valued at \$3,863,036, representing a 2.2 per cent increase in quantity and a 7.5 per cent increase in value over 1943. In tonnage, both crude and ground feldspar were only 3 per cent under the record year of 1941.

FERGUSON, John Calvin, American educator: b. Ontario, Canada, March 1, 1866; d. Clifton Springs, N.Y., Aug. 3, 1945. Dr. Ferguson lived in China for 56 years and was the founder and first president of Nanking University, adviser to several Chinese governments, former publisher of two Chinese newspapers, and an authority on Chinese art. Dr. Ferguson received a B.A. degree from Boston University in 1886 and a Ph.D. degree in 1902. He was sent to China in 1887 by the Methodist Episcopal Church to establish Nanking University, and served as its president from 1888 to 1897. From 1897 to 1902 he was president of Nanyang College in Shanghai. Winning the confidence of the ruling men in China, he served as foreign adviser to the viceroys of Nanking (1898-1911), and of Wuchang (1900-10), and was appointed secretary to the Chinese Ministry of Commerce in 1902. As such, he was a member of the Chinese commission for the revision of treaties with the United States, Great Britain, and Japan in 1902 and 1903. On seven occasions between the years 1901 and 1919 he was sent by the Chinese government on special missions to the United States. He was counselor to the Chinese Department of State (1915-17) and adviser to the president of the Republic of China (1917-28). His last post in China was that of adviser to the Executive Yuan of the National Government. Dr. Ferguson was the owner and publisher of the Shanghai daily newspaper, *Sin Wan Pao* from 1899 to 1929, and also of the Shanghai *Times* from 1907 to 1911. Dr. Ferguson reached the United States in December 1943 on the exchange ship *Gripsholm*, having been freed from a long period of internment in Peiping by the Japanese.

FIELD MUSEUM OF NATURAL HISTORY. See CHICAGO NATURAL HISTORY MUSEUM.

Fiji. A British colony in the South Pacific, consisting of some 250 islands having an aggregate area of 7,083 square miles. Only 80 of the islands are inhabited, the largest being Viti Levu (4,053 square miles) and Vanua Levu (2,128 square miles); 220 miles northwest of the Fijian archipelago lies Rotuma (14 square miles), principal of a cluster of small islands constituting a dependency of the colony of Fiji. At the census of Dec. 31, 1944, the population totaled 246,485, comprising Fijians (113,179), Indians (113,147), mixed white and native blood (5,781), whites (5,254), Rotumans (3,363), Chinese (2,406), and others (3,355).

The governor of the colony (Sir Alexander W. G. H. Grantham assumed office Jan. 9, 1945)

is also ex officio high commissioner for the (British) Western Pacific Islands (q.v.). The Legislative Council is composed of the governor as president, 16 official members, 5 white members (3 elected and 2 nominated), 5 Fijians (nominated chiefs), and 5 Indians (3 elected and 2 nominated). The 1945 budget provided for revenue of £1,369,000 and an expenditure of £1,679,000; the estimated deficit of £310,000, and any deficit in the 1944 accounts, would be covered by a surplus of £310,560 in the 1943 accounts. Local government was placed almost wholly in the hands of the Fijian Affairs Board, newly constituted on Jan. 1, 1945. The chairman was the secretary for Fijian affairs (formerly known as adviser on native affairs), and membership comprised the 5 Fijian members of the Legislative Council and a legal adviser. Major Ratu (chief) J. L. V. Sakuna, secretary for Fijian affairs, was ex officio a member of the colony's Executive Council, the first Fijian to be so seated. In 1944 the total enrolment in the 384 schools, public and private, was 30,396, the government expending £55,754 on education. At Suva (pop. 15,552), the capital, is a Central Medical School, assisted by the Rockefeller Foundation, which trains students from all British territories in the Southwest Pacific; and an associated nursing school is open to native student nurses from all the islands.

Sugar cane (50,000 acres under cultivation in 1942-43) was, for long, the principal economic crop; exports in 1943 declined to 92,528 tons, one third less than the total for 1942. The banana industry (2,000 acres) languished both in quantity and quality; and coconut plantations (130,700 acres) yielded only 17,717 tons of copra in 1943. Rubber output in 1943, however, rose to 243,946 pounds (as against 31,472 pounds in 1939). The forest area of 2,366,000 acres yielded good grades of hard and soft woods. The Fijian gold mines (Emperor and Loloma) made Fiji the third largest producer among British colonial territories. Since the departure of the American forces, which garrisoned the islands early in the war against Japan, there has been a big demand from the United States for cat's-eyes, from pethelatus shell; this has created a new industry on the Tailevu coast, where the natives, formerly poor, are gaining great wealth. Other exports include trocas shell, molasses, biscuits, pineapples, hides, coconut oil, and soap. Total exports in 1943 were valued at £1,819,054; and imports at £2,639,257, principally clothing and other textile materials, flour, and supplies for industry.

There is a 120-mile narrow gauge railroad on Viti Levu owned by a sugar company, and a highway encircles the island. Suva is a regular port of call for steamships from Canada, Australia, and New Zealand; and prior to the war with Japan it was a way station on the Pan American Airways service between San Francisco and New Zealand.

In 1941 the Fiji Infantry Regiment was brought into battle shape, and with arrival of United States forces the following year, the islanders provided labor units, food, and supplies for them. Fijian guerrillas, known to the Americans as the "South Pacific Scouts," served with the United States 14th Corps until 1944 in the recapture of the Solomons.

FINANCIAL AND ECONOMIC REVIEW. The ending of the war with Germany (May 8, 1945) and with Japan (Aug. 14, 1945)—the latter earlier than was generally looked for—brought to the

country a number of problems of the most serious kind. The first of these problems had to do with the bringing back into the pursuits of peace of some 12,000,000 persons employed in military service, and the second with the transferring to those pursuits of approximately the same number of persons that were engaged in supplying the munitions and services which the military operations required. So rapidly was the first of these problems being met in part, that it was expected that by July 1, 1946, those remaining in the military services would be reduced below 2,000,000. But the re-employment of the millions set free from military duty was a problem whose solution remained. Unemployment on a large scale, at least temporarily, could not be avoided. Estimates of the number of unemployed in the latter months of 1945 varied from 5,000,000 to much higher figures in 1946. But whatever the correct number that might remain unemployed at either of the periods indicated, the fact is indisputable that the number to be absorbed in production and trade will be of large proportions, constituting a problem of serious magnitude. It is the prevailing opinion that those freed from military service—and others as well—are rightfully entitled to find work. Private enterprise must provide such opportunity to the extent possible, the deficiency to be supplied by a limited program of public works. For private enterprise to meet this demand, time was necessary, as the major industries of the country had been for several years engaged in supplying the demand for munitions and various kinds of military equipment. They could not immediately refashion their plants for peacetime production. Unavoidably, large numbers found themselves out of work almost as soon as the war ended. Fortunately, in a number of cases—notably in the automotive industry—preparations had been made in advance for the process of reconversion so that the delay was measurably shortened.

While the war was going on, a shortage of manpower existed, but with peace an entire change took place. While unemployment was engaging the attention of the country in the autumn of 1945, in September of that year those remaining idle because of strikes was in the neighborhood of 500,000, the greatest number in recent years for any one month, with the exception of May 1943. As a rule, the stoppage of work was due to failure to secure the higher wages the employees demanded. This demand was based on increased cost of living and on the large profits which many industries had realized during the war. It is the contention of industrialists that they cannot for any long period advance wages unless they are allowed to increase the price of their products. To do so, they urge, would be to encroach on their reserves, which must be maintained in order to provide for emergencies and expansion. That improved methods of production can be relied on to meet the added cost of raising wages, they point out, has its limitations. If increased wages bring an increase in price, we are in the vicious spiral where one objective ineffectually pursues the other; or as declared by an antique authority, "he that earns wages, earns wages to put into a bag with holes." Irrespective of what may be the effect of increased wages on the cost of living, by early October the prevalence of strikes had become so widespread, and with such enormous loss to the wage-earners, to producers, business generally and the public at large, that the country reached the widely held opinion that some method of set-

ting labor disputes less costly than strikes must be found that will insure a large degree of justice to all.

For some three and one half years the United States devoted a large part of its resources and energy to the production of goods used for destructive purposes. However necessary this may have been, it must be recognized that the net result was relative impoverishment. The country has not been made richer by the war, but poorer. And the comparative poverty thus brought about cannot be repaired by clever financial schemes of any kind, by huge and extravagant outlays, or by shortcuts of any sort. There is no easy way back to economic and financial health. The hard way—unremitting work and saving—is the only right way, however unalluring it may be. Thousands of trucks, tanks, and other forms of military equipments lie rusting away in junk-heaps, and thousands of ships that never will be used tranquilly rest at their piers. Billions in loans have been made to foreign countries with little prospect of any recovery. More than all this is the far greater loss of human life. We are much poorer by all this, but fortunately we have resources left that with wise management will enable us in time to repair the ravages of war. Though our natural resources have been heavily drawn on, they are far from being seriously impaired. Our cities have not been devastated by bombs, and our farms have not been harmed. We still have our most valued resource—the energy and resourcefulness of the American people. The full cost of the war remains to be told, but it will be upwards of \$300,000,000,000, and the highest qualities of American character will be called into play to fill up the gap which this enormous outlay for destructive purposes entails.

Hardly of less concern than the problem of unemployment is that of threatened inflation. The very large purchasing power in the hands of the people will bid so sharply for a relatively short supply of manufactured goods that inflation of prices to a serious extent may ensue. Until manufacturers can convert their plants to peacetime production, and until they can get the materials they require, a relative shortage of goods must be found on the retailers shelves, and with large purchasing power bidding against this shortage, the stage is set for inflation. To meet this danger, the government is depending upon price control, a policy which will be aided if consumers will limit their purchases, for a time at least, to those articles most needed. Contributory to inflation is the deficit in the federal income, a cure for which is not immediately in sight. While federal outlays have been largely curtailed with the ending of war, demands on the Treasury continue heavy, and business urgently calls for a reduction of taxation, early proposals already having been made for a reduction of some \$5,000,000,000 of the annual tax levy.

While the problems mentioned and a number of others, all due to war, continue to disturb the country, they cannot be avoided so long as the world must be periodically engaged in this costly form of destruction, involving the participation of the United States in the struggle. So stupendous has been the destruction of this most recent of world wars, that the nations of the world are now making another attempt to get rid of wars altogether, or at least to lessen the frequency and scope of their occurrence. But it is realized that pending the success of this effort there can be no abandonment of measures essential to the national defense. The costs to the United States, in men

and money, of embroilment in these conflicts, enormous and distressing as they have been, are not the only disturbing effects they entail. No question is here being raised as to the necessity of our war against Germany and Japan as the only means of assuring our own safety against the aggressions of these nations. The result has assured that safety, thus of itself justifying the outlay involved. The cost, direct and indirect, and not to be regarded as without complete justification, has been too serious to be lightly regarded. We get our safety, which is a prime consideration. But we get some other results much less satisfying. Other nations obtain additional territory and reparations in kind or in money, but we get none of these, nor even ask for them. Nor do we apparently gain much goodwill even from the countries lately our Allies. We are not only expected to assume a large share of the burden of restoring the devastated countries, but to make foreign loans, the proceeds of which may or may not be entirely devoted to this end. Such loans were made in large volume during or soon after the First World War, and very few of them were ever repaid. The prospect of repayment of any loans that may be made to the foreign countries lately engaged in the war is, if possible, less assuring than was the case when such loans were made in the earlier war. Nevertheless, this country is now regarded as the world's banker and almoner—an obligation not easily to be discharged in view of our own relative impoverishment as a major participant in the Second World War. It will have to be borne in mind that we have a very heavy obligation to those who have provided the means for prosecuting the war—a federal debt already well above the huge total of \$260,000,000,000, and which in the not distant future may run considerably above \$300,000,000,000, and whose service for interest and a very moderate reduction of principal will call for the outlay of several billions of dollars annually. Still, in the face of these by no means minor difficulties, we shall have to make foreign loans in no small volume, both in aid of rehabilitation of the devastated countries and in order to promote our own foreign trade. An ancient philosopher has remarked that "difficulties show what men are," and in the light of this our present difficulties offer to the American character an unexampled opportunity of displaying its mettle.

With the co-operation that the months immediately following the end of the war had not as yet revealed, this test should be fully met. To achieve this full degree of co-operation, there will have to emerge a realization that the country is not made up of various groups with special and often conflicting interests, but that fundamentally our interests are identical—a fact recognized by the Constitution of the United States, which was ordained not to promote the special interest of farmers, wage earners or industrialists, but the general welfare. This review has no concern with prophecies, but deals only with facts and apparent tendencies. As to the significance of these facts and tendencies diverse opinions exist even among those of wide information and sound judgment, some holding that a return to general and prolonged prosperity is imminent, while others take the contrary view. As tending to support the first of these views is the abundance of purchasing power in the hands of the people, the deficiency in the supply of housing and consumers' goods, and the opportunity of supplying this deficiency which will result in business activity on a large scale, to be continued for perhaps several years.

Some factors tending to support the contrary view are the large number of unemployed, the controversies between employers and workers in industry, and the dislocations of various kinds which a great war unavoidably brings in its wake. Weighing these and other factors, it has to be borne in mind that the same degree of effort put forth in war cannot be expected to persist in time of peace.

In war there is the stimulus of patriotism, one of the most powerful incentives of the human mind. Furthermore, many of the activities of war are due to compulsion. Then, after an exhausting war, there is an inescapable reaction tending to less strenuous effort. So that the time has not yet arrived when we can look for the same unity and energy in times of peace which war inevitably brings with it. Our present situation, hardly less grave than when war was actually going on, may give rise to a degree of unity and co-operation hitherto inexperienced in times of peace, and thus make it possible to avoid threatened dangers. As has been said, our major resources and the character of our people remain without serious harm, constituting a reasonable reliance on future recovery and progress.

Some of the leading elements on which the foregoing survey rests are herewith presented: First, attention may be directed to the president's message to Congress, in which he said: "The largest single opportunity for the rapid postwar expansion of private investment and employment lies in the field of housing, both urban and rural. The present shortage of decent homes and the enforced widespread use of substandard housing indicate vital unfulfilled needs of the nation. These needs will become more marked as veterans begin to come back and look for places to live."

"There is wide agreement that, over the next ten years, there should be built in the United States an average of from a million to a million and a half homes a year. Such a program would provide an opportunity for private capital to invest from six to seven billion dollars annually. Private enterprise in this field could provide employment for several million workers each year. A housing program of this realistic size would, in turn, stimulate a vast amount of business and employment in industries which make house furnishings and equipment of every kind, and in the industries which supply the materials for them. It would provide an impetus for new products, and would develop new markets for a variety of manufactured articles to be made by private enterprise."

The director of the Office of War Mobilization and Reconversion issued the following statement: "With the collapse of Japan our preparation for reconversion was well advanced. Overnight the United States economy swung to full demobilization and expansion for peace. This abrupt change of direction brought the inevitable shock of wholesale cancellation of contracts and disemployment."

"The change in our munitions production, in terms of annual rates, goes like this:

"First half of 1945—\$56,000,000,000.

"Just after V-J Day—\$18,000,000,000.

"End of 1945—\$8,000,000,000.

"In round numbers the human effort devoted to war production or combat will have declined by the equivalent of 10,000,000 persons in the period between Japan's surrender and the end of the year. During 1946 the equivalent of another 8,000,000 will be released.

"The Reconstruction Finance Corporation has instructed its thirty-one loan agencies throughout the country to act in co-operation with the nation's commercial banks:

"1. To finance plant reconversion and equipment or plant purchases or expansion; to finance surplus property purchases.

"2. To make loans in anticipation of settlement of war contracts.

"3. To lend money to assist veterans to finance businesses or farms.

"4. To make commitments now for loans to be made at some future date so that industry may go ahead with reconversion and expansion plans.

"5. To make an automatic guaranty of bank loans to industry up to 75 per cent of a top total of \$250,000 per loan; and to participate in industry loans to any amount."

The *New York Times* figures of earnings of industrial companies for the first half of 1945 were \$784,911,500, compared with \$730,577,453 for the first half of 1944. In a similar comparison made in 1944, the combined net income of 331 manufacturing companies, totaling \$721,554,752, which was only 4 per cent above the \$691,355,626 earnings for the first half of 1943.

According to the Office of Price Administration, "In the last war from 1914 until Armistice Day, four years later, average prices rose nearly 100 per cent. Many prices rose 200, 300 and even 500 per cent above prewar levels.

"In this war, since Hitler invaded Poland, in 1939, five years ago, consumer prices have risen only 30 per cent. That's one third of the rise that we experienced during the World War One period.

"Even more impressive is the fact that three fourths of the price rise during World War Two came in the first half of the war period. Only one fourth of the price rise in World War Two has occurred in the last two and one half years."

As of mid-summer, the United States Department of Agriculture forecast the third largest food and feed output in the country's history. Based on this forecast the output promised to exceed the 1923-32 average by 21 per cent, but would be 2.5 per cent below record figures of 1942 and 1944. The forecast mentioned expected a record wheat and oats crop for 1945. As of August 8, 1945, the forecast was for a 1945 cotton crop of 10,134,000 bales, 17 per cent below the 1944 crop, and compares with an average production of 12,293,000 bales in the ten-year period 1933-44.

Federal tax collections for the fiscal year ending June 30, 1945, aggregated \$43,800,387,575, or \$3,678,627,343 more than for the preceding fiscal year.

A revised budget estimate as of July 1945 counted on an excess of expenditures for the fiscal year ending June 30, 1946, of \$46,281,000,000, compared with an actual deficit of \$53,948,000,000 in the preceding fiscal year.

ELMER H. YOUNGMAN,
Editor, Bankers Magazine, 1893-1943.

FINLAND (*Suomen Tasavalta*). A northern European republic, extending 700 miles from north to south, bounded north by the Petsamo region (ceded in 1944 to the USSR) and by Norwegian Lapland, east by the Soviet Union, south by the Gulf of Finland, and west by the Gulf of Bothnia and by Sweden.

From 1157 to 1809 Finland was part of the kingdom of Sweden. Then it was an autonomous grand duchy united with Russia, until December

1917, when it proclaimed its independence. This claim was recognized by the newly formed Soviet state, Jan. 4, 1918, soon afterwards by Sweden, Norway, France, Spain, Denmark, and Germany, and eventually by the other powers.

In 1918 a left Socialist democratic government supported by Finnish Red Guards was suppressed with great severity by White Guard forces led by Baron Carl Gustav Mannerheim, a former Czarist general of Swedish descent, with the help of 12,000 German troops. Many thousands were put to death, and 91 elected members of the House of Representatives deprived of their standing. The House, under the regency of Per Svinhufvud, then invited Prince Friedrich Karl von Hessen, son-in-law of Kaiser Wilhelm, to become king of Finland, but he declined. Finland became a republic in 1919, but under the forms of parliamentary democracy remained a virtual dictatorship. The army, and with it effective control of foreign policy, remained in the hands of Baron Mannerheim, and the Civic Guard, a Fascistlike, state-subsidized body of 100,000, enabled him to keep an iron hand on domestic policies. In the early 1930's the elements represented by Svinhufvud and Mannerheim further strengthened their control over more progressive forces through the Finnish Fascist (Lappo) movement. After Hitler's accession to power in 1933 the Finnish forces favorable to fascism drew the country into support of Hitler in planning his drive to the east. The powerful Mannerheim Line was built, commanding the approaches to Leningrad; airfields with a capacity far beyond the requirements of Finland's air force were established with Nazi assistance; joint plans were discussed in 1935 at a meeting called by Herman Goering, at which Finland was represented by Mannerheim.

On Nov. 30, 1939, following final rejection by Finland of Soviet proposals for exchanges of territory to secure the land and sea approaches to Leningrad, the Soviet Union launched a campaign against Finland which resulted some three months later in penetration of the Mannerheim Line and the capture of Viipuri (Viborg) by the Soviet forces. Peace negotiations opened by Finland on March 7, 1940 eventuated in a treaty by which Finland ceded to the Soviet Union the Karelian Isthmus and other territories north of Leningrad, and certain islands in the Gulf of Finland, in addition to a transit concession. Finland's appeal for aid (on the ground of preserving her independence and her neutrality) had its outcome in the discussion in France and England of a project for Allied intervention on Finland's behalf.

On June 22, 1941, when the Germans began their drive to the east, President Risto Ryti announced that Finland was again at war with the Soviet Union, this time in company with Germany and other nations. By the end of the year most of the territories ceded to the Soviet Union in 1940 had been retaken, and on December 7 the Finnish Parliament formally reincorporated them all into Finland. In the meantime the Finns had received a warning (which they rejected) from the United States, to cease fighting the Soviet Union or risk the loss of American friendship, and in the closing days of the year, the British after similar warnings, declared war on Finland.

The years 1942 and 1943 were marked by continued Finnish-German collaboration, especially in trade, a series of political crises due to the heavy costs of the war, and reiterated demands and proposals for peace. The position of the Finns, as economic and military allies of the Nazis, steadily deteriorated, and in 1944 Finland

capitulated. Under the terms of the armistice granted on September 19 by the United Nations, Finland agreed to restore the frontiers determined in the Soviet-Finnish peace settlement of 1940, but returning to the Soviet Union the Petsamo region which had been ceded by the Soviet government to Finland in 1920 and not reclaimed in 1940. But instead of the lease on the peninsula of Hangoe provided in the treaty of 1940, the 1944 armistice gave the Soviet Union a 50-year lease on the Porkkala Peninsula—commanding the Gulf of Finland at its narrowest point, southwest of Helsinki—and put certain airfields and the Finnish merchant marine at the disposal of the Allies for the duration of the war. The Finns agreed to pay the Soviet Union war reparations to the extent of \$300,000,000 (half the sum Russia had asked for in April), payments to be in kind, in six annual installments; to restore appropriated Soviet property; to pay compensation for property losses of citizens of other Allied nations; and to collaborate with the Allied Nations in the apprehension and trial of persons accused of war crimes.

Area and Population.—The 1944 peace terms left Finland a gross area of about 127,593 square miles, some 11 per cent of which is inland water area. The population on Dec. 31, 1942 was 3,887,217. The three largest cities, with populations for 1939, are: Helsinki (Helsingfors)—the capital—304,965; Tampere (Tammerfors), 76,730; and Turku (Åbo), 74,351. Viipuri (Viborg), formerly the third city, is in territory ceded to the Soviet Union. The Åland Islands, a group of about 300 (80 inhabited) islands between the Gulf of Bothnia and the Baltic Sea comprise a department of Finland, the data for their area and population being included in the general figures.

Government.—Legislative power is vested in the House of Representatives (Riksdag)—(200 elected members) and the President. Executive power, under the Constitution of 1919, had been vested in a president, elected for six years. The president appointed the Cabinet ministers, but was not obliged to take their advice, and controlled the direction of foreign affairs and of the armed forces. On Aug. 1, 1944, Field Marshal Mannerheim, commander in chief of the Finnish Army, was appointed president. The constitutional provision calling for election of a new president was set aside in view of the existing crisis through an amendment passed by the Riksdag; and the resolution on the appointment provided for the transfer of many former functions of the presidency to the premier, Juho K. Paasikivi.

Religion.—The national church is the Evangelical Lutheran, but full liberty is granted to those professing other faiths. At the end of 1937 (latest figures available) there were: 3,680,237 Lutherans, 70,887 Greek Orthodox Catholics and Raskolniks, 9,840 of various Protestant sects other than Lutheran, 1,755 Jews, 1,551 Roman Catholics, and 360 Mohammedans; 70,018 were not listed as members of any religious denomination.

Education.—In 1936-37 the total attendance in Finland's elementary schools was about 403,403; in the secondary schools, 50,580 (in addition to the 3,007 in the 57 people's high schools); in the 395 vocational and technical schools, providing instruction in many fields, 21,849; and in the universities (1938), 8,752—a total school attendance of about 487,591. As early as 1920 adult illiteracy had been reduced to .7 per cent. In 1937 there were 669 newspapers and periodicals in Finnish, 124 in Swedish, 83 bilingual (Finnish and Swedish) and 8 in other languages.

Defense.—In 1938 the total Finnish defense force—comprising the army, air force, coast defense, and territorial organization—included 2,012 officers and 31,000 other ranks. The air force in 1939 comprised 3 air regiments of 3 squadrons each. The naval forces consisted of a coast defense ironclad, 3 gunboats, 7 motor torpedo boats, 3 mine-layers, 5 submarines, and some smaller vessels. Military service is normally universal and compulsory, every male citizen being liable to serve from his 17th to his 60th year. Active service begins at the age of 21 and continues for one year. The Civic (or "Protective") Guards, an additional force 100,000 in number, were in respect to their command directly responsible to the president.

According to the terms of the armistice between Finland and the United Nations (September 1944), Finland agreed to restore her army to a peacetime basis within two and a half months after signing the agreement.

Resources and Products.—Although Finland's cultivated areas include only 6.6 per cent of its total land area, agriculture has been the predominant occupation, the principal crops being rye, barley, oats, potatoes, and hay. As a result of state agricultural measures, about 75 per cent of the farms have been small holdings, of from 0.5 to 10 hectares or less, owned by their users. Domestic agriculture accounts, however, for only 50 per cent of Finland's grain consumption. Because of the lack of labor, horses, and tractors, actual areas cultivated were estimated in 1944 at 34 per cent less for root crops, nearly 12 per cent less for oats and hay, and slightly less for bread and potatoes. Insufficient cultivation and the scarcity of fertilizers resulted in average and total yields that were smaller than in 1943. Stock raising and dairying are important, butter and eggs being normally exported in quantity. The forests, covering 73.4 per cent of the total land area, accounted for 44 per cent of Finland's industrial production, employed 45 per cent of the country's industrial workers, and comprised 80 to 90 per cent of its prewar exports. The most important products are timber, lumber, plywood, pulp, pulp board, and paper. Production of paper, pulp, and cellulose are reported to have shown large increases during 1943, largely to the advantage of Germany. The mills were worked at capacity and the machinery left practically worn out at the end of the war. The country's felling program for the lumber year 1945-46 called for the cutting of 52,000,000 cubic meters of wood, 54 per cent for firewood, 21 per cent small round timber, and 25 per cent heavy logs for lumber. This program exceeded any previously planned output, but the situation demanded extraordinary efforts. The demand was heavy, and industrial stocks of lumber were about 50 per cent below normal. Of the mineral products, copper is produced at Outokumpu. Granite of good quality, and limestone and dolomite are available for the production of lime and cement. Petsamo, with its nickel mines, was returned to the Soviet Union by the armistice of September 1944, forestalling future discussion of an agreement (reported April 1944) under which the Germans, who had been permitted by the Finns to work the Petsamo mines since the beginning of the war, had planned to continue to do so for the next 20 years. Industrial operations in 1944 were on the whole about the same as in 1943.

Finland's water power, derived from many river rapids, has been only partly developed.

Co-operative organization plays an important part among farmers and dairymen, and among consumers in city and country.

Finance.—Finland started its independent existence free from debt, because it did not take over any part of Czarist Russia's national debt, and had remained during the First World War practically neutral. Its so-called "war debt"—of which it paid \$250,000 annually to the United States until the severing of diplomatic and economic relations at the end of June 1944—was not really a war debt, but a debt for some \$9,000,000 worth of supplies received during the relief period after the armistice of November 1918.

Between 1940 and 1941 Finland's annual expenditures jumped from 5,105,594,000 marks to 31,000,000,000, and were expected in 1943 to reach a total for the year of 28,000,000,000 marks, of which 19,000,000,000 were attributable to direct war costs, with additional indirect war costs still to be taken account of. Total anticipated ordinary government revenues for 1944 were estimated at 15,530,000 marks, and expenditures at 29,000,000 marks. By the end of the first quarter of 1943 the public debt had reached 40,000,000,000 marks.

Foreign Trade.—Finnish foreign trade in 1944 was estimated at 15,000,000,000 Finnish marks, a considerable decline from the 1943 total of 21,593,100,000 Finnish marks. The value of imports during the year declined by 30.8 per cent, to 8,919,600,000 Finnish marks, while exports declined in value by 24.5 per cent, to 6,580,000,000 Finnish marks.

Communications.—Before the Soviet-Finnish war of 1939-40 Finland had over 39,700 miles of roads, more than half of which were of high class, and over 5,000 miles of 4.99-foot gauge railway, nearly all state owned. Finland's prewar system of lakes, connected with each other and with the Gulf of Finland by canals, had a total navigable length of about 3,000 miles and a floatable length of nearly 29,000 miles. The merchant fleet on April 1, 1938, comprised a total of 850 vessels, with a gross tonnage of 609,823, but by the end of 1941 over 40 per cent of this tonnage had been lost in the war.

Post offices in 1937 numbered 3,624. The telegraph system and the greater part of the telephone system are state owned.

Principal Events, 1945.—Finland entered the year with profound anxiety, but, as the months passed by, it became increasingly clear that defeat and virtual control by Soviet Russia meant neither national obliteration nor enslavement nor bolshevization for the little northern country. The road back to prosperity and international prestige looked long and hard to the Finns, but none of the ultra-pessimistic forebodings of the time of the armistice materialized.

Perhaps for the first time, a majority of the nation realized that Finland's future was predicated upon good neighborship with Russia. Relations between the two countries developed more smoothly than anyone had expected and by the end of January foreign correspondents visiting Helsinki were able to report that Russia's conduct under the armistice was "correct," and that there had been no conflicts (at least relatively few) between the Soviet forces of occupation and the Finnish population. Commercial exchanges, too, developed favorably, Finland receiving substantial shipments of cereals, sugar, and other foodstuffs from Russia, in return for Finnish deliveries of wood products, copper and other metals, made in

addition to the reparations stipulated by the armistice. A formal trade agreement, providing for an exchange of goods valued at \$17,000,000 between Finland and the Soviet Union was signed on May 14.

There were, nonetheless, differences that troubled Finnish-Russian relations in the early part of the year, mainly as a result of divergent interpretation of armistice clauses. Russia complained repeatedly that paramilitary organizations such as the powerful Civic Guards were not being dissolved as provided for in the armistice and that the prosecution of war criminals was lagging. By the end of the summer, Finland had complied in the matter of disbanding all "Fascistic" and "anti-Soviet" organizations, but the controversy about war criminals was still going on. Premier Juho K. Paasikivi and most of his Cabinet colleagues felt that such men as former President Risto Ryti, former Premier Johan W. Rangell, and former Minister of Commerce Väinö A. Tanner, though burdened with heavy political responsibility, could not be punished legally as war criminals. This was also the upshot of a lengthy report rendered in July by the so-called "Hornborg Committee" of the Finnish Diet, which had been assigned to investigate the war guilt of the former statesmen and political leaders. However, Ryti and Rangell were eliminated from the leading posts they had held in the Bank of Finland, and Tanner was gradually squeezed out of his hitherto dominant position in the Social-Democratic Party; other alleged war criminals were likewise removed from influential positions in the administration, business, or political life.

On March 3, Finland formalized the state of war with Germany which had existed in actual fact since September 1944. By that time, the German forces had been cleared almost completely from Finnish soil, but a few isolated groups of mountain troops continued to hold out in the long neck of Finnish territory between Norway and Sweden right up to the German surrender in May. Thus Finland was, technically at least, still a belligerent country when her 2,000,000 eligible voters were called to the polls on March 17 and 18 in the first free general election held in Europe since the start of the war. Participation was heavy—about 75 per cent—with 1,497,533 votes cast. The results of the election were in line with what had been expected but the swing to the left was moderate, bearing testimony to the absolute freedom and honesty of the poll. Finns and foreign observers alike agreed that there had been no outside interference except for a certain moral pressure exercised by the Soviet press and by a broadcast warning from Premier Paasikivi that this was Finland's last chance to straighten out her tangled relations with Russia. The final count showed 368,201 votes for the Social-Democrats, 358,988 for the newly formed Popular Front (in which the Communists were predominant), 244,384 for the Agrarian Party, 132,530 for the Swedish Party and 121,733 for the Coalition Party (Right), the rest of the votes going to various small groups of the center and right. Out of the 200 seats in the Diet, 52 were retained by the Social-Democrats (as against their previous 85), while the Popular Front won 51; this left 97 seats for the parties of the center and the right. The small Finnish Nazi Party (IKL) had been excluded from the poll.

In accordance with Finnish parliamentary tradition, Premier Paasikivi and his Cabinet resigned on April 9 after the new Diet reconvened. At the request of President Mannerheim—who did

not step down after the election as had been widely forecast—Paasikivi formed a new government which made its debut on April 17. The revamped Cabinet reflected the new political situation created by the election: out of 18 posts, 10 were given to the parties of the left (including 3 Communists and 3 left-wing Socialists) and 8 to the center and right. Carl J. Enckell, a member of the Swedish Party, remained as foreign minister and the Communist leader Yrjö Leino was named minister of the interior; the portfolio of education went to Johan Helo, another top leader of the Popular Front.

With a Communist in control of the police department, the purge of pro-German elements in the country was speeded up. On July 4, Leino startled the Diet with the disclosure of an alleged military plot to overthrow the present regime. He specifically accused the General Staff of having organized the hiding of arms and ammunition in secret depots all over the country in flagrant violation of the armistice. Following these revelations, a score of high army officers and some 200 other persons were arrested. The commander in chief of the army, Gen. Axel E. Heinrichs, was forced to resign; his post was taken over by Lieut. Gen. J. Lindquist. Apparently in connection with this affair, a thousand White Russian émigrés who had lived in Finland since 1917 were arrested for deportation to the Soviet Union in mid-July.

Finland's international position was greatly improved in the second half of the year. Following the Big Three Conference in Potsdam, which showed a tendency to deal leniently with Finland and other former Axis satellites, the Allied Control Commission in Helsinki announced on August 5 a general easing of the conditions under which Finland had been living since the armistice. Among other concessions, the Finns regained freedom of movement for their ships, both merchant vessels and men-of-war, and for their aviation; Turku and Kotka airfields were returned to Finnish control. Moving swiftly after the announcement made at the Potsdam Conference that each of the Big Three would examine separately the re-establishment of diplomatic relations with Finland, the Soviet Union on August 6 informed Washington that it had resumed diplomatic relations with Finland. On August 19 the United States recognized the new Finnish government and agreed to a resumption of diplomatic relations. In making the announcement, Secretary of State James F. Byrnes stated that, after having studied all available reports, the United States government had reached the conclusion that the Finnish elections of March 1945 had been freely conducted and expressed the democratic wishes of the Finnish people. On August 31, it was announced in Helsinki that Kalle T. Jutila had been appointed minister to Washington and Eero A. Vuori would be sent to London in the same capacity. In September, the Foreign Ministers' Council of the Big Five took up the question of a peace treaty with Finland during its first meeting in London. A treaty draft prepared by the Soviet delegation was adopted in principle by the other powers.

In September, the Finnish Diet, yielding to strong Russian pressure, passed a bill instituting special courts for the trial of alleged "war responsables." On November 15, the trial of eight former government leaders, including Ryti, Rangell, and Tanner, opened at Helsinki; it was not concluded by the end of the year. Apparently in protest against the indictment of his former associates, President Mannerheim, who

had been ill, departed for Portugal on November 4; Premier Paasikivi took over the functions of the president.

FISH AND GAME PROTECTION. See **FOREST SERVICE, UNITED STATES.**

FISH AND WILDLIFE SERVICE. As custodian of the nation's rich and renewable wildlife and fishery resources which made valuable contributions to the war, the Fish and Wildlife Service of the United States Department of the Interior presents the following condensed report on its custodial activities during the fiscal year which ended shortly before V-J Day.

The most extensive controlled experiments ever undertaken as to the effects on wildlife of DDT, the war-developed insecticide, were begun at the service's Patuxent Research Refuge at Bowie, Md. DDT is not a selective poison and, under certain conditions, may kill a great variety of animal life, including birds, reptiles and amphibians. The experiments at Patuxent are being conducted in co-operation with the Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture to appraise the biological consequences of applying DDT and to establish safe methods for its use. (See under **AGRICULTURAL RESEARCH ADMINISTRATION.**)

From service hatcheries a total of 5,740,067,985 fishes and fish eggs valued at approximately \$3,000,000 were released in the nation's streams, lakes and salt waters. During the past year a program of stocking waters near government hospitals with legal-sized fish afforded immediate recreation for convalescing war veterans.

A nation-wide system of wildlife refuges provided haven during some part of the year for at least one-fourth of the migratory waterfowl in North America. In addition to protection given many other forms of wildlife, the cultivation of refuge lands during the past year produced 555,143 bushels of grain, and other crops. Livestock grazing to the extent of 308,582 animal months was provided, 18,057 tons of hay harvested, and 222,421 fur animals trapped. Revenue from economic use on national wildlife refuges totaled \$275,555 during the past year.

The number of banded birds reported during the year was 142,569, of which 31,113 were migratory waterfowl. The grand total since the inception of the work under government auspices is in excess of 5,800,000. Recovery records to the number of 14,757 were obtained during the year, bringing the total number of these data to 346,243.

The appropriation of \$900,000 to carry on the Federal Aid to Wildlife Restoration program during the year was the lowest made to date. Shortages of personnel, equipment and materials impeded the accomplishment of planned work by the states. Despite limited co-operative funds and other impediments, the program work continued to function satisfactorily on a reduced scale. The special Federal Aid to Wildlife Restoration Fund in the United States Treasury contained almost \$11,000,000 on June 30, 1945.

The 65 United States game management agents, working singly or in co-operation with state officers, obtained 2,328 convictions, fines and costs of \$80,685.72 and jail sentences of 964 days. Undercover operations cost \$247.36 and resulted in the conviction of two persons, one of whom was fined \$500 and sentenced to 6 months in jail. Wildlife protection problems in Alaska multiplied in proportion to the increase of men

in the armed forces and in war construction work. The waterfowl control program in California proved highly successful in abating damages to agricultural crops. In other depredation areas game agents worked closely with farmers in frightening ducks from unharvested crops.

Control of predatory animals and injurious rodents resulted in estimated savings of \$27,000,000 in livestock, farm products and stored foods. These federal-co-operative operations during the year resulted in the taking of 112,451 predatory animals, of which 102,979 were coyotes, 1,365 wolves, 7,325 bobcats and lynx, 163 mountain lions and 619 stock-killing bears. To protect crops and range forage from destruction by field rodents, 11,478,829 acres of rodent-infested lands were treated, and 596,635 premises were treated to control the common house rat.

Fresh-water anglers fishing for food, as well as for recreation, brought \$9,857,229 in revenue to the 48 states and Alaska from the sale of 7,843,168 fishing licenses during the fiscal year ended June 30, 1944. During the same period hunters spent \$13,547,152 for 7,505,258 hunting licenses. Greater interest was manifested in the hunting of waterfowl by the sale of 1,426,932 "duck stamps" reported as of March 31, 1945, an increase of 257,580 over the previous year.

In 1944, Alaska fishery products totaled 331,135,017 pounds, as prepared for market, with a wholesale value of \$63,270,100. Catches of fish and shellfish amounted to 561,198,897 pounds for which the fishermen received \$20,413,525. Since the purchase of Alaska in 1867, through 1944, the fisheries of the territory have yielded products valued at \$1,481,104,110.

During the year two public auction sales of government fur seals from the Pribilof Islands were held in St. Louis. On Oct. 9, 1944, 22,393 dressed and dyed skins and 169 unfinished skins were sold for \$823,500.75; on April 9, 1945, 22,682 dressed and dyed sealskins and 4 confiscated skins were sold for \$811,992.75.

Many birds and mammals which frequent the open sea, oceanic islands, and seashores have been adversely affected, according to reports received by the service, by oil-slicks on the surface of the oceans. Sea birds, especially, have suffered, great numbers perishing from the effects. Some of the smaller islands in the Pacific Ocean used for nesting by sea birds have been so changed by the war that many species of birds have been considerably diminished in numbers, and at least one, the Laysan Island rail (*Porzana palmeri*), formerly found on Laysan Island and later on Midway, has probably become extinct because of these changes. Whales, likewise, have diminished, anti-submarine measures having inadvertently caused the death of many of them.

EDNA N. SATER,

Division of Information, Fish and Wildlife Service.

FLAXSEED. A banner crop of flaxseed for the United States was indicated in the October 1 estimate of the Department of Agriculture, which placed the 1945 crop at 35,648,000 bushels as compared with the 1944 crop of 23,527,000 bushels and the 1934-43 ten-year average crop of 21,684,000 bushels. Minnesota led with a production estimated at 12,375,000 bushels in 1945, closely followed by North Dakota with a yield estimated at 12,328,000 bushels. South Dakota was the next largest producer with an estimated crop of 4,785,000 bushels.

FLEMING, SIR (John) Ambrose, English electrical engineer: b. Lancaster, England, Nov. 29,

1849; d. Sidmouth, Devon, England, April 19, 1945. A pioneer in the applications of electrical science, Sir Ambrose Fleming contributed to the development of the telephone, electric lighting, and wireless telegraphy. He was the inventor of the thermionic valve, an important instrument used in wireless telegraphy. Sir Ambrose was educated at University College, London, the Royal College of Chemistry, and St. John's College, Cambridge University. In 1879 he served as scientific adviser to the Edison Telephone Company; from 1882 to 1894, with the Edison Electric Light Company; and later with the Edison and Swan Company. From 1885 to 1926 he was professor of electrical engineering at University College, and he also held the post of lecturer on applied mechanics at Cambridge University. He designed the wireless signal apparatus of the Marconi station in Cornwall, England, from which the first transatlantic message was transmitted in 1901. In 1904 he made the first form of the thermionic valve, one of the ancestors of the vacuum tube, which could receive or "rectify" a radio signal from space and thus make it audible to the human ear.

The recipient of many honors, Sir Ambrose received the Hughes Medal of the Royal Society in 1910, and the Albert Medal of the Royal Society of the Arts in 1921. He was president of the Victoria Institute and Philosophical Society of Great Britain in 1927, and was knighted in 1929. He was the author, among other works, of *The Principles of Electric Wave Telegraphy and Telephony* (1906); *A Manual of Radiotelegraphy and Radiotelephony* (1908); *Fifty Years of Electricity* (1921); *Memories of a Scientific Life* (1934), and editor of and contributor to the 10th and 11th editions of the *Encyclopedia Britannica*.

FLORIDA. South Atlantic state, United States; admitted to the Union March 3, 1845. Population (1940): rural, 851,623; urban, 1,045,791; total, 1,897,414. Land area, 54,262 square miles, divided into 67 counties. Chief cities, with 1940 populations: Jacksonville, 173,065; Miami, 172,172; Tampa, 108,391; Saint Petersburg, 60,812; Pensacola, 37,449; Orlando, 36,736; West Palm Beach, 33,693; Miami Beach, 28,012; Daytona Beach, 22,584; Tallahassee, the capital, 16,240.

Chief State Officers, 1945.—Governor, Millard Caldwell; secretary of state, R. A. Gray; treasurer, J. Ed Larson; comptroller, J. M. Lee; attorney general, J. Tom Watson.

Judiciary.—Chief justice of the Supreme Court of Florida, Roy H. Chapman; associate justices, Rivers Buford, Armstead Brown, Alto Adams, Harold H. Sebring, Glenn Ferrell, Elwyn Thomas.

Legislature.—The state legislature (Senate, 38 members; House of Representatives, 95) convenes biennially in odd years, on the first Tuesday after the first Monday in April.

Education.—Public elementary school departments (1943-44)¹, 1,750; elementary school teachers and departmental staff members, 7,695; pupils (grades 1-6), 247,089. Public junior high schools (1943-44), 393; students (grades 7-9), 89,732; public senior high schools, 264; students (grades 10-12), 52,855; junior and senior high school teachers and other staff members, 5,087; average yearly salary of elementary, junior and senior high school teachers and other staff members, \$1,340. Education in Florida is compulsory for children between the ages of 7 and 16, inclusive. Total state funds ap-

¹ Latest school year reported.

propriated or allocated to institutions of higher learning (1943-44), \$2,359,906. Superintendent of public instruction, Colin English.

Finances.—The following statement of finances for the fiscal year 1944-45 was supplied by J. Edwin Larson, state treasurer:

Balance in treasury, beginning of fiscal year 1944-45.....	\$ 32,458,533.99
Receipts, 1944-45	106,854,535.48 ¹
Total	\$139,313,069.47
Disbursements, 1944-45	104,034,600.98 ¹
Balance, beginning of fiscal year 1945-46	\$ 35,278,468.49

¹ These figures do not include off-setting debits and credits (transfers between funds).

Agriculture.—The yield of the leading crops of the state in 1944, with 1934-43 average crops, and the United States Department of Agriculture's October 1, estimates of the 1945 crops, are shown in the following table:

CROP (and unit of production)	PRODUCTION		
	Average 1934-43	Final 1944	Preliminary 1945
Corn (1,000 bu.).....	7,250	7,190	6,830
Oats (1,000 bu.).....	154	400	432
Pecans (1,000 lb.).....	3,288	5,100	4,307
Peanuts (1,000 lb.).....	52,928	72,800	72,800
Sweet potatoes (1,000 bu.).....	1,308	1,400	1,350
Tobacco (1,000 lb.).....	14,150	20,008	19,310
Potatoes (1,000 bu.).....	3,722	3,445	5,112
Oranges (1,000 boxes).....	26,920	42,800	50,000
Grapefruit (1,000 boxes).....	20,070	22,300	32,000
Pears (1,000 bu.).....	136	176	157
Grapes (tons).....	635	600	600

FLUORSPAR. The fluorspar industry made another creditable showing in 1944, according to the United States Bureau of Mines. Production of finished fluorspar from domestic ore was 413,700 short tons in 1944, an increase of 2 per cent over 1943. Shipments from mines in 1944, amounting to 411,801 short tons, were 2 per cent greater than in 1943, the previous record year. Although its shipments declined 11 per cent from the all-time high of 1943, Illinois not only maintained its rank as the chief producing state in 1944 but supplied 43 per cent of the total shipments. Stocks of finished fluorspar at mines and consumers' plants totaled 117,501 short tons on Dec. 31, 1944, compared with 124,959 tons on Dec. 31, 1943. Consumption of fluorspar reached an all-time high of 410,170 short tons in 1944, compared with 388,885 tons in 1943.

During the first eight months of 1945 inclusive, the production of finished fluorspar was 236,881 short tons; shipments from mines during the same period amounted to 239,487 tons; and consumption reached 265,696 tons.

FLYING. See AERONAUTICS.

FOOD AND DRUG ADMINISTRATION. The enforcement of the Federal Food, Drug, and Cosmetic Act was directed during the entire war period to the maintenance of the integrity of the nation's food and drug supplies in the face of production conditions inviting a relaxation of controls. The program was carried out by the observation of factory conditions and methods of processing and handling products, the examination of representative samples, and by appropriate legal actions.

Foods.—An intensified effort to prevent the inexcusable loss of food through exposure to insect and rodent contamination characterized the regulatory work. The fitness of raw materials, the sanitary conditions of factories, and the protection given to finished products during transportation and storage all received attention. A fringe of

the food industry requires constant surveillance because of carelessness or indifference to the obligation to produce wholesome food in clean factories. Much of the food seized in 1945, however, became filthy through storage infestation by rodents and insects after it had reached its destination in good condition. Filthy food seizures increased by 50 per cent in 1945.

Deleterious chemical substances were present in most of the foods seized on health charges. The largest number of seizures resulted from the use of chemicals to check decomposition, which would have been unnecessary had proper sanitation been maintained.

Deliberate attempts of a minority of food manufacturers to make illegal profits by deliberate cheats were suppressed by regulatory activities before the frauds gained sufficient momentum to undermine honest merchandise. Among the economic cheats seized in 1945 were foods with mineral oil substituted for cooking fat, chocolate products containing cocoa shells, debased maple and cane sirup, artificially flavored and colored "fruit-juice" beverages, and sauerkraut packed in excess brine. Major attention was given to compliance with official standards of such foods as butter, oleomargarine, cheese, canned fruits and vegetables, and jams and jellies. Other seizures on economic charges were based on short weight and deceptive packaging.

Drugs.—While the year was happily free of tragedies caused by errors in drug manufacture, seizures of violative drugs were about 80 per cent higher in number than those of 1944. Charges were fairly evenly divided between violations of official or labeled standards and false and misleading therapeutic claims. Most of the substandard official drugs were injection solutions containing undissolved particles, and surgical dressings that were not sterile. Deficiency in active ingredients was the principal violation in unofficial drugs failing to meet labeled standards; others were below requirements for purity, packaging, and labeling. The 1945 court actions involved the lowest percentage ever encountered of products claiming to cure or alleviate serious diseases, such as diabetes and cancer, which might result in fatal consequences if competent medical treatment were delayed while trials were being made of worthless "remedies."

Legislation.—For the first 2 years of the commercial production of penicillin, every batch distributed to the army and navy and that allotted to civilian physicians was pretested under a war-time plan devised by the War Production Board, with the concurrence of military authorities. This antibiotic drug, which is produced by a biological process that occasionally fails to produce uniform results, must be of the expected potency for successful use by physicians who depend upon it in cases of extreme illness. Because of its public-health importance, the Federal Security Administrator recommended to Congress an amendment to the Food, Drug, and Cosmetic Act that would provide for the continuance of pretesting after the removal of emergency controls. The penicillin amendment, receiving the full support of industry and scientific groups, was enacted in July 1945, after a unanimous vote by the Congress.

Regulation-Making Activities.—Changes in food standards in 1945 included the promulgation of definitions and standards for cacao products, identity standards for macaroni and noodle products, a fill-of-container standard for canned oysters, and an amendment to the identity standard for canned asparagus. An amendment to the identity stand-

ard for cream cheese to increase the permissible amount of moisture was refused.

Changes in the drug regulations designed to limit the prescription legend to drugs requiring medical direction were promulgated, effective as of Oct. 10, 1945. This change became necessary because of the misuse of the prescription legend in lieu of adequate directions and warnings on drugs suitable for use by laymen. Amendments were made also to regulations for new-drug applications.

Other regulations promulgated in the fiscal year included a tolerance for fluorine remaining as spray residue on apples and pears, tea standards, and amendments to sea-food plant inspection regulations.

Work for the War Agencies.—In addition to enforcing requirements for clean factories and warehouses and adequate processing controls, which is a type of regulatory work performed for all consumers of foods and drugs, the Food and Drug Administration undertook some enforcement work at the direct request of the war agencies. This included tests for compliance with specifications of all drugs purchased by the army, as well as of certain foods requiring specialized laboratory techniques for the examinations. In addition, scientific investigations were made at the request of the war agencies of the toxicity and efficacy of numerous preparations urgently needed in the prosecution of war.

Enforcement Statistics.—A total of 3,527 seizure, criminal prosecution, and injunction actions in the federal courts, based on 6,022 violative shipments, resulted from the examination of 46,959 official samples. These comprised seizure and prosecution actions on 2,665 foods, 117 vitamins and foods for special dietary use, 689 drugs, 20 cosmetics, and 1 caustic poison, and 35 requests for court injunction to restrain further violative shipments.

The highest fine imposed in the criminal prosecution cases terminated in 1945 was \$18,000. Fines exceeded \$1,000 in 44 cases and 26 defendants convicted of violations received jail sentences averaging 6 months in length. Half of these were suspended and the other 13 were actually served or are still being served with sentences varying from 7 days to 3 years.

Imported foods, drugs, and cosmetics examined totaled 19,549, of which 4,955 were in violation and were refused entry.

VIVIAN R. BOARDMAN,
Editor, Food and Drug Administration.

FOOD RESEARCH. The end of the global war brought with it a wave of optimistic predictions in the food field. The literature of the few preceding months was filled with descriptions of new and better raw foods, better processing devices, novel food combinations. These were for the most part in the experimental stage, but the promise of better things to come was unmistakable.

Electronic Heat.—This device for the rapid and uniform heating of food and other products as opposed to surface applications of heat, is finding numerous applications in the food field. It seems firmly established as an economical and highly efficient method of sterilizing cereals and other packaged dry foods. Almost as promising is the reported improvement in dehydrated foods brought about by the reduction of moisture content to 1 per cent or less through use of electronic heat. Frosted foods in large containers can be thawed rapidly and without the deterioration accompanying normal defrosting. Thus, 30 pound

cartons of fruit normally require 20 hours to defrost, but only 15 minutes in the dielectric oven.

Experiments were underway in the fall on the use of electronic heat for the pre-blanching of vegetables for freezing. The vegetables, packaged raw, are then blanched in the package and frozen immediately. The new process promises to cut down on nutritive losses which occur during the hot water or steam treatment which now precedes freezing, as well as to eliminate bacterial contamination during the cooling and filling of the packages.

Use of electronic heat in household cookery will probably not be an immediate postwar development. While many foods may be cooked by this method with excellent results, a number of problems were encountered, particularly with asymmetrical foods. Oysters, for example, heat most rapidly in their thickest part and may actually carbonize there before being completely cooked in thinner sections. Even more serious than these technical difficulties, is the prohibitive cost of installation of the device in the ordinary home, due to the necessity of high voltages for the operation of power tubes.

The Future of Dehydrated Foods.—Developed in such large quantities during the war period because of their ease of transportation, the future of dehydrated foods is open to question. Improvements in drying procedures have undoubtedly produced some outstanding new dehydrated products which are probably here to stay. Among these is the dehydration of frozen foods; i. e. the food to be dehydrated is first frozen, then dehydrated in a high vacuum, causing the ice to sublimate. The product is thus rendered bone dry without ever being exposed to high temperatures or oxygen. When rehydrated it is hardly distinguishable from the fresh material. Foods successfully dehydrated by this process include orange juice, whole oysters, clams, fish fillets, raw meats, berry juices, tomato products, coffee, milk and eggs.

Dehydrated apple nuggets, prepared by compression prior to vacuum dehydration, are one of the armies' most popular dehydrated products. Pear, cherry, pineapple and peach nuggets are forecast for the near future.

Canned Foods.—Such foods may be expected to show great improvement if recent heat penetration discoveries can be widely applied in the future. Such nonacid foods as vegetables, milk and meat products are at present heated for very long periods at high temperatures in order to sterilize the contents of the can. The time required for destruction of bacterial spores at the high temperatures of the pressure canner is only a small fraction of the actual processing time employed. Most of the long process is necessary because of slow heat penetration to the center of the can. A new engineering device has been described whereby can contents may be heated uniformly and very rapidly to the necessary high temperatures. The cans are rotated rapidly around the cylindrical axis during the heat processing. This effects continuous removal of the film of insulating material which ordinarily forms on the inside of the can, and gives efficient mixing of the contents. Green peas in No. 2 cans require 35 minutes at 240°C. to render them safe by ordinary processing methods, but only 3¼ minutes if the cans are rotated. The processing time for canned milk is now 1 hour (counting the heating and cooling period); this is reduced to 2 minutes by the new method. Great saving in nutrients and elimination of undesirable overcooked

flavor and texture result from the greatly reduced processing times.

An endless variety of new canned products have been promised by the canning industry. Already in commercial production or ready for production in the near future are canned fish loaves, whipped cream, a variety of sandwich spreads, potato and fish salads, jellied fruit and vegetable salads using low-methoxy pectins, french fried onions, baked and sliced apples, many fruit juice combinations, and jams, jellies and dessert fruits from hitherto little-known tropical fruits.

Of such tropical fruits, the *guava* has probably been most thoroughly investigated because of its remarkably high vitamin C content. Average value obtained from a large number of guava varieties by the California Experiment Station was 200 mg. vitamins C per 100 grams of fruit. Some varieties averaged as high as 500 mg. This compares to an average value of approximately 60 mg. for citrus fruits, generally accepted as our best common source of vitamin C. Experimental plantings of guavas have been made in California. The fruit is very acceptable in flavor, has a high pectin content, and may be successfully canned as a pie fruit, made into jellies or jams, or blended with other fruits in the preparation of juices and nectars for various purposes.

The Market Life of Fresh Fruits and Vegetables.—Some recent discoveries will greatly prolong the market life of fresh fruits and vegetables in the future. It has been known for several years that respiratory activity and loss of water by transpiration could be reduced greatly in many fruits and vegetables by spraying them with a wax coating. Shrivelling, vitamin losses and decay are greatly retarded by such pretreatment. It has been estimated that about 25 per cent of our citrus fruits, 80 per cent of tomatoes grown in Texas and Florida as well as a large proportion of cantaloupes, cucumbers and bell peppers are now protected in this manner before shipping. The wax coat makes the fruit look more glossy, but is otherwise not detectable.

Highly perishable fruits such as fresh figs and berries are protected from mold development by dipping or spraying with a solution of propionates. The preservative action of the propionic acid and its salts was discovered several years ago, but new applications have continued to appear at intervals. Penicillin and related compounds also await investigation as food preservatives, when the supply can be brought in line with present demands of the medical profession. Penicillin is known to inhibit bacterial growth even in minute concentrations, while at the same time it is nontoxic to human beings.

Shortening.—Fats for shortening and other cookery purposes will be far better adjusted to their intended use when the available supply becomes great enough to allow manufacturers a free hand in applying the results of recent research to the manufacture of blended shortenings for specific uses. The emulsified type of shortening which owes its emulsifying ability to small amounts of mono- and diglycerides, has already established itself. Extension of the plastic range of hydrogenated shortenings has been effected by proper control of hydrogenation and blending. Hydrogenated shortenings in the past have tended to be quite brittle at cold temperatures and soft at higher temperatures. A shortening recently developed for the army is workable at 60°F. yet still firm enough to hold its body at 120°F. The keeping quality of lards has been

greatly extended by the use of antioxidants to prevent rancidity. Four such antioxidants have been given official approval for use in fats—gum guaiac, lecithin, nordihydroguaiaretic acid and tocopherols. This development has allowed the production of bland lard from which all objectionable odor and flavor has been removed (formerly not manufactured because of its poor keeping qualities).

Vitamin Investigations.—Factors influencing the vitamin content of both plant and animal tissues have been widely investigated. Very wide varietal differences have been found in the vitamin content of plants. Strains of tomatoes have been found containing thirteen times as much beta-carotene (provitamin A) and four times as much vitamin C as the average of established commercial varieties. Great improvements in the vitamin content of common garden vegetables may be expected through selection and hybridization. On the other hand, soil type and fertilizer seem to have little effect on vitamin content, but may profoundly affect mineral content.

Hog feeding experiments have demonstrated conclusively that the thiamin (vitamin B₁) content of the meat is greatly influenced by the amount of thiamin in the diet. Extra dietary thiamin is stored rapidly in the muscles of the pig and retained well.

FOREIGN POLICY ASSOCIATION. A research and educational organization founded in 1918 to increase the interest and understanding of American citizens in international affairs. It has headquarters at 22 East 38th Street, New York City. Gen. Frank R. McCoy is president, and Miss Dorothy F. Leet is secretary. The membership of the organization is about 30,000. Approximately 233 meetings were held in New York and other cities having branches of the association in 1945, attendance totaling over 78,000. Seven new branches were added during the year.

The association publishes *Foreign Policy Reports*; a weekly *Foreign Policy Bulletin*, containing a Washington News Letter, and a *Headline Series* for use in schools and colleges. Among the speakers in 1945 were President Harry S. Truman, James B. Conant, Herbert Hoover, Joseph C. Grew, Will Hays, Miss Craig McGeachy, John Foster Dulles, Sir Bernard Pares, and Mrs. Anne O'Hare McCormick.

FOREST SERVICE, United States. The Forest Service was established in the United States Department of Agriculture in 1905, having been formerly the Division of Forestry (1881) and the Bureau of Forestry (1901). It is charged with the responsibility for promoting the conservation and best use of the nation's forest lands, aggregating nearly one-third of the total land area of the United States. It has its headquarters in Washington, D. C., with 95 per cent of its 7,000 permanent employees located in field stations. In 1945 some 1,825 of its yearlong personnel were on furlough for service with the armed forces. Chief of the Forest Service is Lyle F. Watts, who succeeded the late F. A. Silcox, Jan. 8, 1943. The service maintains 10 regional offices, a listing of which may be found in *THE AMERICAN ANNUAL* for 1941.

National Forest Area.—On June 30, 1944, the Forest Service was administering 178,940,283 acres of national forests, purchase units, and experimental areas in 42 states and in the territories of Alaska and Puerto Rico. During the war, more than a million acres of national forest lands were made available through co-operative agreements to the army and navy for military reservations, maneuver areas, artillery ranges, and proving grounds.

Purchase of land for additions to the national forest system under authorization of the Weeks Law of 1911 were practically suspended during the war. Since the beginning of the national forest purchase program in 1911, the total net area acquired to June 30, 1943, was 18,206,895 acres, costing \$68,589,185. The bulk of the national forest system is composed of lands reserved from the public domain.

Forest Management.—More national forest timber was harvested during the fiscal year 1944 than in any one previous year. Timber cut under sales to commercial operators totaled 2,821,339,000 feet board measure. Receipts collected for sales of timber were \$12,398,918. In addition, forest products not convertible into board feet were sold, valued at \$152,968. More than a hundred million feet of timber, including dead and down trees, was given away under free permits. Although timber sales to help meet wartime needs in some cases resulted in cutting beyond the planned yearly cutting budget, the Forest Service adhered to its policy that all logging in the national forests must be in accordance with methods which provide for future timber growth on the area logged.

Planting.—In 40 years the national forest area successfully planted, including replantings, has totaled 1,214,706 acres. Because of labor shortages, reforestation work was greatly curtailed during the war years. The 24 nurseries operated by the Forest Service were largely on a maintenance basis in 1945. Their normal capacity is more than 150,000,000 trees annually.

Grazing.—The grazing of domestic livestock on national forest ranges is an important factor in the nation's production of meat, wool, and hides. About 85 million acres in these forests are open to grazing and are used by ranchers and farmers in connection with some 265 million acres of crop-producing and range lands in private ownership. The private holdings dependent upon seasonal use of national forest range represent livestock and ranch investments conservatively estimated at more than \$300,000,000.

Grazing privileges are allotted by the Forest Service under a permit system with emphasis on wise and conservative range management which protects and improves forage, timber, and watershed values. During 1944 approximately 1,300,000 cattle and horses and 4,700,000 sheep and goats, not counting young stock, were permitted to graze on the national forests in the United States and Alaska. Included in these totals are about 120,000 cattle and horses and 10,000 sheep and goats which grazed on the national forest ranges under the regulation authorizing free grazing for livestock in actual use by prospectors, campers, and travelers, and for domestic milk or work animals owned by local settlers.

Recreation.—The national forests contain some 4,253 public recreation areas which have been improved with simple facilities for camping and picnicking, 254 winter sports areas, 201 swimming areas, 11 government-owned hotels and resorts, and 54 organization camps built by the

Forest Service for use by under-privileged and low income groups. In addition, welfare, religious, and civic organizations have established 311 such camps; private capital, 488 hotels and resorts; and individuals have constructed 11,529 private residences under special use permit on national forest land.

Approximately 6,275,000 people visited the national forests for recreation purposes during 1943, making use of the facilities for camping, picnicking, swimming, fishing, hunting, hiking, or riding. Nearly 270,000 were winter sports enthusiasts enjoying the skiing, skating, and snowshoeing facilities. The figure reported does not include transient motorists and sightseers who passed through national forest areas. Wartime travel restrictions and other factors greatly reduced the total number of visitors to national forests, although in some areas close to military or war industry centers, use of national forests recreation facilities increased. A number of Forest Service organization camps and other recreation facilities were made available to the military services for convalescent camps or recreation centers for members of the armed forces. With the easing of travel restrictions after the war ended in 1945, a sharp increase in recreational use of the national forests was expected. Before the war, more than 30,000,000 visited the national forests each year.
